THE impasse over the implementation of the revised scheme of forward trading proposed by the Securities and Exchange Board of India (SEBI) should not surprise anyone The history of the past 70 years or so beginning with the turning down by the Bombay Stock Exchange brokers in 1925 of the then government's offer to grant them a monopoly of organised trade in securities by a charter in return for the government assuming authority to control the rule making power of the stock exchange, has been one of constant tussles between the authorities and the share brokers over matters relating to disciplining of share trading Every attempt by the government to introduce a modicum of discipline on the speculative proclivities of the brokers has been fought tooth and nail by the latter feigning to fear official tyranny in matters of free monetary trade as they had put it in 1925 Unfortunately because of the brokers possession of great influence authority and wealth and because of the government s mistaken notion that stock exchanges serve as a barometer of the general state of the economy the government while it has been ready to strike has been unwilling to wound – even though the failure of the much touted self regulation by the brokers their monopolistic ways of functioning the bouts of unbridled speculation and the gross over trading by members of stock exchanges far beyond the resources at their command to back up their commitments have all been well established facts Right from the second world war period when the Defence of India Rules were applied in September 1943 to prohibit forward contracts and badla financing and confine all dealings to ready delivery contracts for a period of seven days share brokers have resorted to manipulative and even illegal devices to carry on speculation carry forward dealings being resumed in the end not by formal official sanction but as a result of the government s policy drift, lethargy and connivance For instance after the June 1969 ban on forward trading the J J Anjaria committee had recommended the lifting of the ban and permitting forward trading with tight controls, but the Indira Gandhi government was not impressed and the ban continued But by the middle of 1972 the stock exchanges had evolved a system under which carry forward trading was brought back in a special 'A' group of shares Officially, it was only in January 1983 more than 10 years later, that the government permitted the stock exchanges of Bombay Calcutta, Delhi and Ahmedabad to institute forward trading in delivery spells of 14 days up to a total period not exceeding 90 days from the date of the initial contract As the G S Patel committee (March 1995) has pointed out, notwithstanding safeguards in the form of daily margins, *ad hoc* margins and limits on individual holdings to control excessive speculation, frequent stoppage of work and payment crisis took place because of speculative excesses"

When there was an unprecedented rise of 838 points (or 32 per cent) in the BSE sensex in a period of just six weeks (from 2616 96 on November 2 1993 to 3454 81 on December 13, 1993) and rampant malpractices came to the surface, SEBI banned the carry over system in December 1993 With some extensions of time for winding up existing contracts the ban actually became effective on March 12 1994 This was the time when in the aftermath of the notorious stock market scandal, the Narasimha Rao government was forced to grant special powers to the SEBI which then headed by G V Ramakrishna, set about enforcing some discipline on the market for the first time Though the brokers fought the SEBI at every step they had to accept some reforms, such as 50 per cent non member directors on the boards of stock exchanges, payment of annual fees to the SEBI and most importantly, mandatory separation of clients accounts from brokers own accounts Unfortunately at this stage the SEBI blotted its copybook by moving in the direction of a derivative system of options and futures trading, when it was obvious that the proposal was both premature and far from well worked out, for without a nationwide screen-based trading arrangement sophisticated derivatives as envisaged by the SEBI was not capable of being implemented Also SEBI needed to look more closely at the experience of other countries in derivatives trading which it had not done Then came the change of guard at the SEBI and intentions of reintroduction of forward trading were announced in March 1994 though with stiffer carry over margins The SEBI also suggested that the settlement cycle for cash scrips be reduced to seven days The counter proposals of the stock exchanges, the sharp fall in share prices which induced the government to appoint the G S Patel committee to review the whole question of forward trading, the committee's recommendations and finally the SEBI's latest modified proposals for starting forward trading which have again been rejected by the stock exchanges – all these follow the familiar pattern of the stockbroking community's determined opposition to all reform and change, and the ambivalence and confusion on the part of the government

It should certainly have been possible to avoid the present deadlock and make a beginning towards restoring a semblance of stability and order in the share markets by effecting some basic changes in their functioning and in the share delivery system which would have provided a measure of assurance to investors that our stock exchanges are after all not pure gambling casinos and also made for transparency and prompt

delivery and payment in respect of share transactions But instead of firmly adhering to the reform agenda including the introduction of the depositories system, capital adequacy norms and an effective system of surveillance the government has given the impression to the sharebrokers that if they held out long enough they would more or less be allowed to have their way and the carry forward system would be brought back despite the fact that the system has been thoroughly discredited and the government and the SEBI have themselves expressed serious reservations as to its usefulness

In the sequence of events leading to the present imbroglio the role of the G S Patel committee deserves some note The perspective on forward trading and 'badla' financing of the chairman of the committee G S Patel available from different sources - the 1986 report of the high powered committee on stock exchange reforms of which too he was the chairman his A D Shroff memorial lecture in February 1987 and the report of the latest committee (March 1995) is marked by two notable perceptions First to quote from G S Patel's 1987 lecture nearly 90 per cent of the trading on the stock exchanges is sheer gambling in differences as the speculative activities permitted to be carried on in our country have no backing of either the intentions to take genuine deliveries of shares which are purchased or to give deliveries of shares which are sold In such a situation, speculation does not mobilise any fresh savings or lead to any asset formation in the industrial sector Second, the stock exchange boards as they are structured today with control firmly in the hands of brokers themselves are incapable of enforcing any self regulation To quote the G S Patel committee report the present system has unfortunately lent itself to malpractices and abuses with speculative excesses at times price rigging market manipulation non reporting of transactions evasion of margins neglect of interests of small investors etc, not so much because of its own weaknesses which it has, but more so because of the weaknesses and laxity of administration, absence of any satisfactory reconnaissance and surveillance machinery lack of back up machinery for surprise checks and periodical audit and inspection of the books of accounts of the members, absence of adequate infrastructural facilities, prolonged periods of settlement and resultant delays in deliveries and payments to the investors and overall helplessness of the governing boards in ensuring proper monitoring, regulation and control of the stock exchanges and their inability to meet crisis situations in a prompt and effective manner" Under such a dispensation, statutory curbing of speculative deals and effective monitoring and surveillance by the SEBI are a necessary condition for the smooth and orderly functioning of stock exchanges

It is known that the introduction of some system of derivatives in the form of options and futures trading is being considered as an alternative to forward trading Interestingly in this respect the G S Patel committee (1995) has come out strongly against the introduction of such a derivative system The committee has concluded thus

They have tremendous potential for evil rather than good and have brought about frequent crisis situations and made markets increasingly volatile even in advanced countries with all their automation sophistication of their systems etc Increasing use of these instruments as speculative instruments rather than instruments for risk management are also turning the stock exchanges around the globe into legalised casinos threatening their solvency stability and integrity

Against this view of speculative trading the G S Patel committee's recommendations, in particular the suggestion for introduction of forward trading, are both intriguing and indefensible The argument that the absence of forward trading has been responsible for the present lack of liquidity in the market holds little water For one thing large and continuous increases in share prices should not be expected if the economy does not achieve broad based development The rise in equity prices in 1993-94 was artificial based as it was on the liquidity injected into share markets by the investments of the FIIs once these investments dried up share prices were bound to soften Second liquidity should be a function of domestic saving which has not been growing in recent years Third it is a well established fact that the capital market has performed perfectly well during periods when forward trading has remained suspended A number of the major recommendations of the G S Patel committee are clearly at variance with the views expressed by the committee's chairman elsewhere The committee has, for instance proposed a daily margin of 15 per cent on the gross position in the first settlement, rising to 90 per cent by the fifth settlement This contrasts with G S Patel's observation in his A D Shroff lecture that 'we must introduce immediately the system of front end margins of 30 to 40 per cent for forward sales or purchases of shares or even 100 per cent in case of emergencies no speculation should be allowed in shares for more than a maximum period of one month" The SEBI's 1994 proposal had required payment of an initial margin of 30 per cent and additional margin of 15 per cent for each subsequent settlement going up to 90 per cent by the fifth settlement The SEBI has now proposed an initial margin of 20 per cent and additional margins of only 10 per cent each for the second, third and fourth settlements, with the sixth settlement leading to actual delivery or payment. It is the rejection of this proposal by the brokers that has created the current impasse True, the SEBI has also proposed a few other precautionary steps, going beyond the Patel committee's recommendations such as a limit of 25 per cent on a broker's outstanding position on any day in relation to his or her total transactions on that day and introduction of the twin-track system providing for segregation of forward transactions from cash transactions at the time of the transaction itself (instead of at the end of the settlement as suggested by the Patel committee) On the other hand, the Patel committee's suggestion for impounding 25 per cent of the profit earned by each broker from the carry forward business has not found favour with the SEBI

It is curious that both the G S Patel committee and the SEBI despite having strong reservations on the role of the carry forward system and 'badla' financing should have failed to take a closer look at the performance of the National Stock Exchange of India (NSE) The NSE's operations have exposed the vacuity of the arguments in support of the carry forward system and badla financing Without any of these tainted artifices the NSE has gradually expanded its operations in both the debt and equity segments It has also begun to work on such significant reforms as capital adequacy norms for brokers, some self financing forms of insurance for broking business and an investor compensation fund for compensating investors in the event of default by a trading member The NSE has set up committees to examine the problem of short and bad deliveries and the proposal for a national securities clearing corporation Similar initiatives on the part of the government and the SEBI would have gone a long way in reforming the capital market But had the government been serious about reforming the capital market, it was not necessary to even set up a separate NSE with the enormous duplication of infrastructure, instead the Bombay Stock Exchange could have been converted into a national stock exchange Be that as it may, the NSE's managing director has effectively put paid to the case for bringing back forward trading when recently he pointed to the experience of the NSE, "We rely on delivery and also since we are moving into more cities, there will be a large number of investors and therefore we will have more volumes which will take care of liquidity" Liquidity is essentially a function of facilities for easy trading by genuine investors which a speculative market controlled by a few large stock brokers and financiers certainly cannot provide. Is it too much to hope that at least after the present impasse, brought on by the obduracy of market operators, this basic truth will dawn on the government and the SEBI?

SAARC

Misgivings Reinforced

THE deliberations at the first meeting of speakers and parliamentarians from the SAARC countries which concluded in Delhi recently, reinforced the misgivings voiced by critics about the usefulness of SAARC ever since its formal launching in Dhaka in 1985. At the recent Delhi meeting, delegates from Nepal, Pakistan and Bangladesh demanded the reframing of the original SAARC charter to allow member states to discuss bilateral issues which are now out of the purview of SAARC (according to the charter drafted in 1985) – a demand which was vehemently opposed by India.

In fact, right from the beginning, SAARC has been dogged by the contentious issue of bilateral problems that have divided most of the member states – India and Pakistan, India and Bangladesh, India and Nepal, India and Sri Lanka and Pakistan and Bangladesh. In 1985, when the first SAARC summit took place in Dhaka, India and Pakistan were at loggerheads over the presence of Soviet troops in Afghanistan (with India supporting Moscow and Pakistan allowing the US to use its territory to arm the anti-Soviet Afghan fighters). The gulf of distrust between the two countries was further widened by reports circulating at that time about Pakistan making the bomb. The stepping up of operations by Tamil secessionists in Sri Lanka, backed covertly by the Indian government's intelligence and security agencies, strained Indo-Sri Lankan relations. Bangladesh has a dispute with India over the sharing of river waters and with Pakistan over the latter's refusal to take back the several thousand Urdu-speaking people who had opted for Pakistani citizenship but were stranded in Bangladesh, creating a law and order problem and a strain on Dhaka's financial resources. All these disputes cast their shadow over the 1985 Dhaka summit and quite often manifested themselves in veiled diplomatic innuendoes (mainly directed against India) by Jayewardene of Sri Lanka and Ziaul Haq of Pakistan in their speeches. While these smaller member states of SAARC favoured the inclusion of bilateral problems in the agenda of the newly launched forum, Rajiv Gandhi, representing the giant nation looming large over these small neighbours, persuaded them to agree to the myth that economic co-operation among the SAARC countries should come first and would automatically lead to the solution of bilateral political disputes.

The past 10 years have proved the falsity of Rajiv Gandhi's notion. While economic co-operation among the SAARC countries has made little progress, old disputes between member states have got exacerbated and new areas of contention have emerged. Kashmir is now the main bugbear of Indo-Pak relations. With Nepal, India has picked up a dispute over the entry of Nepalese workers into India. The conflict over the sharing of river waters with Bangladesh has escalated recently – to the point that one Bangladeshi delegate to the Delhi meeting, a parliamentarian, officially communicated his refusal to attend a dinner hosted by Indian parliamentary affairs minister V C Shukla, for the SAARC delegates in protest against India's refusal to give Bangladesh its due share of water. The polite consensus arrived at by the Dhaka summit 10 years ago primarily at India's behest – to keep out uncomfortable bilateral issues is about to collapse, as evident from the increasingly vociferous demands made by delegates to the Delhi meeting for a change in the SAARC charter to allow the discussion of bilateral issues.

It is becoming obvious that unless the outstanding political disputes are settled, it would be unrealistic to expect smoother economic co-operation. It will be the political environment of the region which will determine the shape and scope of regional economic co-operation in South Asia and India, being the predominant power in the region, must play an important and positive role in reducing tensions among member states of SAARC. Ironically, in most of the bilateral disputes that bedevil the SAARC countries, India is the main contender. As it is, the unequal power base and level of economic development of the different countries is an obstacle to fruitful co-operation. The problem has been compounded by India's belligerent attitude towards its smaller neighbours. As long as India persists in this attitude, SAARC can never hope to be another ASEAN (which inspired the late Ziaur Rahman of Bangladesh to float the idea of SAARC), where the member states share a certain common level of economic development are more or less free of bilateral political conflicts and do not feel threatened by any big brother from within the forum.

ROADS

Abdication of Responsibility

IT is hardly surprising that the lack of infrastructural development should become the focus of all round concern. After all, the expansion of the economy, thinly spread as it is, requires the facility of high speed communications across the country. In fact, the plans being evolved for road development show the nature of the growth path of the economy. Clearly, the objectives are to develop facilities for the movement of goods and people between large congregations of population which constitute the market for the new 'goods' being produced and sold to facilitate the exploiting of natural resources and their movement from the hinterland to the production centres and ports; and to foster the 'other' exploitation through tourism. The facts that highways peter into nothing near the villages that rim the metropolises, that a major factor in the failure of the public health system is the difficulties of transport over non-existing roads, and that all development, employment generation and poverty alleviation programmes suffer from the inadequacy of roads appears to have missed the planners' attention.

There has been much movement on the road sector especially in the last year. The government has identified some 27 road projects for private participation. In order to facilitate this process, the National Highways Act is being amended to allow for private participation under the build-operate-transfer (BOT) arrangement. The 10,000 km expressway plan to connect major metros is largely based on the recommendations of a study funded and completed by the Asian Development Bank (ADB), the major financiers for road development. While the government is pursuing the plan by calling for proposals to undertake feasibility studies, etc, the World Bank in January released its report on the Indian roads sector in which it has expressed doubts about the feasibility of the entire ADB approach. It has suggested that large private investment under the BOT scheme may not be forthcoming because road building is a high risk venture with issues such as deforestation, environmental destruction, displacement of rural populations likely to stall projects while the uncertain traffic projections render returns uncertain. Interestingly, the minister's expressway proposal has generated sufficient interest for it to go ahead with the proposal. Reports say the Malaysian Renong group has submitted a plan for developing a major portion of the expressway plan. As of now, the government has called for proposals for the preparation of feasibility studies with an assurance that the party awarded the contract for the study will also be awarded 30 per cent of the future work even if its offer does not turn out to be the lowest. While the details of these deals will no doubt come in for scrutiny and change, the fact is that large parts of the country's new superroad links will be built and operated by private, essentially foreign, companies who will collect toll for their use. Users of these dream roads of the future are not likely to be the real producers of the goods which will be despatched on these highways.

The new proposals for highway and expressway development are not a departure from the general philosophy which has guided the development of road systems in the country. For the state roads constitute in the main not communication links among people for social, cultural and economic purposes but infrastructure for the pursuit of commerce. This perspective has remained, though the absence of roads and transport

systems has greatly contributed to the dismal performance of health and employment generation schemes besides overall development programmes The ministry s annual report for instance points out that there has been slow growth of road length in comparison to the growth of vehicles The share of transport in the five year plans has come down from 22 per cent in the First Plan to 12 5 in the Eighth Plan National highways which constitute 2 per cent of the network and carry 40 per cent of the road traffic account for 0 5 per cent of the Eighth Plan allocation Even in the states expenditure on development of national highways has dwindled over the last few years as surprisingly has maintenance expenditure The government thus appears to have withdrawn from the sector even before private investment has taken its place This does not mean however that funds are being diverted to smaller road systems serving economically unimportant regions outside the range of private interests Neither the research and development efforts nor the major proposals being mooted appear to have given much thought to the development of minor road systems

This failure to address the communication needs of the large mass of the rural population is also reflected in the nature of the traffic which uses roads The ministry s annual report for instance points out that while two wheelers have grown by 16 per cent per annum during 1981 91 buses have increased only by 7 4 per cent annually The report further concedes that the unprecedented growth of personalised vehicles has been caused by inadequacy of the public transport system This is further borne out by performance data on the 69 state transport undertakings (STUs) which show that the total fleet strength has actually diminished from 1 04,500 vehicles in 1990 91 to 1,01,002 in 1993 94 with worse years in between whereas both vehicle and staff productivity has increased as also total passenger km In other words STUs are splitting at the seams suffering as they do from a fiscal crunch and general neglect The ministry's report nevertheless calls for a strategy to reduce the growth of personalised vehicles and institute measures to regulate the growth of the vehicle population and to develop an adequate and efficient public transportation system to "dissuade people from using personalised transport That public transportation is a desperately needed infrastructural requirement for the people appears to have been entirely missed Any change in the perception of the role of roads in human development is unlikely to occur in the near future And yet especially in the context of shrinking resources for social sector development, roads and communications in the rural areas or rather the lack of them will play a crucial role

US AND CHINA

Testing of Waters

FIRST it was president Lee Teng-hui of Taiwan whose visit to the US created bad blood between China and the US Now it is Madame Chiang Kai shek wife of the Generalissimo who died in 1975 She is to be the centre of attention at a reception to be addressed among others by Robert Dole Senate majority leader in the US Congress

Madame Chiang's impact on Taiwanese politics since 1975 has been negligible Nevertheless her reception in the US will further ruffle Chinese diplomatic feathers First she is a reminder of the era when Taiwan figured as one of the two Chinas' in the U S's China policy Second Robert Dole who has co sponsored the reception, is a presidential candidate and may be the next US president An additional reason for the Chinese reaction may be that Newt Gingrich speaker of the house of representatives who has a close rapport with Dole is known to support the idea of the US recognising Taiwan although his public posture on the issue is more diplomatic

The People's Republic of China was recognised by a Republican administration but the current Republican leadership is notorious for its radicalism that is, its extremely conservative stand on political diplomatic matters For example only recently this leadership ensured the passing of a resolution in the Senate favouring the lifting of the arms embargo on the Bosnian government the real target of the policy being not only the Bosnian Serbs but also the Russians who have a strategic stake in a Serb victory

In the event of this leadership assuming presidential powers it would likely further drive in the wedge between Taiwan and China with a two fold objective to hurt China economically Taiwan being the leading investor in China, and eventually to ensure a permanent separation of the two territories Such separation would be a long-term fulfilment of US strategic interests in the trans Pacific region

The response of the Chinese leaders to the visit of president Lee Teng hui to a US university showed that China will not easily countenance these US moves Not only did China recall its envoy from Washington, it carried out surface-to-surface missile tests along the Taiwanese border The tests were a warning not only to Taiwan but also to the US to keep off the issue of Taiwanese independence although as many as 30 countries already recognise Taiwan

U S recognition of Taiwan, in other words, is not a real possibility yet The only thing that can be said with some certainty is that this possibility will become stronger under a Republican administration, especially if it has people like Robert Dole and Newt Gingrich at its helm

TRIPURA

CPI(M) Digs In

BY winning a majority in the elections to the Tripura Tribal Areas Autonomous District Council in late July, the CPI(M) has consolidated its hold over the state While the state government has been run by the CPI(M), the majority of the autonomous district councils (ADC's) had been in the hands of the Congress-Tripura Upajati Juba Samity (TUJS) combine But now the voters have given a clear verdict against the combine's administration which was widely known to have been marked by corruption and factionalism

The dissension within the TUJS came to the fore on the eve of the election when Harinath Debarma the TUJS president formally split the party by announcing the formation of Tripura Tribal People's Forum (TTPF) Debarma hoped to wean away the support of the tribals from the moderates in the TUJS who the TTPF claimed had allowed themselves to be co opted by the Congress This sudden concern for the tribal cause after five years of being in power was also evinced by the TUJS when it demanded that the voters' lists be revised on the basis of the 1971 electoral rolls and names of non-tribals who had come to live in the ADC areas after that year be deleted Given that the demand was made just two months before the district council elections it was clear that the intention was to create hurdles in the way of the elections In fact, pressure was also sought to be brought to bear from the centre to make the state governor postpone the elections The decision of the Tripura National Volunteers (TNV) to opt out of the proposed triple alliance with the Congress and the TUJS and to contest the elections separately had already affected the prospects of the combine But in the event neither Harinath Debarma s TTPF nor the TNV nor the BJP was able make any impact in the elections

The polls conducted in two phases, passed off peacefully with a voter turn-out of 75-80 per cent Though the Congress blamed the CPI(M) for rigging the polls, the charge was made more out of a need to find excuses for the combine's defeat What did happen was an escalation in ethnic tensions which is now a regular feature of elections in the north-east The various tribal militant outfits not only killed and abducted non-tribals and ambushed police patrols, they also engaged in internecine warfare, against rival tribal groups In any case, the five-year record of the Congress-TUJS combine was so dismal that even their promise to provide rice for Rs 2 per kg to poor tribals and non-tribals in the ADC areas failed to shore up its political fortunes

ASEA BROWN BOVERI

Opportunities in Power Sector

ASEA BROWN BOVERI the Indian subsidiary of the Swiss Swedish engineering con glomerate is engaged in the manu facture of power transmission equipment switchgear, capacitors communication products motors process automation equipment and railway locomotives and allied equipment ABB has a 46 year history in India Hindustan Electric Company manufacturing electrical items like motors and transformers and selling imported electrical equipment was established in 1949 In 1962 the company entered into a financial and technical collaboration with Brown Boveri and Company of Switzerland resulting in the formation of Hindustan Brown Boveri which later became Asea Brown Boveri

The company recorded sales of Rs 617 crore in the year ended December 1994, up from Rs 452 crore in the previous year, a rise of around 37 per cent Other income grew by 21 per cent, from Rs 21 crore to Rs 25 crore Provision for depreciation and taxation increased by 17 per cent and 27 per cent respectively There was a non operating profit of Rs 9 crore against a loss of Rs 2 crore in the previous year, which together with lower interest costs were reflected in the healthy bottomline Exports were Rs 16 crore and imports Rs 67 crore Despite this the company had a net foreign exchange inflow of Rs 60 crore, thanks to fees earned for technical know-how The results for the year incorporate the performance of Flakt India a manufacturer of pollution control equipment, which was amalgamated with the company in October 1994 A dividend of 35 per cent has been recommended by the directors

ABB has taken over ACC Babcock a large Indian power equipment supplier and a former sick public sector undertaking under the charge of the ministry of power ABB had submitted a proposal for its takeover when the unit was thrown open to the private sector ABB has acquired 76 per cent of the equity of the ailing boiler manufacturing unit with an investment of $ 16 5 million The move reflects ABB's objective of meeting the growing demand for turnkey power plants in India

ABB has secured the turnkey order for design, engineering and supply of electrical systems for the Bokaro steel plant valued at Rs 185 crore ABB has also bagged orders worth around Rs 180 crore including one from Reliance Industries worth Rs 30 crore for its petrochemical complex at Hazira in Gujarat ABB is to partner Reliance for all future projects at the Hazira complex According to Jorgen Centerman president of ABB's automation business the order assumes significance in that Reliance will be the first petrochemical company in South Asia to introduce the 'open distributed control' technology of complete automation systems ABB is executing orders worth Rs 25 crore for Indian Oil Corporation It will supply, for the first time in India its emergency shut-down systems to the new Panipat refinery with a capacity of 6 million tonnes per annum The multinational is also modernising the process control systems in the IOC refineries at Guwahati, Haldia and Digbhoi ABB has signed a contract with GVK Industries to set up a gas based power project in Andhra Pradesh scheduled to be completed in early 1997 ABB is negotiating to set up two joint ventures for 250 mw power projects in India with the M M Bhagat group The cost of the two projects is estimated at $400 million The company has also been holding talks with the Hindujas for the engineering procurement and construction contract for the 1,000 mw coal based power plant at Visakhapatnam The estimated cost of the project is Rs 5,760 crore and the promoting companies are Hindujas Ashok Leyland and National Power of the UK The company has also initiated talks with the National Thermal Power Corporation on the Kayamkulam power project being set up by it

ABB is building a 1 330 MW gas fired combined cycle power plant in Perak, Malaysia which will meet 11 per cent of Malaysia s power requirement The company has signed a turnkey contract valued at $1 billion for the project which is scheduled to become operational by July 1997

ABB has entered into a strategic tie-up with Dalmier-Benz of Germany, the two having announced a merger of their global rail transportation activities The new entity, a 50 50 joint venture, is to be called ABB Dalmier-Benz Transportation and will offer full rail system solutions from design and engineering to assembly and project management

ABB plans to expand its business in India, with plans to make India the focus of its Asian business According to ABB officials while their main aim was to develop India as a market for their products, plans were also afoot to make the country the base for manufacturing the entire range of power equipment

ABB is getting into the area of robotics The company is setting up a robotics unit in Bangalore, with the basic hardware being imported from ABB Sweden and the rest made in Bangalore

ABB has been permitted to set up a fully-owned holding company in India The proposal envisages total foreign investment of Rs 675 crore and projected export earnings of around Rs 3,000 crore The new company will hold shares on behalf of ABB Sweden in the joint ventures already in operation in the country

HINDUSTAN LEVER

Merger Accomplished

Hindustan Lever, a dominant force in soaps and detergents, personal products and speciality chemicals has turned out an impressive performance for the year ended December 1994 Sales increased from Rs 2,067 crore to Rs 2 826 crore, an increase of around 37 per cent Total income rose from Rs 2 121 crore to Rs 2,879 crore Provision for depreciation and taxation increased by 6 per cent and 18 per cent, respectively Profit after tax was Rs 190 crore, up from Rs 127 crore in the previous year, an increase of 49 per cent The company performed very well on the export front, notwithstanding recessionary trends in the European markets and Japan and disruption of the economies of the countries which were part of the former Soviet Union Export turnover in 1994 was Rs 427 crore against Rs 234 crore in 1993, a growth of 84 per cent HLL's warehouse facilities in Rotterdam in Holland and Marseilles in France have contributed to the growth of exports The directors have recommended a dividend of 80 per cent against 56 per cent last year

A divisionwise breakup of the company's turnover presents the following picture The soaps and detergents division the company's flagship accounted for 64 per cent of the total turnover Coming second was the exports and personal products division with a contribution of 24 per cent The reduction in excise duty by 20 per cent, from 70 per cent to 50 per cent gave a boost to the personal products division and the consequent lowering of prices led

to "soaring volumes", according to the company. The chemicals and agriproducts division contributed 12 per cent to total turnover.

The process of merging Tata Oil Mills Company (TOMCO) with HLL, which had begun in March 1993, was completed on December 28, 1994. The scheme of amalgamation was also used to make a preferential allotment of 29,84,347 equity shares of Rs 10 each to Unilever Plc at a discounted price so as to retain the multinational's 51 per cent shareholding. The RBI had refused to allow the preferential allotment at a price of about Rs 103.88 per share when the market price was about Rs 700 per share. The company filed a writ petition before the Bombay High Court and the court gave an interim order which specified that the difference between the price offered by the company and that worked out on the basis of the RBI norm be kept in a separate 'share premium suspense account'. Accordingly Unilever Plc brought in a sum of Rs 209 crore of which Rs 178 crore has been kept in the suspense account.

With the acquisition of TOMCO, HLL's share of the soaps and detergents market crossed 30 per cent. High on HLL's agenda is the strengthening of TOMCO's existing brands and relaunching Tata Eau de Cologne and Revel washing powder which were being phased out by TOMCO. According to S M Dutta, chairman of HLL, the focus in 1995 will be to ensure a smooth integration, re-establish TOMCO brands and nurse its business back to profitability. HLL has incurred an establishment cost of Rs 5.4 crore as a result of the merger.

The company has some new projects on hand. It has made investments worth Rs 45 crore in three new projects. A leather tanning unit to produce finished skins has been commissioned at Neyveli in Tamil Nadu. The company is setting up a Surimi fish plant at Verawal in Gujarat in technical collaboration with Shinto Corporation of Japan. A rice milling facility in the free trade zone of Kandla, Gujarat, and a project for growing and processing catfish in Thanjavur are also on the cards.

Kimberly Clarke-Lever, the 50:50 joint venture between Hindustan Lever and Kimberly Clarke of the US, has formed two companies to manufacture personal care and hygiene products at Pune, with production scheduled to start this month. HLL is making an investment of Rs 11 crore in satellite-based information systems to leverage application of information technology and achieve a significant competitive edge. HLL is the first

consumer products company in the country to do so. The company has been awarded ISO 9002 for its rice unit, the first such facility in the country to receive the certification.

PONDS INDIA

Focus on Exports

Ponds (India), known for its range of skin care products, shoe uppers, mushrooms and thermometers, has posted a net profit of Rs 30.04 crore for the year ended December 1994, up by 33.7 per cent over the previous year's figure of Rs 22.7 crore. Net sales have grown by 16 per cent to Rs 251 crore from Rs 216 crore. The directors have recommended a dividend of 110 per cent, compared to last year's 80 per cent.

Ponds India has enhanced its market reach, benefiting from a joint selling and distribution arrangement with Hindustan Lever. The company also gained from the reduction in excise duty on cosmetics from 70 per cent to 50 per cent in the 1994-95 budget. In talcum powder, where Ponds is the market leader, volumes spurted by 30 per cent, and in skin care products by 40 per cent.

The company has been awarded trading house status for its exports. In 1994, the company's leather garments export division successfully penetrated the quality conscious markets of France and Italy. The division achieved substantial growth of turnover and profits with exports of Rs 11 crore. The leather products division, comprising shoes and shoe uppers, had another good year, with exports of Rs 38 crore, compared with Rs 32 crore in the preceding year. Hitherto having concentrated largely on the European market, Ponds is now looking to the US market. A major difference between the two, according to V Balaraman, managing director, is that while the former demands more style and variety, the latter is more volume-based. Ponds has set an ambitious export target of Rs 500 crore from its leather divison alone by the year 2005. The Pondicherry leather factory has been awarded the ISO 9002 certificate, the first shoe upper unit in the country to be so certified. By way of diversification from its mainstay, personal care products, the company entered the export market with thermometers and mushrooms. Ponds is the world's largest mercury-glass thermometer manufacturer, with a 35 per cent share of the American market and with a significant presence in the UK, Spain and other parts of the world. The company plans to increase its export turnover from thermometers, which currently stands at Rs 8 crore, to Rs 30 crore by 1998. It also plans to export digital thermometers and has created the chip design for these internally. The company's 100 per cent EOU for production of mushrooms at Ketty Valley in the Nilgiris has met international quality standards and the management is confident that the current capacity of 4,000 tpa will have to be rapidly expanded.

NHPC

Good Performance

National Hydroelectric Power Corporation (NHPC), a government of India enterprise, recorded a net profit of Rs 122 crore for the year 1994-95, as against Rs 72 crore in the previous year, a rise of 69 per cent. The total sales turnover went up by 130 per cent from Rs 236 crore in 1993-94 to Rs 544 crore for the period under review. The corporation declared a dividend of Rs 5 crore for the first time for the financial year 1993-94.

The operating units of NHPC generated 6,094 million units of electricity, registering an increase of 114.8 per cent. The 540 MW Chamera Stage I project, Himachal Pradesh, which started commercial generation during the year under review, performed satisfactorily. In the very first year of its commercial operation, electricity generated by the project stood at 2,307 million units as against the target of 1,470 million units. The smooth functioning of the northern grid last summer was largely possible due to power from this project. NHPC with six operating power plants supplies power to 15 states and union territories. The corporation has a total installed generating capacity of 1,653 MW and is one of the largest hydropower utilities in the country.

The corporation has bagged the construction job of lining of Jawahar Tunnel in Jammu and Kashmir from Beacons at an estimated cost of Rs 5 crore. It has also been entrusted with the execution of a small hydel scheme by the government of Andaman and Nicobar, and of the 45 MW Kurichi project in Bhutan by the governments of India and Bhutan. With the opening up of the power sector to private enterprises, the consultancy wing of the corporation hopes to bag major consultancy works in future. Plans to take up hydropower projects jointly are on the anvil with proposals coming from a number of leading industrial houses like Dalmia Enterprises, Escorts, GSI, etc. The corporation has made special efforts to develop the hydropower potential of Jammu and Kashmir. Four major projects with a total installed capacity of 1,560 MW have been taken up. The 690 MW Salal complex is already operational with the Uri and Dul Hasti due for completion in 1996-97 and 1998 respectively.

The corporation raised Rs 305 crore through bonds during the period under review. Expenditure incurred was to the tune of Rs 834 crore and a balance of the total plan allocation of Rs 1,278 crore would not be utilised as a result of the continued suspension of the construction activities at the Dhul Hasti project in Jammu and Kashmir. There is an outstanding amount of Rs 590 crore that a few of the beneficiary states owe to NHPC. The corporation is trying hard to recover these arrears from the defaulting states. There are plans to recover Rs 238 crore through central plan appropriation by the government of India in the course of the next four years. NHPC has taken up the matter of regulating power supply to these defaulting states with the government of India. NHPC plans to raise its authorised share capital from Rs 2,500 crore to Rs 3,000 crore and has been asked to submit a restructuring plan to this effect. NHPC is currently negotiating with the SBI Capital Services to take up the study.

The decline in the annual inflation rate has continued with the rate dipping to 7.7 per cent in the week ended July 15. There has been some acceleration of money supply growth mainly due to a sharp rise in RBI credit to the centre. The capital market continues to be sluggish with share price indices lower by 16-18 per cent over the past year. Data on social indicators show that the decline in the natural rate of growth of population has been arrested because of the tapering off of the fall in the birth rate. The all India infant mortality rate (IMR) was 74 per 1,000 live births in 1993, still a long way from the target of 60 for 2001 AD. Wide disparities persist between urban and rural areas and among states with the BIMARU states continuing to show high IMR (as also high birth rates).

COMMENTARY

WEST BENGAL

Industrial Development Policy

A Critical View

Ranjit Das Gupta

It is difficult to find any basic difference between the industrial policy of the Left Front government in West Bengal and that of the central government The pursuit of such a policy by the Left Front government cannot but weaken the struggle against the IMF-World Bank strategy, the offensive by international as well as Indian capital and the centre's new economic policy

I
The Wider Context

THE Left Front government's recent move for industrial development in West Bengal needs to be viewed in the national context of discussions and debates going on since the late colonial period and throughout the post-colonial period, particularly the early post-colonial period of the 1950s and early 1960s, on industrialisation and economic development, and social justice

The crucial issue in the industrialisation debate, whether in the Bombay Plan, better known as the Tata-Birla Plan, as well as in the first three post-independence five-year plans, was creation, protection and consolidation of a relatively autonomous domestic space in relation to the world imperialist system and foreign capital The concern was not just economic growth but self-reliant growth with social justice In the developmental strategy and policies the government was to play an active and large role The industrial economy was divided into public sector and private sector Foreign capital was not barred, but allowed selective entry

Because of the large role assigned to the government, the emphasis laid on the public sector which was to attain the 'commanding heights', the extensive power retained by the government through the licensing system and various other regulatory measures as well as the socialist rhetoric resorted to by the Congress leaders, the economy and economic policy were viewed by some quarters as socialist ones But it was basically a strategy and policy for fostering capitalist development, a relatively self-reliant one, with large space for the play of private market forces, though within some limits The existence of what came to be known as the world socialist system and particularly the Soviet Union facilitated the pursuit of such a strategy and helped the loosening of the imperialist stranglehold and creation of indigenous industrial capabilities to a considerable extent

The policy was, of course, marked by basic contradictions from the very beginning It came to be increasingly diluted since the early 1980s, if not still earlier The New Economic Policy launched in 1991 92 marked almost total abandonment of that policy in the name of globalisation and liberalisation, efficient allocation of resources and increased competitiveness This included, among others, the following

* an open-door policy towards and red carpet treatment of international productive, commercial and financial capital in its new form of multi-national companies (MNCs),
* deliberate planned retreat and withdrawal of the government from virtually all the key sectors and areas,
* curtailment and/or withdrawal of subsidies for foodgrains and virtual dismantling of the public distribution of essential commodities,
* privatisation of public sector units (PSUs),
* opening up of vital infrastructural areas and social sectors to private market forces, and
* attempted introduction of flexibility in the labour market, an euphemism for a 'hire and fire' policy

All these constitute a policy for unregulated growth and operation of capitalism

Essentially, it involves the convergence of the Fund-Bank package prescribed in the interests of international capital with the secular interests of important sections of Indian capital who had also been pressing for a similar policy

It would not be wrong to suggest that the policy being pursued is no policy at all Policy involves the putting forward of a well-formulated perspective, identification of thrust areas and prioritisation among those areas, forging of appropriate instruments and pursuit of suitable measures But all this is absent under the Rao-Singh dispensation

In justification of the new package frequent references are being made to the east and south-east Asian experiences of industrialisation and economic development in Japan, South Korea and Taiwan But the Rao Singh policy, if that can be called a policy at all, is in sharp contrast to the east Asian experience There is a large and growing volume of detailed, in depth studies showing that whatever might have been the nature of political institutions and political arrangements in none of the Asian tigers' and 'cubs' did the state abdicate its role In all these countries the state played a crucial role Using a mixture of positive incentives, instruments of control and pressure and mechanisms of spreading risks, the state performed the function of a catalyst in industrial growth In many of these countries, particularly Japan South Korea and Taiwan foreign capital did not have unrestricted entry It is striking that South Korea pursued a policy of exclusion of foreign investment for many years and did not allow the use of foreign brand names till the early 1980s Taking advantage of such protectionist measures, the growth of giant conglomerates like the Hyundai and Samsung the largest two companies, took place during the 1970s

To put it somewhat differently east and some of the south-east Asian governments exercised an industrial leadership role which is in sharp contrast with the role of the Rao-Singh government

II
Left Front Policy

The point in dwelling upon all this is to make a critical examination and assessment of the Left Front government's industrial policy ! It would not be wrong to suggest that it is hard to find any basic difference between this policy and that of the central government Some of the key components of the Left Front government's policy are

* virtual absence of any mention of promotion and expansion of government and public sector and by implication gradual withdrawal of the government from many key areas,
* privatisation of several state public sector units (PSUs) as well as social sectors,
* virtual open-door policy with regard to MNCs and foreign capital and foreign technology,
* development of the infrastructural sector through government or through private

and joint sectors, including MNCs and foreign capital;

* encouragement to almost unregulated, unbridled growth and penetration of market forces in various spheres of the economy and society, including townships, housing, health, education, hotels, commercial complexes, etc; and
* advocacy of a labour policy amounting to class peace between labour and capital.[2]

The pursuit of such a policy cannot but weaken struggles against the Fund-Bank strategy and the centre's new economic policy.

Propounded Justification

The adoption and pursuance of this policy are being justified on several grounds:

(a) West Bengal has been suffering from industrial stagnation and even de-industrialisation since as far back as the mid-1960s. Much of this was due to the licensing system which was deliberately used by the central government as a means of discrimination against West Bengal and the freight equalisation policy which militated against the natural advantages enjoyed by the eastern region. The remarkable agricultural performance in the state, the delicensing of most of the industries and partial freight equalisation have opened up new opportunities for industrial regeneration of the state. Industrial growth and technological change and upgradation are urgent imperatives and full advantage has to be taken of the new opportunities in the broader interests of the state. The new state industrial policy is also sought to be justified by projecting the hope that it would create large-scale new employment.

(b) West Bengal is not a sovereign independent republic and the Left Front government has to function within the constitutional, political and financial constraints of the Indian Union. Though many aspects of the centre's policy are detrimental to national interests, the Left Front government cannot go beyond that policy and work out and pursue a different one. Any criticism is met with the answer: 'The state cannot be allowed to be turned into an industrial desert by taking a dogmatic and unrealistic position. In other words, the Left Front government has no other alternative.'

Following the announcement of the new state industrial policy many circles traditionally hostile to the Left Front government, including many sections of business and industry as well as important sections of the media, are full of praise for the chief minister and the Left Front leadership for adopting a non-doctrinaire and pragmatic approach. Some have been euphoric about the changes in the industrial scene in the recent months. A leading mass circulation Bengali daily came out with a full-page story titled bam durge dhanatantrik biplab ('capitalist revolution in the left citadel'). Several statements and press interviews by government leaders including the chief minister himself and the West Bengal Industrial Development Corporation chairman Somnath Chatterjee have tended to give the impression that the state is already in the midst or at least on the verge of an industrial upsurge. Such euphoria was seen most at and around the time of the centenary celebrations of the Confederation of Indian Industry last January But it has been continuing since then.

Some Basic Reservations

While some aspects of individual policies may have some rationale at the micro level, one cannot but express several major, indeed basic, misgivings and reservations about the Left Front government's overall industrial policy and the ongoing changes.

In the first place, there is no doubt that under certain political, economic and social circumstances it is possible to have industrialisation and economic growth (as distinct from development) in a few countries of what is known as the third world. But Marxism does not allow discussion of industrialisation, economic growth and technological changes as well as social issues in the abstract, unrelated with and divorced from the class and social dimensions. But many of the pronouncements made by important state government and Left Front leaders exhibit virtually a non-class outlook and perspective. It is hard to find any awareness in the pronouncements and writings of the leading spokespersons of the new policy that the industrialisation policy being advocated and put into practice is basically a capitalist one and would have serious social and economic consequences. In justification it is argued that there is no option. (The validity of that argument in the form in which it is presented will be discussed below.) But there is an essential difference between such an argument and remaining oblivious of the class nature and capitalist characteristics of the industrialisation drive as well the social consequences of such a policy.

Furthermore, it needs to be stated that Marxism demands discussion of social questions in the wider historical and socio-economic context, both international and national. Without elaborating, it needs to be observed that the irony of the contemporary period is that behind the seeming worldwide triumph and 'golden age of capitalism', capitalism in the closing decades of the 20th century is in the midst of a deep crisis and has created catastrophic socio-economic conditions.

Notwithstanding some very recent indications of a moderate revival, capitalism in its North American, west European and Japanese bastions suffers from extensive and persistent stagnation marked, among other things, by what is characterised as 'jobless growth'. The reversion to capitalism in eastern Europe, Russia and the former Soviet republics has led to socio-economic collapse of a magnitude and intensity unthinkable even a decade back. China which has made a 'peaceful transition' to 'market socialism', is also experiencing, despite its remarkable economic performance, socio-economic problems unprecedented in recent history, accentuating social and regional inequalities and even alarming rise of crime. Entire continents, specifically speaking Latin America and Africa, particularly sub-Saharan Africa, are condemned to regression. Thus almost the entire capitalist world in its what may be termed the deregulated phase is exhibiting tendencies towards varying degrees of decline and stagnation.

The embracing of unregulated capitalism by the Rao government and the growing integration of the Indian economy into a world economy increasingly being dominated by the Bretton Woods twins – the International Monetary Fund and World Bank – and the newly set up World Trade Organisation and international capital organised in the form of MNCs cannot but lead to deeper contradictions in the growth of Indian capitalism with disastrous economic and social consequences for vast sections of the population, particularly the working masses.

All this indicates the fundamental global as well as national constraints within which the Left Front government has to function. This does not mean that the scope for industrial and economic development is entirely blocked for the state's economy and industry or that whatever limited scope exists need not be utilised. But given the crisis and contradictions in which world capitalism is caught currently, strikingly symptomised by the decline of the dollar, one cannot but wonder whether a broad-based vigorous capitalist industrialisation, not to speak of an industrial revolution, is at all feasible and achievable in West Bengal.

A no less, if not more, important point is that of the relationship between the currently pursued policy and the long-term perspective of bringing about a radical socio-economic transformation. Particularly noteworthy is that not only the state government but even the Left Front parties tend to maintain a silence about this relationship as well as the basic direction of the changes being sought.

Difference from Rao-Singh Policy

Another important issue is that of difference between the Rao-Singh economic policy and the Left Front government's

policy It is not that there is no difference An important feature of the Left Front policy is that it follows, despite limitations, the implementation of fairly extensive land reforms, considerable decentralisation of governmental power and functions through the panchayat system (not achieved, in fact not even attempted in any state other than Kerala with regard to land reforms and Karnataka in relation to panchayats) and significant agricultural performance Another important feature is the emphasis put on cottage and small industries and their growth But leaving aside these aspects it is difficult to find any fundamental difference with the Rao Singh policy and practices

It is being repeatedly stated that West Bengal is not a sovereign independent republic But in case the Rao government is replaced in future by a government having Left presence or a government over which the Left has influence would the Left parties particularly the CPI(M) press for a radically different policy and pursue that? Some of the public pronouncements made by the West Bengal chief minister himself and other important spokespersons of the state government indicate that the current policy is being viewed as irreversible

West Bengal's industrial situation of having experienced decline and stagnation for over three decades or so is a critical one It is often said that at the time of independence the state occupied the first place in the industrial map of the country But it was essentially a weak lopsided and limited industrialisation with export-oriented processing (e g jute) and plantation agriculture (tea) and extractive mining (e g, coal) occupying the first three positions Engineering largely related to wagon-building was another major industry It is only with the launching of a few public sector enterprises like the Durgapur steel plant, the alloy steel plant and the Mining and Allied Machinery Corporation in the Durgapur area that the industrial map began to change its colonial character But for various political, economic and social reasons, by the mid 1960s the process came to a halt and after that the industrial scene came to be marked by rapid decline and pronounced stagnation

Other Reservations

It is against the background of industrial stagnation and decline that the industrial policy announced last September and pursued since then by the state government is expected to bring about an industrial resurgence Some of the basic misgivings about the 1994 policy have been mentioned above But there are other reasons too for having reservations

During the first nine months of 1994, the state received 140 applications for industrial approval involving an investment of Rs 1,045 30 crore. Between 1991 and September 1994 the state received 682 industrial approvals involving an investment of Rs 12 383 66 crore inclusive of Rs 3,600 crore for the Haldia petrochemical complex (Government of West Bengal *Economic Review* hereafter *ER 1994* 95, p 36)

These are impressive figures, but there are several important questions to which answers are not readily available One, there is a distinction between applications received and approvals and between approvals and actual investment But the West Bengal government's *Economic Review 1994-95* does not give much information about all this Available reports suggest that most of the applications which have been approved are yet to be translated into actual investment According to one estimate, taking the country as a whole a mere 20 per cent of the direct foreign investment approved since 1991 has flowed into the country There is no reason to consider that the picture in the state is different from this

Two it is officially admitted that at least a number of the investment memoranda are marked by indecision and uncertainty The *Economic Review* presents a list of 17 MOUs signed by the West Bengal Industrial Development Corporation (WBIDC) between April 1994 and January 26, 1995 Of these in five cases even tentative locations have not been finalised (*ER 1994 95*, pp 37, 39-40) These include, among others a Rs 800 crore industrial complex comprising ship-breaking, ship-repairing, cargo-handling and port Ship-breaking is very important for getting scrap as input for mini-steel plants a segment of the iron and steel industry identified as a thrust industry in the 1994 policy declaration Further, ship-breaking, ship-repairing, cargo-handling, etc, are highly labour-intensive But all this needs very large areas with various infrastructural facilities However, such areas with appropriate facilities are yet to be selected and developed (*ER 1994 95*, p 37)

Three it is being claimed that no foreign or MNC and NRI investment is being allowed to be made in non-priority, non-basic industries But even a cursory glance at the lists of MOUs and projects in the pipeline presented in the *Economic Review* (which do not give much detail and even particulars and names of the parties with whom the MOUs have been entered into) reveals an entirely different picture Here are a few examples West Bengal Pharmaceutical and Phytochemical Corporation, a public undertaking, has signed an MOU with a US firm, Biomedica, for producing the ayurvedic anti-diabetic drug 'Eusolin' and other ayurvedic products (*ER 1994-95*, p43) One cannot but wonder what was the need for collaboration with a foreign firm for producing ayurvedic products The giant MNC Unilever is entering into many areas through its subsidiaries, Hindusthan Leve and Brook Bond Lipton India (BBLIL). Th latter is launching a Rs 70 crore foo preparation project (*ER 1994-95*, p62). Doe it involve a technology which cannot b researched and developed indigenously or if necessary, purchased from abroad? A few of the MOUs have been signed for projects which can by no stretch of imagination be considered as industrial or manufacturing projects For example, an MOU has been entered into with a Singapore-based company for setting up a Rs 500 crore shopping mall in Calcutta and another Rs 350 crore MOU with an NRI is for a residential-cum-commercial complex near Calcutta (*ER 1994-95* pp 37, 40) Essentially, it amounts to a deal for real estate development

Four, even in some areas which have been identified as thrust areas not much progress has been made One example is the Rs 600 crore Integrated Leather Complex In fact, talks have been going on for quite some time for developing the complex and shifting the tanneries from their present location in east Calcutta to Bantala, a few kilometres away in South 24-Parganas But the tannery-owners are reluctant to move, one major reason being the failure to develop adequate infrastructural facilities, including roads, power and water supply (*ER 1994-95*, pp 37, 76)

The Rs 700 crore Haldia petrochemical complex to which the US-based Chatterjee-Soros Fund Management is to contribute Rs 300 crore by way of equity participation is a much-talked-about project But in this case too much progress has not been made Those who are in the know of things hint that Chatterjee-Soros Fund Management is not serious about the Haldia complex, but has been able to secure a plot of land for a Rs 1,000 crore 'information technology park' and another plot for a Rs 350 crore residential-cum-commercial complex (*ER 1994-95*, p 37) – again two non-manufacturing, non-industrial projects – by dangling the carrot of the Haldia petrochemical complex One cannot but raise the question Is the Chatterjee-Soros Fund Management also really after real estate business?

Five, no estimate or even rough indication of the possible extent of job creation in a state burdened with huge unemployment and job-loss due to industrial stagnation and decline as well as sickness and closure of industrial units is available

It is still possible to argue that, given the constitutional, political and financial constraints, from the early days of assumption of power in the state the Left Front government was beset with the difficult and formidable problems of bringing a turnaround in the situation and that no other options were available

Yet the Left Front policy could have been radically different from what was announced last September. This is not wishful thinking divorced from ground realities. In fact, the Industrial Policy announced by the Left Front in 1977 on first assuming governmental power had a distinctly, in fact, a radically different perspective.[1]

It stated, among others, the following: "The major goals of the Left Front government over the long run should be (a) reversal of the trend towards industrial stagnation (b) arresting the growth of unemployment and providing for increased employment in the industrial as well as agricultural sectors (c) encouraging the growth of small and cottage industries, (d) lessening the stranglehold of monopoly houses and international firms on the economy of the state (e) encouragement of indigenous technology and industrial self reliance (f) gradual expansion of the public sector and (g) increasing the control of the actual producers that is the workers over the industrial sector. Further: The different goals mentioned above are interconnected. The announced policy having several interrelated components proposed a number of specific measures and instruments some in a fairly detailed manner for attaining the goals mentioned above.

A similar policy perspective was reaffirmed in some of the early Left Front government documents. For example even after acknowledging the constraints of the state government the *Economic Review 1980-81* stated: "The basic constraints on production ... are rooted in the unequal distribution of the ownership and control of productive assets in the different sectors of the economy. The essence of [the] policy measures has been to try to reorder within the limited powers of the state government this pattern of distribution in favour of a more equal situation. These measures therefore had to be redistributive in nature not simply for the sake of redistribution but, more fundamentally, in the interest of production itself." (*ER 1980-81* p 1, para 1.4)

With respect to the major private sector industries the same *Economic Review* spoke of the 'constraints ... rooted in the structure of ownership and control of the industry' and stressed the need for taking definite steps at the state level 'to achieve some social control in the ownership and management of specific industrial units' (*ER 1980-81* p 32, para 4.2).

Post 1977 Performance

But to the best of this writer's knowledge the 1977 policy and a few *ad hoc* moves such as formation of workers' co-operatives in the initial years were not followed up by any coherent leadership and thinking, working out of appropriate instruments and organisational steps and well-coordinated, consistently pursued concrete measures for translating the policy perspective into practice.

With regard to the state public undertakings the 1977 policy document had stated that these must operate at demonstrable levels of efficiency be free from corruption and generate surplus. The employees in these undertakings – workers as well as managers – must not be caught in a vicious trap of low productivity high costs, erosion of net worth and general indifference. With reference to the need for training and skill acquisition the policy document had stressed that 'workers must rapidly equip themselves with skills and knowledge so that they might be associated with the efficient running of these enterprises.

The document also specified the way in which the PSUs might be restructured. To quote: 'The Left government must critically review the performance of these PSUs rationalise and restructure them where necessary and put them under professional management. Continuing the document stated: their accountability must be established not by bureaucratic controls but by setting clear financial goals and physical targets and continuously monitoring their performance. But nothing was done at the ground level to put these policy guidelines into practice.

The result has been the dismal state of affairs of the state PSUs. By 1991-92 as many as 60 out of 70 public undertakings had been saddled with huge and mounting losses (*ER 1991-92*, Statistical Appendix pp 146-55, Table 6.26). Even enterprises like Gluconate India formed in 1987 and the only indigenous producer of certain life saving drugs like Pathedine, have over the years been incurring losses. Teesta Fruit Vegetable Processing formed in 1986 and belonging to a thrust area in terms of the recent policy declaration does not have any manufacturing facilities and has been making losses. Sunderban Sugarbeet Processing Co, belonging to the same thrust area has stopped production after a court order under the Environment and Pollution Act. The West Bengal State Leather Industries Development Corporation (1976) belonging to another identified thrust area with considerable growth potential has been making losses (*ER 1993-94*, Statistical Appendix pp 146-55, Table 6.25). In many if not most of these 70 units, the centre's discriminatory policies like industrial licensing and freight equalisation can by no means be held responsible for their poor financial performance. The responsibility lies very largely if not primarily, with the failure of the state government to provide industrial leadership and forge suitable instruments for implementing the 1977 policy declaration.

With regard to small-scale industries, in respect of which the state government claims notable performance and progress, even the government data reveal a steadily declining performance over recent years. Thus the number of small-scale industrial units registered with the state government's Directorate of Cottage and Small Scale Industries declined from 28,846 in 1990-91 to 14,923 in 1992-93 and thereafter to 13,217 in 1993-94 and the employment figure fell from 1,63,132 to 83,871 and then to 76,035 in the same three years (*ER 1994-95*, Statistical Appendix p 143, Table 6.22). In this sector too the major default appears to be that of the state government.

These are some aspects of the post 1977 Policy performance and no attempt has been made to examine and assess it in the light of the experience gained reformulate it and work out appropriate instruments and corrective steps. Curiously enough, in the current discussions and debates there has not been even a casual mention of it. It appears that the 1977 Policy document has been given a quiet burial.

III
Issue of a Different Policy

But even in today's extremely difficult and complex overall context – the demise of the socialist system the worldwide onslaught of international capital and imperialism in its new phase the disorientation among socialist and progressive forces and the defensive position in which the working class and working masses have been put – the Left Front government in West Bengal has the potential of playing a critical role. It is against this background that the Left Front government's industrial policy becomes particularly important. To reiterate despite the presence of formidable constraints it was and is still possible to work out and project an industrial policy distinctly different from the current one. Such a policy could pose a counterpoint to the Rao-Singh policy and strengthen popular mobilisation against the latter. In the remaining portion of this note a few indications of such a policy are presented in a schematic and synoptic fashion.

Regulation of Market Forces

Despite planning the large role of the state and bureaucratic control throughout the post-colonial period private capitalist market forces have been in operation and thriving at various levels of the Indian economy and society. Following the

those forces have been rapidly advancing in various spheres West Bengal too has not been free from this and could not remain so even if it wanted to But an important question is will unbridled play and penetration of private market forces be allowed by the Left Front government?

These need to be contained checked and regulated The Left Front government can introduce encourage and foster new forms of non statist non dirigist but public as well as non corporate non private forms In contrast to the typical capitalist form of enterprise run with private profit motive the corporate form the Left Front government can encourage and promote co operatives of various types - producer co operatives marketing co operatives credit co operatives etc – as against statism and bureaucratic control as well as unregulated marketism In fact the state does not lack at least a few examples of successful producers co operatives Tantuja in the handloom sector is perhaps the most notable instance Similar co operatives in other areas too can be encouraged to be formed It is not that the September 1994 announcement on industrial development or subsequent statement by the Left Front does not make any mention of such co operative enterprises But this is not accorded much importance and has not yet been followed by any significant concrete actions and measures

True, organisation of industrial co operatives is beset with serious operational financial marketing and related problems But there is the Kamani Tubes case of worker take-over and running of a sick industrial unit Even in this state there are several examples of worker s co operatives (for example, New Central Jute Mills Budge Budge, Wire Machinery Manufacturing Employees Industrial Co-operative Society Panihati International Automobile Co-operative Workshop Calcutta Satyajug Employees Industrial Co operative Society North Howrah Hosiery etc) The Sangrami Shramik Union of Kanoria Jute workers put forward a fairly detailed scheme for organising a co-operative which could not be launched due to various obstacles not the least in importance being the state government's apathy and the hostility of the CITU and the INTUC the two most important trade unions in the state In the case of marketing, (i) provision of alternative marketing channels controlled by the people which could threaten and contain speculative and profiteering private market forces, and (ii) establishment of direct links between the actual producers and the consumers as well as the markets should have an important place in the Left Front government's policy The government could also explore the formation of managers' co-operatives in case of sick units and provide facilities to these the units.

Even in social sectors like health and education launching and running of non-profit hospitals/health/diagnostic clinics and educational institutions on co-operative basis and through cross subsidisation could provide cheap and excellent medical and educational facilities to the poor and non-affluent sections That such schemes are feasible is shown by the running of several well known hospitals/clinics in Tamil Nadu, Karnataka and Maharashtra Instead of providing facilities to greedy private entrepreneurs for opening highly expensive hospitals educational institutions for catering to the needs of the affluent the Left Front government can provide support in various forms to such non profit organisations and thus project new alternatives

Left Front Government s Role

In the changed international and national context and under pressure of various agencies oriented to private market forces the Left Front government need not abdicate its role but needs to function as a catalyst and play an active role in rejuvenating the industrial economy of the state Briefly, such a role involves among other things, the following

(a) Market forces need not be eliminated or even suppressed, but are to be used as well as contained through a mixture of control and regulation provision of positive incentives and spreading of risks The Left Front government can put forward the perspective of developing a synergistic relation between public institutions and private market forces and play a leadership role in the industrial scenario of the state

(b) It is vitally important to identify the thrust areas and industries The chief minister s announcement has identified several such industries for example petrochemicals electronics and software But among several such areas it is necessary to prioritise the identified thrust areas and provide necessary support and facilities That indecision and uncertainty do persist even in relation to thrust areas like tannery, ship-breaking and mini steel plants has already been referred to

(c) As the Haldia petrochemicals project and electronics, two of the several thrust areas are high-tech capital-intensive industries having limited employment potential, no less important is the need to protect and revive traditional highly labour-intensive industries Jute manufacturing is one of these This industry has been ailing for a long time due to several international and domestic factors, one of the most important among the latter being that the mills have been in the future of the industry. The industry was condemned as a sick one Even the much publicised Arthur D Little scheme for industrial revival considers the future of the industry bleak

But the reality is that the industry has good prospects and the United Nations Development Programme in co-operation with several other agencies is working on policies and measures for the revival, modernisation and diversification of the industry However, the chief minister's announcement fails to make any mention of this industry and the Left Front government is yet to work out any worthwhile plan for the industry Similar is the government's position with regard to another major traditional but ailing industry the engineering industry which needs extensive restructuring modernisation and technological upgradation

Given the magnitude of unemployment in the state it is also important to select and promote industries with large employment potential

(d) It is imperative for the government to thwart the entry of predatory interests and greedy operators The jute industry has been plagued by fly-by night operators who not only flout all norms and laws with regard to labour but also act against the long-term interests of production and the industry

Tea plantation in north Bengal is another industry which has drawn interests attracted by the prospect of large and quick gains These have ranged from a large company like Duncan Agro Industries to new operators who are virtually grabbing tribal land, paddy and agricultural land and land under the Teesta command area through persuasion enticement in the form of high prices for the land and promise of jobs in the gardens as well as overt and covert pressures The point is that all this is being done by (i) flouting all existing laws, rules and regulations with regard to transfer of tribal land and conversion of agricultural land to plantation land, and (ii) evading the Plantation Labour Act and other laws relating to provident fund, ESI, etc Local protests have taken place and reports exposing these practices have appeared in newspapers, including the CPI(M) daily *Ganashakti*, but almost nothing has been done till now to prevent them These are areas which call for early government action

Issue of Privatisation

In the current context of increasing penetration of private market forces and undermining of public enterprises the latter can and must continue to have an important place and role However, for that it is necessary to have a differentiated approach

(i) Chronically loss-making non-viable units

need to be gradually phased out with adequate protection to worker interests. (ii) Some units, particularly those in businesses and services like tourism and hotel industry, may be privatised (iii) The remaining state public undertakings should be restructured and run along sound business lines In fact, much of what was said of the restructuring of these enterprises in the 1977 Policy with emphasis on democratic functioning against narrow political interference and bureaucratic control and on professional management and accountability remains relevant even today

That the PSUs are not sacrosanct and that some of them may have to be privatised has been suggested above But a few relevant questions are the following Why privatisation? In which areas? Through what methods?

One example may be of help in this regard Much controversy has arisen on the issue of handing over the ownership and management of Great Eastern Hotel to a French organisation Acre Asia Pacific That the government should not normally be in hotel business is by now accepted in all quarters But there are two points one minor and the another major

The minor one is that till 1991 92 out of 67 state PSUs Great Eastern Hotel was among the eight showing a positive return [4] So why privatise it? But much more important is the method of privatisation Why Acre Asia Pacific and why not Peerless or the ITC-Welcome group or any other organisation? What is the basis of choosing the French organisation? It smacks of a clandestine deal There has not been any competitive bidding or call for tenders The point is that the method of privatisation of PSUs must be transparent both at the central and state levels

Here is another example of the peculiar methods of privatisation With a pledge to reopen and run a closed factory the National Tannery, the state government purchased the unit through the Calcutta High Court But though the government took possession of the factory in November 1992 it has not opened it yet In the meantime the government has moved the high court for (i) permission to sell it to a private promoter and (ii) an order to the effect that it will never be made liable to pay the arrears due to the workers [5]

It is possible to give some more examples Allotment of prime land to real estate dealers on various pretexts is a much discussed one But such methods need to be given up

Foreign Capital and MNCs

(a) There is no question of barring the entry of foreign capital altogether But there should not be any indiscriminate entry which may lead to serious problems Here is one example A few years back R G Brearly, claiming to be a resourceful British entrepreneur, was allowed to take over four jute mills under arrangements never made public and given a red carpet welcome by top persons in the Left Front government But Brearly turned out to be a mere speculator out for just asset-stripping and real estate deals

The government must be cautious in dealing with foreign capital and foreign entrepreneurs Only those foreign concerns which (i) have substantial resources and are willing to make the requisite investment, (ii) are strong in R and D, and (iii) have professional management and the necessary expertise should be allowed entry into carefully selected areas

(b) With regard to MNCs too the government would have to be careful MNCs may be necessary for getting access to foreign markets and for acquisition of new technology But in dealing with MNCs, pressure needs to be put on them so that, among other things (i) the bulk of their products are exported, and (ii) the necessary inputs are mobilised from within the domestic economy whenever they are available Such policies have been pursued by South Korea and Taiwan along with strict enforcement of national laws

Last year completely by-passing the State Planning Board (SPB), the state government authorised the Boston-based management consultancy firm Arthur D Little to draw up a perspective plan for West Bengal s industrial promotion It seems that the status of the PSB, like that of the Planning Commission has been devalued and it has been reduced to the position of a state government department It is difficult to understand this undermining of the PSB If necessary help and advice from foreign consultancy organisations may be sought, but an organisation like the State Planning Board can and must play an effective role

Workers Interests

The issue of workers' interests is a vital one While trade unionism unmindful of workers' duties the productivity issue and wider social responsibilities has to be discouraged, it needs to be stressed that under the Left Front government thousands, if not lakhs, of workers have been rendered jobless due to closures and lock-outs as well as systematic retrenchment and blatant evasion and flouting of labour laws and regulations A number of retrenched workers have been driven to actually commit suicide Further, the wage earning working masses have been under severe attack from the employers and have been pushed to the wall The Left Front government must protect the legitimate interests of the working class and working masses Some non-viable, chronically loss-making units may have to be closed down and with technological upgradation and modernisation some workers may be rendered surplus. But it is necessary to work out schemes for redeployment and retraining of such workers and in doing this the state government has to play a significant role

IV
Concluding Observations

To sum up, though the Left Front government has several achievements, particularly in relation to land reforms and the panchayat system, its industrial policy and practices have been seriously flawed and have not been basically different from those of the central government

It appears that capital, both foreign and indigenous, is engaged in an aggressive drive for imposing its hegemony under the protection of the Left Front government But despite the many constraints within which the state government has to function, there is considerable scope for projecting and pursuing a radically different policy which can turn out to be a counterpoint for popular mobilisation and struggle against the Fund-Bank package, the offensive by international as well as Indian capital and the Rao-Singh economic policy

Notes

[This is an extended version of a presentation made at the AITUC/ILO Workshop on Economic Policies Development and Social Justice' in New Delhi from March 22 to 24, 1994 I have benefited from discussions with Sushil Khanna and Saila K Ghosh and I thank them]

1 For the full text of the chief minister's statement on the Left Front government's Industrial Policy announced in the West Bengal state assembly see *Ganashakti*, September 28, 1994 It is revealing that the statement was made without any prior discussion in the Left Front For text of the Resolution on Industrial Policy adopted at the West Bengal State Conference of the Communist Party of India (Marxist), see *Ganashakti* March 4, 1995

2 *Economic Times*, Calcutta, August 24, 1994 published a report that for the Haldia petrochemical project a tamed labour force had to be created through careful selection and recruitment of workers and installing a pliable trade union in the plant

3 The 1977 Industrial Policy for West Bengal' was published in full in *Social Scientist*, January-February 1978 pp 103 08

4 *ER 1992-93* Statistical Appendix Table 6 26, pp 148-57 The financial results of the hotel for 1991-92 showed a profit of Rs 27 69 lakh and a cumulative profit of Rs 127 58 lakh But, curiously enough, in 1993-94 it incurred a loss of Rs 109 71 lakh and had a cumulative of loss of Rs 1 83 lakh

Industrialising Bihar: The Options

A K Roy

The new guidelines for industrial development of Bihar which the state government is engaged in framing should consider all the available options for achieving industrialisation so that what emerges is a genuine alternative to the dismal policies of the centre and Bihar is able to give a lead to the whole country, something so long vainly expected of West Bengal

THERE is a well entrenched impression outside that Bihar, even after having all the potential to become a leading industrial state, is destined to remain feudal with its backward agriculture and awkward people. However, after the Janata Dal's coming to power for the second time there have been moves to give industrialisation the first priority. An ambitious target of securing investment of Rs 15 000 crore in the state by industrialists has been announced and the chief minister has embarked on a foreign tour to attract capital.

There are two ways of industrialisation and the options should be debated before final decisions, which will have a decisive bearing on subsequent development, are taken. The first option is to invite industrialists to bring capital to invest in the state. This way is now popular and different state governments are competing to extend facilities and announce concessions and exemptions to entice industrialists. Bihar has also taken the initiative in this regard, with the chief minister addressing the Confederation of Indian Industries in Delhi on April 25, an open house meeting in Patna on May 26 and a meeting of the chief minister with leading industrialists of Bombay on June 13. The second option is to involve the working class to harness internal resources for investment. This is the self-reliant indigenous way of development. This process starts from below and then goes upwards. Here it is more important to visit the industrial centres in the state than foreign countries and to address conferences of workers and trade unions than those of owners of capital, to motivate them to play a new creative role. The technical humanpower, including scientists, technologists and engineers, available in the state should be invited through seminars and meetings to take up the challenge.

Those who are connected with production or research know how hollow is the first way, though it is now becoming a craze in our country, thanks to our unproductive politicians. No country in the world has developed by borrowing capital or importing capitalists. What is capital? Skill will and the morale of the people is capital. Can they be brought from outside? A social environment has to be created to release social energy to drive the wheels of industrialisation. This country in general and Bihar in particular has everything. What is needed is a new philosophy. Bihar has industrious humanpower which is found in every corner of India. It has very large mineral resources accounting for 42 per cent of the country's reserves including coal, iron ore, copper, manganese and uranium, among others. The state also hosts prestigious research institutes like the PDIL and MECON and engineering units such as HEC. Here the problem is not lack of capital but non utilisation of the capital. This is true of the whole of the country including West Bengal.

The question is raised, where is the money? The Bihar government has no money. Even without pointing out to the ministers' extravagance and the high pay and perks of legislators, the counter question arises from where do industrialists get money? They get money from the banks or raise it from the capital market. Why can't the government do the same? The credit-deposit ratio of banks in Bihar is only 37.8 per cent compared to 68 per cent in Maharashtra and more than 100 per cent in Delhi. So Bihar has the right to ask banks to give money for investment. The real fear is that the money would not be productively used. That means the government has no faith in itself. Then the government has no right to govern either.

Money has functions four, as all economics undergraduates know, but what actually matters is purchasing power which must not outstrip the supply of goods in the market. But here also the actual situation is the other way round. There are commodities but no purchasing power. Thus there is an accumulation of more than 30 million tonnes of foodgrains in the FCI's godowns and pithead stocks of coal exceed 40 million tonnes. Similarly, textile mills are closed for want of buyers of cotton cloth and so are the cement, vanaspati, paper and asbestos mills of Rohtak Industries in Bihar itself. So even if some extra money or purchasing power goes to the poor workers, how can that adversely affect the market if the holes in the public distribution system causing prices to rise are plugged?

II

Before any step is taken for industrialisation, correct knowledge about the position of industries at present is required. But the Bihar government has no report about the number of industrial units running in the state and those lying sick or closed, the causes of sickness, the amount of capital blocked and the number of persons unemployed as a result. The statement of the industries minister of Bihar in the assembly in this budget session did not throw any light on the matter. According to the union labour ministry, out of the total 256 lakh working people in Bihar in 1991, some 111 lakh were engaged in cultivation, 95 lakh were agricultural labourers and 3.2 lakh, 4.5 lakh and 5.8 lakh respectively worked in mines, household industries and organised industries. According to a recent report, out of 325 big and medium industrial units in Bihar 67 had been referred to the BIFR and of these 17 had been recommended for sale, including HEC of Ranchi. But these 67, apart the condition of the other units is not known. Similarly, out of 1 66 000 small scale including handicraft units, about 49 000 are lying closed. Generally, south Bihar is known for industry and north Bihar for agriculture. But even in north Bihar industrial estates have been established in every district with Muzaffarpur as the headquarter. Thousands of acres of land have been acquired and crores of rupees of loans have been advanced. But these industrial gardens have withered away and the industrial units are lying closed. For prescribing the correct economic and political remedies the condition of the patient must be known. So the government must come out with a white paper on industries in Bihar giving all the relevant information so that proper guidelines can be framed for industrialisation.

For deciding the priorities in the process of industrialisation also there are two approaches. One is to bring new industrialists and start new units in new places. This approach is now popular since it has a vote value. The second is to start with existing units, whether running or closed. In Bihar where it is not that there are not a sufficient number of industrial units but that these are not in good condition, the second approach is definitely to be preferred for various reasons. First, the existing units can be reactivated immediately with relatively small resources as the infrastructure is already there. Second, if the state's house in regard to existing industries is set in order that would itself attract new investors and investment without the government having to run after them. Third, if the disease is not known and cure is not certain, then adding new industries will only mean more potential patients to those already there in the industrial hospital. Laying foundation stones and putting up new sheds without producing anything lead not only to waste but also to the opening up of new channels of corruption in purchasing raw materials like coal, steel etc at concessional rates and then disposing them of in the black market. In Dhanbad district there are so many such fake factories. Opening closed units is itself the biggest source of capital in Bihar.

The industrial units are in three sectors, public, joint and private. Like charity,

[illegible] start at home – with the public sector, taking first the state electricity board which alone incurred a loss of Rs 313 crore in 1993-94 The board produces and distributes electricity, making losses in both activities With an installed capacity of 1,440 MW, actual generation is only around 300 MW, i e 20 per cent compared to the national average of about 55 per cent What is more about 45 per cent of what is generated is pilfered through unauthorised connections Do we need multinationals to deal with these problems? Where theft and negligence are the problems what can high technology do? If West Bengal once famous for load-shedding can become surplus in electricity without calling in any capitalists why not Bihar? If Laloo Yadav has decided to go foreign' following in the footsteps of Jyoti Basu, why does not the electricity minister visit the power generating units following the example of Shankar Sen the West Bengal power minister? Next comes state transport, another white elephant eating up Rs 23 crore in 1993-94 By ending corruption in the depots and repairing roads this loss can be wiped out in six months Money for repairing roads can be collected from the vehicles using the roads as is being done in Madhya Pradesh A study on fuel economy by a group of engineers has shown that simply by repairing the roads transportation costs can be reduced by 30 per cent

There are 59 industrial units in the state public sector with a capital investment of Rs 3 000 crore apart from land and other immovable properties There are also outstanding loans of Rs 1 200 crore to them The losses of these public sector units so far exceed Rs 1 000 crore The sick public sector industrial units include the prestigious Sindri superphosphate factory the electrical equipment factory in Ranchi the scooters projects and the silk mills in Bhagalpur To the list has now been added Rohtas Industries of Dalmianagar producing many things of public utility The government is looking for buyers or, more appropriately, scrap dealers to dispose of these units without exercising its mind over rehabilitating them In the government's Rs 2 500 crore Plan budget there is no mention of any spending on that The extent of the spiralling losses of these units will be clear from one example The Sindri superphosphate factory, the first public sector industrial unit to be set up in Bihar at a cost of Rs 2 crore on 51 acres of land with office, factory and living quarters and with all infrastructural facilities like road and rail communications and supply of water and electricity, was closed in 1989 – after yielding production and profits from the late 1950s – simply for the lack of Rs 20 lakh for repairs Due to dithering the amount soon rose to Rs 50 lakh and now the chemical plant is completely ruined after remaining idle for five years It is being said that its renovation would cost Rs 12 crore in addition to Rs 2.5 crore for payment to the workers for the period the [illegible] remain idle. Every day of delay increases the cost of rehabilitation Three factors are important for rehabilitation availability of raw materials, marketability of the finished products and suitability of the technology Where these conditions are fulfilled the work of rehabilitation should be started immediately When two of the three conditions are satisfied, it may take some time There may be doubts and differences of opinion where only one or none of the conditions is satisfied However, most of the public sector industrial units to be put back on their feet in Bihar fall in the first two categories

III

According to the new economic policy announced in July 1991 the government will not run industries rather industrialists will run the government How industrialists will run the government will be tested in the coming election but the way they have been running industries has already become a matter of concern for all If nationalisation has failed privatisation has proved worse The Tatas and the Birlas are the two top private business houses The Bihar government after taking over one private sector closed unit Kumardhubi Engineering Works in Dhanbad district, handed it over to the management of the Tatas for its running However, the magic of private management failed to click and the factory is now getting closed again The same is the case of an alloy steel unit in Hazaribag district where in the guise of joint sector the Birlas were inducted into the management So this is a class phenomenon The comfort loving creamy layer of the country which produces the top officials and employees has become thoroughly incapable of shouldering responsibilities and taking risks and so has become unfit for both the public sector and the private sector and are fit now only for the scam-prone self'-sector

So now when the private sector is ailing and the public sector is failing what should be the new pattern Bihar should aim for in industrialisation for proper use of capital and labour? The motive behind publicising the failure of nationalisation is not re-privatisation, as is commonly believed, but internationalisation by tying industries to global interests Hence the search for multinationals to take charge To pave the way for smooth transfer of our 'industrial sovereignty' a suitable psychological environment is being created by propagating an alien culture through English-medium education and the CNN-tied electronic media, infecting the growing generation from childhood So there are the GATT agreement and foreign tours in the course of which one chief minister, NTR of Andhra Pradesh, is reported to have even praised British colonial rule in India without evoking much protest at home – something which would have been unthinkable even a decade ago

If re-privatisation is something to be worried about, then internationalisation of industries and the industrial potential of the states, for which the chief ministers are undertaking their tours abroad, is a far worse alternative This country has had sad experiences with multinationals before and after the Bhopal gas disaster which exposed both their ineptness and social callousness Now has come the Enron episode The obnoxious terms brought to light show neither better management nor greater economy and efficiency and the whole project has become unpalatable even to a government which cannot certainly be called anti-industrialist The same spectacle is being enacted in Bihar where for the Piparbar project of Central Coalfields an Australian company has been brought in as the super-management and it has brought even a driver from Australia at ten times the pay of an Indian driver, reminding one of the early days of British raj and making a mockery of our constitutional provision assuring equal pay for equal work Capitalists, to be sure, start industries not for charity but for profit But indigenous industry creates employment and adds to self-confidence, it also generates surplus leading to the setting up of other industries But if industries are brought from outside, they lead to closure of indigenous industries, create unemployment and erode self-respect More capital is drained out as surplus than is brought in Now we have to choose who to follow Dadabhai Naoroji or NTR The problem is compounded by the latter being the chairman of the National' Front, even after causing the biggest affront to national sentiment

So when private sector managements, government officials and multinationals have failed, what option is left and which class is to be depended upon for industrialisation? The only class that can be relied upon is the working class Not only should there be workers participation in management as enjoined in the Constitution but workers must have a share in ownership, either partially in the form of a joint sector or fully through workers' co-operatives In all closed units workers' dues should be converted into equity, making them the owners of the units when they restart In all new units, whether in the public or the private sector, at least one-third of the shares should be reserved for workers with an effective say in the management There is a notion that workers are anti-production, propagated by the elites who are themselves now the most unproductive overheads in society A survey of sick industries in Dhanbad showed that the closure of only 6 out of 110 closed units in the district had any connection with the labour disputes

The new guidelines for industrialisation which are to be framed in Bihar should consider all these options Let there be a new start with an alternative to the dismal industrial policy of the centre and let Bihar give a lead to the whole of country, so long vainly expected of West Bengal

Homage to an Honorary Taoist

THE raging polemic on the nature of science and its relationship with social development is not a very recent one And though the 19th century may be characterised as one wherein the notion of the value neutrality of science appeared to have been widely prevalent within the community of scientists and their public, even then voices of dissent were fairly common For example it appears today that the dedicated programme France was to embark upon, having to do with the founding of an innovative scientific and industrial research system dates back to the troisieme republique An era marked by presence of renowned scientists such as Pasteur and Berthelot In this burgeoning age of state sponsored scientism the voice of protest was that of Francois Brunetiere, a protest that was characterised by a romantic rebelliousness and that contested the providence of the New Atlantis In other words the rhetorical promise of science was offset by the aberrations that distinguished the portrait of an emerging technological civilisation

However towards the 1920s and more concretely by the 1930s a very different kind of movement was taking root within the scientific circles of Cambridge - a movement that took congnisance of the problematic nature of a value neutral science of the manner in which science came to be implicated in politics a case in point being that of the science of racial hygiene or the eugenics programme, and in tune with the crisis marking the post first world war years where science for the first time science was caught in the act (to use a later day Oppie ism) of doing 'the Devil s job'

The movement counted amongst its ranks a brilliant bunch of scientists who initiated a serious examination on the social relations of science, in the hope that they would be able to decipher the conditions and structures required to ensure that the benefits of scientific knowledge and technological advance would diffuse equitably among all sections of society, and further that these benefits would be accessible to all As has been well documented in the literature, these scientists included J D Bernal J B S Haldane Hyman Levy, Joseph Needham and Lancelot Hogben The programme drew its inspiration from radical socialist politics and through their writings and active participation in left wing politics they attempted to give substance to their vision of the distinctive place of science in socialist transformation and the idea that science progressed best under a socialist system, for among other things it would not be vulnerable to the commoditisation that threatens it under the capitalist system

Through their popular writing on the sciences they were able to provide a new direction to the then prevalent thinking on science and politics as Europe trotted perilously into the ominous 1930s In what follows I shall not discuss the group as a whole and their role in articulating a critique of eugenics or the activity of the trade union of scientists founded by them (AScW), for this has been dealt with in detail in a now extensive corpus of writing and Werskey s classic (1978) has done the subject adequate justice Joseph Needham's (1900 95) fundamental contribution to altering the perspective of a generation and his canonisation as a very important cultural figure will be the subject of subsequent discussion

Popular recantations of the intellectual biography of Needham trace back the origins of his fascination with the history of science to the textbook he wrote on *Chemical Embryology* in three volumes and that contained a 300 page history of embryology As a bookmark, that surely is an interesting point but the historian of ideas would ask whether it is possible to identify in this transition the seeds of the Needhamian project, in other words was Needham's signature already evident While prowling around for pre-Marxist influences on Needham, it is rather interesting to discover that Needham was fairly impressed by George Sarton s work (1927 48) on *Introduction to the History of Science*, where for the first time he encountered a detailed mention of the contribution of Chinese civilisations But as Thackray and Merton (1972) have pointed out, as far back as 1927, Needham first approached Sarton for advice on the history of embryology

It would be relevant here to say a word about Sarton,* for then in contrast we would be able to appreciate Needham's path a little better George Sarton was the first to give the history of science both its professional and cognitive identity The history of science was for him dominated by a philosophic conception that consisted in demonstrating inductively 'the unity of knowledge and the unity of mankind', [illegible] enframed by the scientism of the end of the 19th century This is one of the reasons why in the post-second world war years with the demise of positivist and Eurocentric conceptions of science, Sarton's conception of the history of science has been shelved

If one were looking for prefigurations of what came to be considered Needham's 'embracing vision', in his early work, then it becomes necessary to forefront the fact that even as a biologist he was looking for non-reductionist ways of researching the biological world, and this recognition of the limits of reductionism was to percolate into his decoding of the science and society relationship As the Japanese historian of science Shigeru Nakayama and the physicist Maurice Goldsmith (1966) have pointed out, in this evolving vision of Needham, contra positivism, the history of science was to be integrated with economic and social history, not in any reductionist or deterministic sense Science was to be considered as part of the fabric of society, and not an "autonomous delving into nature's mysteries"

Between Sarton's inauguration of the professional discipline of the history of science in the 1920s and Needham's formal decision to embark on the history of the sciences of China in 1938, there is a watershed event in the external history of science, and this had to do with the International Congress on the History of Science and Technology held in London in 1931 The meeting proved historic on more than one count On the one hand the papers presented by the Soviet delegation, particularly the one by Boris Hessen on Newton's Principia and its social and economic context, were to open up the discipline afresh historians of science, within the Marxist mould had a new exemplar for approaching the science society relationship And the group of British scientists under discussion were influenced by the approach presented at the Congress Secondly, they were able to maintain ties with their colleagues from the erstwhile Soviet Union, and were subsequently duly impressed by the Soviet efforts in science and planning This programme was to serve as a template for a number of nations freeing themselves of the yoke of imperialism, in the planning of their societies

In the 1930s Needham came to be introduced to the language and culture of China through his Chinese collaborators, such as Lu-Gwei-Djen at Cambridge Over the years he had spent at Beijing he was able to give substance to the project that was later to prove monumental He arrived in China in 1942 and was there till 1946 as Director of the Sino-British Co-operation Office Between 1954 and 1980 five volumes of *Science and Civilisation in China* were published Without going into the details of this gargantuan exercise, I shall briefly touch upon two or three fundamental issues in his work, the questions of historiography that came up along the way, and the manner in which it was to reshape the perceptions of the non-west

Sociological approaches to the history of the sciences have informed us of the manner in which the questions posed by historians of science are themselves determined in the central preoccupations of their own times. In fact, a remarkable illustration of this genre of sociology is Loren Graham's contextualisation (1985) of Hessen's reading of the social frame within which Newton's Principia appeared. (Shades of Heller's Rembrandt painting Aristotle contemplating the bust of Homer.) Such an undertaking in the case of Needham would be an enormous undertaking beyond the scope of this note and the author's abilities. Nevertheless, as far as Needham's times were concerned I shall tentatively venture two hypotheses. Firstly, by the 1920s and certainly by the 1930s the idea that science was a self-validating discourse produced in the west had just about run its course – and despite the Vienna Circle, the shaky foundations of the Kantian arch of knowledge was becoming increasingly apparent. Secondly, for those who reluctantly either went along with the neutrality of science hypothesis, or its instrumental variant, the use-abuse model, or for those in the crisis-ridden 1930s who wished to rediscover in the scientific renaissance a new humanism, the idea that the scientific revolution in Europe was the major landmark in the recent history of civilisations became a central preoccupation. The history of science on the other hand had to reckon with a situation where the internal accounts of science were unable to offer an adequate account of Europe as the privileged site of the scientific revolution.

It was into this space that Needham and other external historians of science moved in. Internalism was unable to address "the intellectual, philosophical, theological and cultural systems of the Asian civilisations". In Needham's own words "the great stumbling block here for the internalist school of historiography of science is the central question of historical causation. Scenting economic determinism under every formulation, they insist that the scientific revolution, as primarily a revolution in scientific ideas, cannot have been derivative from some other social movement ...they do not like to admit that scientists have bodies, eat, drink, and live social lives among their fellowmen". Elaborating the framework of Marxist social history of science, Needham was to point out that gunpowder, paper and the magnetic compass were to play a central role in the transformation of European society, for the arrival of gunpowder marked the end of European feudalism and the magnetic compass in the hands of western explorers launched the modern capitalist age. And yet, these were all discoveries of science in China that emerged from the experiments in alchemy and geomancy undertaken by Taoists. A situation wherein a set of techniques could produce different responses within different cultural systems implied that there were no properties immanent to either science or its methodology, rather the values and culture of the society are imparted to the science, and decide the course of the science and its dissemination within society.

This led Needham to ask two sets of questions. The one was but a logical consequence of a post-positivist conception of science, and had to do with the premiss that different cultures read phenomenon of nature in ways which are decided by how they derive their priorities. In fact, a couple of years ago the journal of the history of science *Isis* did a recapitulation of the historiographic upheaval that followed in the wake of Martin Bernal's recent work. David Pingree in his paper (1992) that appeared in the volume reconfigured a central proposition that Needham was articulating, that while civilisations exchange scientific knowledge, each civilisation subsequently transforms what it receives along entirely new lines. Needham himself put forward this proposition in a specific context, that of a discussion on the Chinse discovery of magnetism: "The Chinese were so much in advance of the western world in this matter that we might almost venture the speculation that if the social conditions had been favourable for the development of modern science, the Chinese might have pushed ahead first in the study of magnetism and electricity, passing to field physics without going through the stage of 'billiard-ball' physics." Needham obviously gives away in a moment of weakness to his predilection for field theoretic approaches in favour of corpuscular physics

The second question betrays a foundational epistemic commitment of modern science as a cultural universal Which is why it is problematic, and there are those who rightly wonder whether it could be asked at all. His close to romantic fascination with China led him to wonder why if in scientific and technological terms China was far advanced over the Europe of 1400 AD, it failed to develop a modern scientific culture similar to that of Europe. The causes for the non-occurrence of an European variant of the scientific revolution Needham traced to the social organisation of knowledge and the social relations of production within Chinese society. Working out of a canonised causal model that purported to explain the conditions responsible for the scientific revolution in Europe, Needham suggested that within traditional Chinese society large-scale hydraulic works were under the control of a centralised bureaucratic state. Technology under such circumstances served the role of securing the power of the emperor against fissiparous forces. Secondly, unlike in Europe the rise of modern science in China was inhibited by the political impotence of the Chinense merchant class, which within traditional Chinese social hierarchy was the least esteemed class, while it was this class in Europe that played a fundamental role in furthering the scientific revolution. In the literature this has come to be referred to as the Needham thesis. As suggested above, this modality of interrogating the past of China was premised on the central assumption that if science was part of culture it was also common to most cultures.

The assumption came under attack from a host of positions, expressing romantic reservations about science as well as what might today be classified under the rubric of ethnosciences, we shall come to these objections a little later. We shall first refer to the concerns of those who drew their inspiration from Needham's cultural universalism. In non-European contexts Needham's oeuvre became a source of inspiration for the reconstruction of the cultural resources of a diversity of cultures and nations. (In India, within certain circles a lament often heard relates to the absence of a Needham equivalent in India. And any number of attempts have sought to redress this void, if so it were.) The central question posed within this framework, in non-Europe was of the following nature: "...to what extent was the appearance of modern science in other areas of the world a consequence of cultural factors, and to what extent was it a concomitant of the non-development of specific socio-economic conditions associated with the privatised profit-motive of capitalism?".

These efforts were possibly the consequence of the alignment of the reconfigurations under way in these non-European societies, that had just broken away from colonial rule. Needhamian ecumenism, or the idea that modern science visualised in historical time was a "product of many civilisations and the common property of all mankind", struck a resonant chord among third world intellectuals of a progressivist persuasion. However, the presentism evident in his ecumenical metaphors has often rendered Needham vulnerable to the charge of temporal solipsism, that he sometimes suspends historical context. A typical passage that endears and simultaneously distances reads: "If one defines science as modern science only, then it is true that it originated only in western Europe in the 16th and 17th centuries in the late Renaissance, the life of Galileo marking the turning point. But that is not the same thing as science as a whole, for in all parts of the world ancient and medieval peoples had been laying the foundations for the great building that was to arise". However, in another passage from *The Grand Titration*, the metaphor of the tributaries and streams of knowledge neutralises some of the ahistoricism evident here. Matthew Gutmann feels that this temporal solipsism is not in tune with the general tenor of Needham's work. This might surely be the case, for the problem resides within the project of the history of science itself – a point made within another tradition of the history and philosophy of science and expiated by Bachelard as well as Canguilhem, of how the past of science would present itself as different from the newer horizons of scientific theory. There is thus a dialectic of tanslation, seen as "the creation of a link that did not exist before and that to some

extent modifies two elements or agents", and the research frontier of science

However, for those outside the ecumenical picture of science the Needhamian thesis carried little weight One way of summing up the argument of Claude Alvares (1979) is to suggest that transcultural evaluations are not possible and that science in each culture is an ethnoscience that western science emerges is the measure of civilisational achievement when a culture sets the domination of nature to be the highest norm This is an argument put forward in a different form by S H Nasr (1976) in drawing a distinction between modern science and the sacred sciences of the past The project of modern science for him commences in a desacralisation of nature, and it is the notion of gnosis in the eastern civilisations that has inhibited aggression and warfare In the foreword to the fifth volume of *Science and Civilisation* Needham responded to this romantic outburst for he saw in it the constituent elements of the romanticism of the 1930s

Responding to radical cultural relativism and it is easy to recognise the ghost of Nazi Germany in the background, Needham was to write There is a danger to be guarded against the danger of falling into the other extreme and of denying the fundamental continuity and universality of all science This could be to resurrect the Spenglerian conception of the natural sciences of the various dead non European civilisations as totally separate immiscible thought patterns more like the distinct works of art than anything else a series of different views of the natural world irreconcilable and unconnected Such a view might be used as the cloak of some historical racist doctrine the sciences of pre modern times and the non European cultures being thought of as wholly conditioned ethnically and rigidly confined to their own sphere, not part of humanity s broad onward march Further besides raising the bogey of radical incommensurability that rejects the possibility of common understanding between cultures and the likelihood of mutual exchange it denied these non European cultures the contribution to the universal body of learning To the argument concerning the desacralisation of nature Needham responded that such a reading overstressed the metaphysical determination of scientific ideas and theories and underplayed the role of social and economic pressures And finally there was no historical evidence to support the fact that the east was any less free of conflict and warfare to be counter posed to the essentialised aggressive west armed with the weapons of modern science

In a piece written under the pseudonym Holorenshaw (1974) about himself Holorenshaw referred to Needham as an 'Honorary Taoist' (or Daoist Here he mentions that he had spent his life s efforts in attempting to bridge three irreconcilable contradictions On the one hand, there was science and its apparent opposite religion then he attempted to show that the religious impulse was not incompatible with his socialist politics, a reconciliation that a number of Needham scholars attempted to grapple with Kovel (1989), for one refers to him as a Christian communist, for he was simultaneously a practising Christian and a devoted communist His Christian piousness, Kovel was to allude to as "pantheistic mystical Christianity' his brand of communism Goldsmith (1976) would call "idiosyncratic Marxism And finally, he worked towards the reconciliation of the east and west, opposing very strongly the broad brushing of the 'Orient under one rubric without respecting the differences between the various cultures and civilisations that it contained

Today scholars are wary of Needham's sometimes uncritical faith in dialectical materialism that it lacked an appreciation of the human subject, of his belief in a dialectics of nature predicated on a philosophy of nature that did not specify where the human order differed from the natural order, of a holism that sometimes ignored the specificity of the parts and yet he is often seen as opposed to the "entire post Cartesian tradition of academic discourse This rather novel manner of situating Needham does not merely come from his rejection of the cumulative model of the growth of scientific ideas of his rejection of value free science and his commitment to an organicism that departed from the idea that science was the primary instrument for the subjugation of the inscrutable forces of nature and reconceived it as the activity that aspired to bring nature and human beings into harmony This post-Cartesian departure in Needham s historical reconceptualisation resides in his dialectical apprehension of science and the newer horizons set by contemporary scientific theory or as Gutmann says the ever contemporary manifestation of science, viz modern science – he is thus able to circumvent static Cartesian categorising

I have not gone into the details of the life of Joseph Needham, that was interesting in its own right nor extensively deliberated on the political side of his personality which was equally enigmatic For in the 1930s he along with Bernal and other members of the Cambridge Left had turned to the erstwhile Soviet Union and Soviet science for it provided a concrete alternative to capitalism Half a century later he was to ruminate about the days when the Soviet Union still had the dew on it and since then it is becoming fairly evident that there are some techniques and practices that socialism could usefully take from capitalism, and there is a general move in China, Hungary Yugoslavia, etc. towards a mixed economy ' As Marxist and internationalist he supported the Maoist revolution in China And it was through his studies on Chinese science that within the domain of western scholarship he was able to institute the importance of investigating ' the regional-traditional sciences" as the very precondition to ecumenisation" The Marxist who believed that a Christian must take Marxism extremely seriously, who spoke through his alter ago Henry Holorenshaw of how he was liberated from the Gnostic and Manichean heresies "which attributed all evil to matter, and took all sex as sin" Having been liberated from this religious opium, he found it necessary to extricate himself from the clutches of the Eurocentrism underlying the positivist conception of science – "scientific hashish" And so Holorenshaw asks 'Without these liberating influences, how could Joseph Needham have found such sympathy for those who felt the numinous quality in the symbolism of Krishna's sport with the Gopis, or above all responded in China to the great Taoist affirmation, I Yin i Yang wei Tao?"

Note

* Politically Sarton was of a Fabian socialist persuasion and was influenced by Shaw and Wells

Appropriating Environmental Concerns

Suman Sahai

Environmental issues have been included in the agenda of the World Trade Organisation despite the near unanimous opinion among environmental groups that liberalisation of global trade would itself be ecologically damaging. Environmental issues are already being misused to set up protectionist trade regimes that will selectively benefit developing countries.

APART from the obvious problems facing the environment today, an emerging matter of concern is the way in which the environment is being hijacked by trade and commerce bodies like GATT and WTO and how environmental issues are being misused to set up protectionist trade regimes that will selectively benefit the industrialised nations. This trend must be resisted by developing countries and the problems of the environment seen in a genuine context so that sensible efforts can be made to conserve what is left.

The final act of the GATT Uruguay Round had taken definitive steps in linking trade and environmental standards and set up an extra committee to look into this. At Marrakesh where GATT ended and WTO began, the ministerial meeting ratified the inclusion of environmental issues as part of the WTO agenda. This was done despite a unanimous opinion among environmental groups that liberalisation of global trade would be ecologically damaging. It is a matter of great concern that the WTO is including several other issues that have nothing to do with trade in its agenda. The WTO chief Ruggiero himself has made a public commitment to place such non trade factors like environment and social clauses high on the list of the WTO's agenda. This was clearly to benefit the powerful industrial nations and destroy whatever advantages the developing countries might have.

A discussion on environmental matters is not within the purview of WTO. As a matter of fact it is not even equipped to deal with these issues. There are several separate international bodies to discuss the environment, as there are to discuss all the other factors that the GATT/WTO is attempting to appropriate like intellectual property rights and labour standards. There is for example the International Labour Organisation (ILO) to deal with problems of labour and the World Intellectual Property Organisation (WIPO) to sort out the problems of patents, copy rights and other forms of intellectual property protection.

Environmental fora however are the most numerous. Some of the more prominent ones are the UN Commission on Environment and Development (UNCED), the UN Environmental Programme (UNEP), the International Union for the Conservation of Nature (IUCN) World Wide Fund (WWF) for Nature. Apart from these there are several smaller national and international efforts. Given the large number of environmental bodies already in existence, and the competence with which they are handling global environmental questions, it is difficult to justify the dragging of environmental standards onto the WTO platform.

Despite this, if the WTO wants to link environment with trade Gene Campaign believes that it must be with retrospective effect. The damage to the environment inflicted over the last 50 to 100 years by the industrialised nations to bolster their production, enhance their trade and establish their mega economies will have to be taken into account when determining how environmental concerns will relate to trade.

The WTO is aware as is everyone else that 20 per cent of the world's wealthy located in the north consume 80 per cent of the world's natural resources and spew out 80 per cent of its pollution. It is obvious that a trade environment link forged by the WTO should also include conditions like the transfer of environment friendly technologies from the industrialised to the devloping nations so that trade and development in those countries that need it most, does not adversely affect the environment.

By reserving the right to deny the WTO forum to industrialised countries that refuse to share benign technologies the WTO would send a powerful signal that it is serious about protecting the environment. If trade has to be linked with environment then the WTO must also insist that the industrial nations demonstrate significant reductions in methane and carbon dioxide emissions. If they fail to comply then the WTO must impose penalties on them in the trade sector. Anything else would be utter hypocrisy and rightly expose the WTO to charges of bias and manipulation.

Let us reflect on the genesis of the environment-friendly technologies developed in the west which are now to set the standard for environment-friendly industrial production across the world. It was the profits generated from the industries producing on the basis on environment destroying technologies of 50, 100 years ago that enabled the development of technologies that are environmentally more benign.

It was the surplus money that came out of production processes that created the Greenhouse Effect and the Ozone Hole, that was used to develop alternatives for Ozone Destroying Substances and technologies to reduce release of Greenhouse gases. The developing countries must insist on transfer of these new technologies at highly concessional rates if any consensus is to be reached on establishing an industrial ethos that will be less detrimental to the environment.

Instead of a consensual approach what is emerging is a blatant manipulation of environment issues by the industrialised nations. The Montreal Protocol, weak to begin with, has become brazenly inequitable following the recent amendment that places restrictions on the transfer and mobility of new technologies relating to chlorofluorocarbons (CFCs). These latter are used in refrigeration and are thought to destroy the stratospheric ozone layer.

The Montreal Protocol as signed had agreed that developed nations would transfer ozone saving refrigeration technology to developing countries and ask for reductions in the use of CFCs to save the ozone layer. Now amendments to the original treaty say that the technology cannot be exported by the developing countries if they are being funded by developed countries. So, American technology available with Malaysia can be denied to India if the US so desires. This mechanism creates an instrument for turning the screws on a country and makes nonsense of the original purpose of the treaty.

In the context of a trade agenda, the question of impact on the environment is closely linked to the question of the fundamental inequity in the international trading regime. Many poor countries are dependent on commodity exports and sale of raw materials. Developing countries have genuine fear that they may be forced to limit their trade to commodities since environmental concerns will be used to justify unfair trade restrictions against them.

The inclusion and operation of apparent environment measures like the sanitary and phytosanitary clauses of the agricultural agreement in GATT is a case in point. Indian exports of cut flowers which were produced in collaboration with a Dutch company in an Indo Dutch joint venture were refused entry into the markets of Holland. The alleged reason was that the flowers were infested with pests and so failed to satisfy the phytosanitary requirements. The reality was that the European cut flower business was facing a glut due to domestic over production. Indian flowers were rejected on environmental grounds to protect European flower growers.

Developing countries face another structural problem with respect to the environment. Because of declining returns

from exports, growing external debt and the IMF imposed structural adjustment programmes, these countries are resorting more and more to desperate methods of production in which the environment is brutally assaulted The last fish are being fished and the last forests felled for timber and these countries are slipping into increasingly environmentally unsustainable or even environmental destroying modes of production

Forests are very obvious targets of 'green conditionalities Tropical forests are acknowledged to be important carbon sinks for the increasing emissions of carbon dioxide in the atmosphere If the area of tropical forests is reduced by those countries where they are located treating them as an easily exploitable resource, there will be serious global environmental problems The industrial north is very concerned about this but is unwilling to address fundamental problems like the inequity in international trade so that serious solutions to these problems can be found Since the problem of high carbon dioxide emissions is created by the industries of the north a sustainable and equitable solution can only be the transfer of technologies that will help to save the forest and a fairer share in global trade that will not force the people of developing countries to seek quick and easy money from the few resources they can still exploit

Developing countries have been faced with another aspect of the growing environmental concern in the west. This is the growing consumer resistance in these countries on environmental issues related to food. In Germany a growing movement against pesticide residues is beginning to function as a non-trade barrier against the import of Indian tea The German government is exploiting the prevailing sentiment fully since under its expanded aid programme it is committed to buying tea from non-traditional producers in Africa It is using the consumer resistance to cut down its tea imports from India

A famous example of environmental concern functioning as a non trade barrier is the case of the ban imposed by the US on tuna fish exports from Mexico Mexico's waters are rich in tuna fish and this constitutes a major portion of the country's exports particularly to the US and Japan Growing displeasure on the part of American tuna fishing companies led the US to resort to an environmental excuse to ban Mexican tuna import into the US The real reason was protecting American tuna fishers the reason given was environmental concern due to the destruction of dolphins during tuna fishing

The Americans suddenly claimed that the Mexican procedure for catching tuna fish also caught a number of dolphins This was unacceptable the Americans said since the dolphin was a protected animal Any number of defences offered by the Mexicans that they released the dolphin that were caught, back into the sea fell on deaf ears and the loss of revenue to Mexico and loss of livelihood to several thousand Mexican fishermen

And now a final word on the utter hypocrisy of concerns about the environment and the trade-environment linkage Despite the verbal hysteria on saving the environment and saving the planet, the rich in developed countries have consistently refused to take any cut backs in their opulent and wasteful lifestyles which place the bulk of the burden on the global environment

Japan is the largest consumer of tropical hard woods which are the most difficult timber to replace They are very slow growing and they come from rain forest over which there is such a hue and cry at every seminar on the environment The wastage of energy the production of consumer goods containing chemicals that destroy the environment these all happen in western countries which are screaming the loudest about environmental protection

A commitment to saving the environment will have to be seen in actions, not empty words It is only when the industrialised countries that are the principal polluters offer a genuine and equitable clean up package that any global agenda is likely to emerge on saving the planet Judging from recent reactions it appears that developing countries are determined not to play ball unless developed countries come forward in a spirit of co operation Till this happens, the environment will continue to take a beating

NATIONAL COUNCIL OF APPLIED ECONOMIC RESEARCH

"PARISILA BHAWAN", 11-INDRAPRASTHA ESTATE

NEW DELHI 110 002

NCAER has vacancy for a position at the level of Senior Economist with specialization in Water Management and how farmers can be involved in it The project would run for three years and the person would be acting as a Project Leader

The study relates to Institutional Reforms in Indian Surface Irrigation with special reference to Rajasthan and Maharashtra The study is a collaborative project with the International Food Policy Research Institute, Washington, D C (USA)

Employment terms could be flexible, Salary negotiable

ESSENTIAL QUALIFICATIONS

Ph D in Economics/Agricultural Economics from a reputed Indian or Foreign University, research experience in the field of Agricultural Economics/Water Management either in a University, Research Organisation or in Government departments dealing with economic problems, original papers and articles to credit Candidates should have capacity for conducting independent research and ability to write clearly and succinctly. A good knowledge in relation to Agriculture with specialization in water management would be desirable

AGE Preferably below 40 years

Other things remaining the same, candidates belonging to SC/ST and other backward and minority communities will be given a preference

Candidates will have to appear for interview at New Delhi and will be reimbursed first-class train fare by the shortest route to and fro from the place where they are presently working

Applications with full particulars of qualifications and experience, together with copies of published papers/reports, should reach the Registrar and Secretary of the Council at the above address by **14th August 1995**

KERALA

Panchayat Raj Act

Without Substance

K R Sastry

The Kerala Panchayat Raj Act negates the very concept of decentralisation by providing for interference from above

THE Kerala Panchayat Raj Act (KPRA), was passed by the state Legislature on May 22, 1994 as a sequel to the 73rd constitutional amendment, incorporating numerous amendments, but rejecting much of what was suggested by the members in the assembly In the process it deviated drastically from the original version of the bill that was introduced in the assembly on March 16 1994

The people of Kerala witnessed a series of acrimonious debates all round protest and even an unprecedented public dharna by intellectuals like K N Raj I S Gulati etc staged in front of the secretariat on some vital issues concerning the bill while the bill was being discussed in the assembly A former speaker and now a sitting member of the assembly well versed in various aspects of the bill had a 90 minute deposition before the 27 member select committee of the bill and explained how the bill was strategically tailored to concentrate power in the hands of government and officials under the pretext of decentralisation of power Social activists like V R Krishna Iyer, M P Narayanan Nambiar, and others, organised a People s Assembly (Janakiya Sabha) at about the same time to reflect the mood of the common man on Kerala Panchayat Raj Bill and to create public awareness on the government's move to include certain undesirable provisions in the act In spite of all the protests KPRA as passed by the legislature is an instrument aimed at maintaining centralised powers with the state government All the same, it can be said that the framework provided by the 73rd amendment was fully retained

Constitutional Provisions in KPRA

The KPRA broadly incorporates almost all the essential features envisaged by the Constitution It provides for a three tier system with the village block and district panchayats as institutions of local self-governance The formation of grama sabha – comprising all the voters in each constituency of grama panchayat (GP) – has been made the lowest rung in the ladder entrusted with the responsibility to supervise and accelerate local planning and development The grama sabha will have to meet twice a year at a venue decided by the GP, on being convened by the member of that panchayat constituency and the meeting would be presided over by the president/vice president of the GP The grama sabha is empowered to suggest plan or help developmental activities to discuss administrative affairs, to approve the accounts of the past year, etc, among other things The president of grama sabha will have to explain the reason for non compliance of any decision taken by it earlier The KPRA has delineated the role of grama sabha in clear cut terms

The act also provides for constitution of a ward committee comprised of members of GP and villagers for suggesting developmental activities of that village, besides encouraging public participation in local governance The rationale behind the creation of a smaller grama sabha comprising approximately 1 000 members belonging to each constituency rather than the whole grama panchayat is reflective of practical reasons to conduct the meeting conveniently and effectively considering the Kerala situation rightly The detailed provision regarding grama sabha contained in the act is a welcome step but the functioning of it will have to be carried forward further to make it a basic unit of grass roots level governance

The head of the panchayat is designed as the president and the executive officer the 'secretary irrespective of the tier to which he belongs The presidents at all levels are elected indirectly If the state legislature had exercised its discretion in favour of direct election from among the people in the case of a GP, it would have got a president deriving authority from the people rather than from the political parties although it may possibly lead to friction, in case where he belongs to a particular faction in the GP

The block panchayat (BP) at the intermediate level is a new democratic body in the scheme of PR in Kerala Most of the non-officials and officials at the panchayat and district levels opine that the BP is an undesirable tier thrust upon the people by the constitutional amendment This new tier can be entrusted more with the task of planning rather than planning That said, one cannot underestimate its importance in the planning phase for those schemes which are of trans-village in character It may be surmised that due to dense population, the geographical area coming under the district panchayat (DP) is not so vast, and, thus it could be easily managed without the middle tier It remains to be seen whether the new tier, i e, the BP can emerge as a fulcrum of activity and consequently dilute the importance of upper and lower tiers

The inclusion of MLAs and MPs in the BPs and DPs has not been received favourably since this may lead to over-centralisation in the democratic decision making process It is apprehended that such an incursion into PR theatre would be detrimental to the emergence of a vibrant local leadership The debate though inconclusive, over the nature and desirability of involvement of MPs in the local bodies takes a new turn with the allotment of rupees one crore for each MP to take up development activities in his constituency It may not cause any surprise if MLAs demand a similar largesse from the state In such an eventuality, the exclusion of these elected representatives is not a feasible proposition How this elite-elite conflict could be avoided is a moot question and the KPRA is more or less silent on this aspect Thus, one may get a feeling that the act is not a sincere exercise of decentralisation and at the most may be construed as a step toward 'deconcentration'

Similarly, presidents of all GPs and BPs have been included as ex officio members at the respective upper tier of the panchayat and this is intended for establishing an organic link between various levels The presidents, thus included in the upper tier panchayat have all rights of a member, including voting power except for electing/removing the office bearers

Administrative and Financial Centralisation

The KPRA ensures reservation in proportion of their population in the case of SCs/STs and one third for women at all levels Even in the reserved seats earmarked for SCs/STs, one-third are reserved for women In case, the population of SCs/STs is insufficient for reserving one seat, the act ensures that one seat is reserved to the category of SCs/STs, whichever is more in population in that given area Under the act, the state government, or an officer authorised by it, can exercise power to fix the number of reserved seats and determine the constituencies which are reserved for each category without resorting to any predetermined norm It is feared that this provision is liable to be misused for political gains

The act, in accordance with the stipulation of the 11th Schedule of the Constitution, provides powers and functions enlisted in Schedules III, IV and V to GP, BP and DP, respectively. There are 32 obligatory functions of GP, eight for BP and 21 for DP under the act. But the government can meddle with the elected bodies by formulating rules and procedures, in accordance with this act which allows it to formulate rules & procedures in about 140 instances. The act as well provides for the transfer of all grants pertaining to the mandatory items to the panchayats. The act also approves of transfer of all buildings, institutions etc. to the grama panchayats as soon as possible.

The act does not make any earnest effort for ensuring adequate financial resources to panchayat raj institutions (PRIs) to perform self-governing functions effectively. The devolution of resources other than the above mentioned grants pertaining to mandatory functions is conditioned by the words 'subject to availability' and this provision is liable to be misused to make PRIs run short of funds. In the present set up, the government can dilute the process of decentralisation of power by avoiding adequate devolution of financial resources and by not extending technical support to the PRIs.

The act provides for constitution of a three man State Finance Commission (SFC) with one member experienced in economics/financial matters and other two with experience in public/local administration. However the government soon after enacting the law, constituted the commission with all the three members coming from the bureaucratic stream. Similarly the act provides for having a State Election Commission (SEC) to conduct regular elections quinquennially. But the commission is not endowed with adequate autonomy and power to decide on all matters pertaining to elections without relying on the state government. The de limitation of wards, determination of reserved seats etc. are not entrusted to SEC and this raises doubt in the public on the intention of the state government. Even though the constitutional provision for creating an independent SEC notwithstanding the KPRA has made the SEC dependent on the state government for getting many things done before setting the election process on.

Further the act does not contain any clear provision that ensures the availability of existing technical manpower through re-deployment from the state government departments for carrying out and co ordinating developmental activities at the panchayat level. It would have been better if the power to pool the sectoral officers at each level by the PRIs had been incorporated in the act itself. This is a major task ahead for all panchayats to accomplish.

The act contains many provisions that allow the state government's interference in the form of inspection and supervision on the working of panchayats. This power, retained by the government, will pose a threat to the autonomy and freedom of the panchayats and the whole scheme of panchayati raj will deteriorate to a subordinate position *vis-a vis* the state. What is more, the provision for dissolution of panchayats by government on the ground of abuse of powers can be a perpetual threat. The authority of the state government to remove a member/president/vice-president/standing committee chairman and to debar them for misuse of power, dereliction of duties, etc. is liable to be misused for political gains particularly, because the terms 'misuse of power', 'dereliction of duty' etc. are not clearly defined in the act. The act empowers the government to exercise control, discipline, etc. on the staff including the secretary. The GP is empowered to have only nominal control on the staff and this can be construed as a tilt towards the officialdom in the scheme of local governance.

In order to enhance people's participation in local development, the act provides for constitution of ward committees, working committees and sub committees consisting of members of panchayat and citizens for speedier execution of developmental activities. These provisions can be used as an effective means to bring power to the people and for involving them in local affairs. The act provides for constitution of standing committees at all levels consisting of members of panchayat. It would have been better if the provision for inclusion of experts at times from outside is provided for in the formation of standing committees for discussing and dealing with specialised subjects in depth.

The KPRA does not uphold the cardinal principle that what can be done at a given level should be entrusted to that level itself and not to the higher level for distributing powers and functions at each level. While formulating the Kerala Panchayat Raj Bill it seems that no serious effort was made to delineate various functions that can effectively be performed at each level of panchayat in the context of Kerala. If true democratic decentralisation is the real goal it is imperative that the centralised powers so far held by central and state governments be decentralised from the centre down to the panchayats. For effective decentralisation three types of shifts in power become imperative in the panchayat raj context – viz. vertical, horizontal and diagonal. The 'vertical' implies power shift from the central to the state, from the state to the district level and from the district level further downward, the 'horizontal' connotes a shift in power from appointed (officials) to elected people (non-officials); whereas, the 'diagonal' implies power shift from the MLAs and MPs to the panchayati raj functionaries. Unless such power shifts are effected, creation of a decentralised polity remains a utopia.

The act allows the state government to interfere in the working of the panchayats by invalidating the action or resolution passed by the panchayat or any of its committees. Thus, it negates the very concept of decentralisation by interference from above.

In short, the purpose of the ruling UDF government in enacting the KPRA is more to meet the constitutional requirement rather than to implement panchayat raj in letter and spirit. If one takes a dispassionate look at the legislative process behind the enactment of KPRA and the follow up action so far taken by the state government, it would be clear that it does not like to have a meaningful decentralised system of governance in the state.

The 73rd constitutional amendment contains many discretionary provisions allowing the state government to enact a meaningful panchayat raj legislation that brings power to the people. However the Kerala state government seemed more interested in extending the bureaucratic control over the elected panchayat raj bodies. But in the final analysis it was forced to compromise on many provisions in the bill due to the ever vigilant public protest and have enacted the law which can be better described as a caricature of Gandhian idea of grama swaraj or Rajiv Gandhi's dream of delegation of powers to the grass roots. The KPRA should have taken care to incorporate the wisdom of various committees, reviews and evaluation studies on panchayat raj whose main thrust has consistently been how to make the grass roots institutions more effective.

It can however be considered a blessing that we have a panchayat raj act in Kerala at last having constitutional buttress to start with. Basing on the recent pronouncements the elections to PRIs may be delayed till April 1995. This is due to the fact that the 73rd Constitutional Amendment was silent on the minimum period by which state governments should conduct elections after giving statutory recognition to PRIs. It must be added that the KPRA appears to be skeleton legislation as it bestows maximum discretion and initiative in the hands of the state government through subordinate legislation. It is left to the politically articulate elite groups in Kerala to carry forward the idea of democratic decentralisation by invoking the positive provisions to strengthen PRIs and thereby discouraging the centralising forces which have a debilitating effect on the growth and development of the panchayat raj.

India and South-East Asia

Search for a Role

M G G Pillai

If India wants a role in south east Asia – in economics trade and politics – she must immerse herself in it Her worries about China are understandable, but ASEAN and south-east Asia would not warm up to her if that is her only focus If Narasimha Rao's visit to Malaysia is a precursor to a change of attitudes, then there is still hope

INDIA S post independence view of south e ist Asia within a prism of the cold war and her political and territorial confront itions with China and Pakistan now come to haunt her Her initial view of the Association of South E ist Asian N itions (ASE AN) as a probable we stern Troj in horse did not help When she did focus her attention at the region after the Vietnam war it was as a sideshow to China s perceived threat So when her economic reforms and politic il develop ments demanded a link few in ASE AN supported her bid Th it is New Delhi s dilemma as the prime minister P V N ir simh a R ao prepares to visit M alays i in Aug ust

The Indi in cultural heritage so impressed in ASE AN should have provided the bridge but w is not built upon This is often not admitted but is centr il to understanding the region only Sing apore the Philippines and soon Vietnam have different norms But south e ist Asia also came within China s sphere of influence Her emissaries and diplom its had involved themselves in the affair of the region since the 14th century perhaps earlier Western colonial policy in the 20th century had had to accommod ate Chin s point of view as Brit in did in Hong Kong China after 1949 intruded into the post war independent countries first as the linchpin of the communist insurgency that afflicted every one of them and now as a power intent on re establishing her influence

The Bandung Conference in 1955 soured India s relationship with south east Asia The Chinese prime minister Zhou Enlai s masterful performance there left Indi s Jawaharlal Nehru fuming The 1962 Sino Indian war affirmed it, with only Malaysia openly supportive of New Delhi Post world war alignments, and the cold war placed India squarely with the Soviet Union and south east Asia apart from Indonesia in the western camp Apprehensions of a regional tilt towards Pakistan immured relations further

Besides, India prefers bilateral ties with a region culturally conditioned to consensus and co operation Neither Indian prime minister nor foreign minister has called on all their ASEAN colleagues though they have come on bilateral visits ASEAN, when formed in Bangkok in 1967, wanted India s friendship and first expressions of support The portentous almost superc ilious Indian response received after much prodding set the tone of what followed When M alaysia twice in 1975 and 1980 – invited New Delhi as a full dialogue partner she was disinterested now she wants in and ASE AN more formalised is uninterested

New Delhi s sectoral dialogue with ASE AN puts her in a straitjacket Her point of reference is the secretary general She takes no p irt in the nnual post conference dialogues A s ctor il dialogue once a prelude to full dialogue is not any more South Kore a m ached to full dialogue after a stint in sectoral dialogue ASE AN prefers dialogue with the S uth Asian Association for R egional Coop r tion (SAARC) India as Pakistan for s milar reasons would not for fear that her r l tion with ASE AN would diminish

Malaysia still w nts India in a prominent role in south east Asi e though less so now After the Sino Indian war Malaysia requested unsuccessfully for India s neutra lity in her territori l dh pute (confrontation) with Indones i the following ye r In 1965 Mal aysia backed India in her war with Pakist n and Islam b d broke off diplomatic relations in ret li tion New Delhi rejected Malaysia s reques for small arms in 1969 aft r her racial riots In 1980 she requested Indi to delay recogn sing the Heng S amrin government in C mbodia until after the dialogue Indi went ahead and Rao then foreign minister st yed away

The die is cast When the Soviet Union gave up the ghost and broke up in 1989 India counted for little in regional affairs Malaysia in 1991 attempted once again but India rebuffed her over the then East Asian Economic Group, now a Caucus EAEC involves China, Japan North and South Korea and ASE AN, on the principle that countries engaged in economic activities and political co operation are less likely to go to war with each other, and to provide a forum for a common position before meetings of the Asia Pacific Economic Co operation (APEC) and, possibly other bodies India in it would have been a weighty counterpoise to China, which even Japan could not provide

ASEAN disinterest in India appears complete, her potentially huge markets an insufficient lure India wanted Singapore to sponsor her into the APEC, the Indian deputy foreign minister Salman Khursheed, now appeals to Australia to accept her brief But Vietnam as the new ASEAN member would be next followed by Russia and the Pacific South American countries A five-year delay of India s chances is overly optimistic, but the momentum would be lost by then Why she had not lobbied ASEAN during the sectoral dialogue or with individual ASEAN members is unclear Or did she and was rebuffed?

Unfortunately miscues and mistrust by both complicate the problem Besides, ASEAN s arrogance rising in tandem with economic success matches India s The tendency to look at India in the same light ASEAN looks at its Indian population almost all of whom are labourers or in the lower segment of society does not help But ASEAN and India also need each other A denouement is inevitable, India and ASEAN must look beyond short term policy considerations or market factors

The post independence generation in ASEAN and India with their differing priorities to the present are poised to leadership and that could change perceptions Countries and organisations re generate every generation for effectiveness neither Sri Lanka nor the United Nations did, and face life threatening choices But if India wants a role in the region – in economics, trade politics – she must immerse herself in it Her worries of China are understandable, but ASE AN and south east Asia would not warm up to her if that is her only *raison d etre* If Rao s visit is a precursor to redress the balance and doubts and change attitudes, then there is still hope

Otherwise when Asia Pacific trade takes off with or without APEC New Delhi could be left on the shelf Her attempts at an Indian Ocean APEC with South Africa and Australia run into flak she eschews SAARC in the equation as Australia her South Pacific Forum members If the worldwide scramble for markets succeed the winners could well be regional trading blocks ASEAN then could not possibly ignore India but India could find herself left out of that new equation

MARXIST THEORY AND NATIONALIST POLITICS
The Case of Colonial India
Sanjay Seth

The author shows how those committed to socialism, as conceived and imagined through Marxism came to regard nationalism as the essential feature of the non-Western world. He goes on to reveal the profound consequences of this encounter for Marxist-inspired political movements in colonial India and in other countries.

CRISIS AND CHANGE IN CONTEMPORARY INDIA
Edited by Upendra Baxi and Bhikhu Parekh

Bringing together internationally distinguished observers of India--who express a variety of viewpoints, cover a fascinating range of themes, and raise issues of both academic and practical importance--this book will be of considerable interest to students of politics, sociology, history, psychology, health, environment, development and South Asian studies. It will be indispensable for anyone concerned about contemporary India.

STATE AND CIVIL SOCIETY
Explorations in Political Theory
Neera Chandhoke

Through an extensive reading and interpretation of the literature in political theory, this thought-provoking book constructs an entirely fresh theory of civil society that can be used to promote democratic participation and responsibility. A path-breaking study, it differs from purely theoretical exercises by addressing itself to praxis-oriented politics.

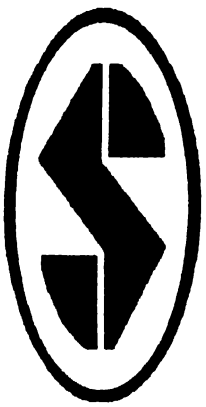
THE INDIAN ECONOMY, 1947-92
Vol 1: Agriculture
V M Dandekar



Prof. Dandekar addresses several issues including the disproportionately large burden of population that agriculture has to bear; the over-centralised nature of agricultural administration, research and education and the effect of the acute food shortages of the war and post-war years on food administration. Finally, he draws together these themes to formulate a future agricultural policy.

THE INDIAN ECONOMY, 1947-92
Vol 2: Population, Poverty and Employment
V M Dandekar

In this volume, Prof. Dandekar brings together his writings on three closely linked subjects--population, poverty and employment. Reviewing India's progress in health and education, he provides a detailed analysis of the government's efforts to alleviate poverty. Finally, he discusses among other issues Gandhi's views on the subject, the Khadi programme, and the measurement of underemployment and unemployment.

Rise and Fall of US Imperialism

Chronis Polychroniou

The article focuses on the role of the US imperial state in the process of worldwide capitalist development and capital accumulation and its efforts to establish global hegemony. It argues that US imperialism has reached a critical stage in its evolution: the over-extension of the empire is causing the downfall of the domestic economy and society. Domestic economic reconstruction has been sacrificed for global corporate and financial expansion as the interests of the capitalist ruling class lie in foreign investments and global markets.

THE cold war is over but the neoliberal global order spearheaded by the US since the late 1980s is already crumbling under the weight of its own contradictions. Instead of democracy, freedom and security, as the empire builders promised, the new wave of globalisation has unleashed the political forces of authoritarianism and oligarchy, ethnic hatred and civil war and has ignited a new spark of military rearmament. The neoliberal theology – let the market have its way [*The Economist* June 29, 1991] – has not produced 'economic miracles' but, on the contrary, worldwide declining living standards, massive unemployment, environmental despoliation, suffering and polarisation. Indeed, an 'Empire of Chaos'[1] is an apt characterisation of the post cold war world order.

Unlike the New World Order established in 1945, the post cold war world order lacks hegemony to sustain the economic, political, and social arrangements that constitute the 'new imperialist order'. In spite of the wishes of American policy-makers to erect a new Pax Americana in light of the opportunity presented to them by the elimination of the former socialist bloc, the fact of the matter is that the US is in an irreversible course of decline and, unlike in 1945, no longer capable of reinforcing the nexus of international relationships upon which the newly created neoliberal global order depends. The dialectics of America's status and its position in the world today is that while the US can intervene abroad without having to worry about a Soviet response, its economic power has eroded to the point that military interventions depend increasingly upon the willingness of its allies/competitors (Germany and Japan in particular) to support such operations, both politically and economically.

The US economy has been in a state of deep, structural crisis for over two decades now and its problems are mounting: plant closings, industrial decay, astronomical deficits, stagnated incomes, crumbling infrastructure, decaying cities, moribund banking, disintegrated education, health care, and social security threaten to reduce the US economy to a third world status while crime, drugs, economic alienation and racism are tearing the social fabric apart and thereby presenting the US ruling class with greater opportunities to extend the police operations of the US imperial state to the domestic realm as well – as increasing the size of the police force and building more prisons are the only remedies the capitalist class is capable of prescribing to the structural crisis of the US economy. Since the 1960s the US has been falling behind its major competitors in rate of growth in every single significant category in economic life" [Laxer 1989: 9].[2] With some $ 3 trillion in total government debt, the US is the largest debtor nation in the world. Calculations based on the Luxembourg Income Study reveal that "the US has the highest poverty level and most unequal distribution of income in the Northern Hemisphere" [Solomon 1994: 16]. As recently as 1992, the top fifth of American families got 51.3 per cent of US income versus 6.5 per cent for the bottom fifth [*Business Week*, August 15, 1994]. Over 34 million Americans live below the poverty line [Cuomo Commission 1992: 150]. Some 35 million people have no health insurance at all [Health Insurance Association 1990: 13]. Among the leading western industrialised countries, the US has the highest rate of poverty for children [Arnott 1994: 166] and ranks 20th in infant mortality rates [Shuman 1994: 1]. The US also has the highest rate of incarceration in the entire world.

The only clear superiority the US maintains is in the area of military weapons and technology, which in the post cold war era has indeed become the cornerstone of the nation's foreign policy. It is upon the basis of the US military superiority that a collective will has been temporarily formed among the major capitalist powers, as evidenced by the way the US was able to gain support for its barbaric and cowardly war against Iraq.[3] Nevertheless, military predominance alone is hardly sufficient to provide stable, long-term hegemony within the ranks of the imperialist powers. Economic and political interests will gradually create cleavages and tensions and conflicts will erupt, as they already have, for example, in the area of the US-Japanese trade relations.

It is a conceptual error to believe that globalisation has made obsolete distinct blocs of capital and the nation-state.[4] One of the main paradoxes of the new wave of globalisation, which is certainly real, is that the world economy is splitting into regional economic blocs headed by the dominant state in the region – Germany in Europe, Japan in the Pacific, and the US in the Americas. Globalism and regionalism operate simultaneously in today's world economy, a phenomenon which is part of the process of the dialectical contradiction of a leaderless world capitalist system. In today's world economy, hegemony is to be found not at the global but rather at the regional level. Thus, the world imperialist system is fraught with contradictions at all levels: contradictions between members of a bloc, between the different blocs, and between the blocs and other countries.

Essentially the newly created neoliberal global order reflects the end of the transition from superimperialism (which was based on US supremacy in the world economy from 1945 to 1973) to the renewal of interimperial rivalries. The resurgence of interimperial rivalries and conflicts has become once again the essential means through which capital reorganises itself and creates in turn the objective basis for the fundamental contradictions and crises in the unfolding of imperialist accumulation. The process of the internationalisation of capital and connected with this, the decline of the US has given rise to new centres of accumulation within the imperialist chain and in an extended manner to new imperial powers. In the absence of a single hegemonic power, the operations of the neoliberal global economy are prone to intensified crises and greater instability.[5] In this context, the objective and analytical primacy of the decline of the American empire is essential and must inform Marxist analysis of the developing international situation. It is also necessary for the politics of radical social change in the US as well as abroad.

Let us be very clear about it. Given the current world economic and political situation, the declining position of the US is fraught with both dangers and opportunities. The empire will not go down without a fight. If history is of any true guidance, empires become more bellicose when they reach that crucial stage in their evolution where power is beginning to slip away from their control. To be sure, trends toward greater militarism abroad and the rise of authoritarianism at home have already appeared loud and clear on the US imperialist

camp since the early 1980s And no-one should be deceived by now by the presence of a democrat president in the White House It is plainly clear that the policies of the Clinton administration are in many essential regards even more conservative than those of the Reagan and Bush administrations [Petras and Vieux 1994 25 30] Whether it is in foreign policy (NAFTA Cuba, Bosnia), or on domestic issues (welfare, crime), Clinton is catering to the needs and demands of his business supporters and is obediently staying the course in promoting the interests of a global empire at the expense of domestic reconstruction However there are also real opportunities opening up now with the decline of the American empire for structural reforms of the economy As immiseration and polarisation continue to rise in the US popular struggles for social change especially amongst the huge reservoir of economically politically socially racially and culturally oppressed groups of people in large inner cities may reappear on the stage with dramatic effects In this context the organisation and mobilisation of working class people along the lines of an independent class based democratic movement must become the explicit goal of the American Left Efforts for change from within the establishment of the Democratic party are doomed efforts and a sure way in fact of keeping the system functioning like business as usual Saul Landau has it right when he says that the Democratic party is not really a party but a money laundering operation [Booth 1994 262] Either way however

what is absolutely certain is that whether the pendulum in this country swings either toward greater authoritarianism and anti working class politics or substantial democratic reforms depends ultimately on popular expectations and responses

Below we look at the political economy of US imperialism from its origins to the present Attention is focused on the role of the US imperial state in the process of worldwide capitalist development and capital accumulation and its efforts to establish global hegemony From a Marxist standpoint of view, the rise and the decline of the American empire can only be understood within the context of the dynamic and contradictory processes of capital accumulation, interimperialist rivalries, and class antagonisms The contention here is that US imperialism has reached a critical stage in its evolution the over-extension of the empire is causing the downfall of the domestic economy and society Domestic economic reconstruction has been sacrificed for global corporate and financial expansion as the interests of the capitalist ruling class today lie in foreign investments and global markets

The article is divided into three sections Section one looks at the rise of US imperialism and the emergence of the US as a major world power from the 1890s up to the period leading to the second world war Section two highlights the phase of US global hegemony from 1945 up to the early 1970s Section three ponders on the crisis of US imperialism and the decline of the American empire from 1973 to the present Finally, in the conclusion we raise questions about the future of US imperialism and the consequences of the continued diversion of domestic resources to projecting power in the post cold war era

I
Rise of US Imperialism

America has a long history of the use of force oppression and outright terror From the Indian massacres by the early colonists to the gruesome slaughtering of over 2 50 000 Iraqis during the 1991 Gulf war and to the insidious policy of embargo on Cuba American power has functioned as an instrument of imperial rule and subjugation and violence has been the norm rather than the exception The reasons are deeply rooted in the American culture American consciousness has been shaped by the principles of Protestant denominationalism [Augelli and Murphy 1988] in which religion, politics, and racism intermingled to define America's role in the world and ultimately justify expansion conquest, and enslavement Indeed from its origins America and American expansionism marched to the tunes of fundamentalist overtures – exceptionalism racial superiority, divine mission' and the like A crusading spirit to extinguish, govern or control 'savage' senile' and barbarous' people runs like a red thread throughout American foreign policy and diplomacy – from Washington's belief in the extinction of the Indian right of occupancy, by whatever means necessary, to the acquisition of California by conquest from Mexico in 1848 and from the military interventions and occupations in the Caribbean during the late 1890s, and early 1900s to Ronald Reagan's 'evil empire' mentality and George Bush's Saddam Hussein 'syndrome

No less influential factor in the conditioning of the American political culture has been 'possessive individualism' – a philosophy of radical individualism that glorifies private property, competition, and self-aggrandisement and regards 'might is right' as something natural Throughout the 19th century the build up of colossal fortunes by few was defended as actions reinforcing both the laws of nature and of God Thus, as John D Rockefeller declared, "The growth of a large business is merely a survival of the fittest The American beauty rose can be produced in the splendour and fragrance which brings cheers to its beholder only by sacrificing the early buds which grow up around it This is not an evil tendency in business It is merely the working-out of a law of nature and a law of God" [Farhang 1981 91] These sentiments also apply to the business of imperial policies The orgy of US imperial conquest during the late 19th century was routinely defended on claims that spoke of the dynamism of the Anglo-Saxon race leading inevitably to territorial expansion" [Farhang 1981 80] The expansion of the American empire was the natural order' of things and God was always on America's side

However, while cultural factors played a significant role in America's quest toward imperial growth and expansion the rise of the US into an imperialist power and history's most powerful and destructive empire was due to specific economic and social developments at a particular stage in the development of capitalism as a social system

the monopoly and imperialist stage

During the last two decades of the 19th century innovations in science and technology led to substantial changes in the productive forces of capitalism High-speed machinery and new sources of power created large size productive processes in all segments of the economy (manufacturing, agriculture energy, transportation, steel and petroleum) and hastened the concentration and centralisation of capital through the expropriation of smaller capitalists by larger ones Giant corporations emerged that begun to dominate economic life on a national scale and to increasingly intrude into the economic environment of other countries [Bunting 1986] The free market was displaced by capitalist monopoly Cartels, syndicates and trusts, intertwined with banks determined now the structure of the economy

With the transition of capitalism to the monopoly stage, capital export attained increased importance International investments, which played a very minor role in international affairs during the early part of the 19th century [Kenwood and Lougheed 1992 36], begun to characterise more and more international economic relations The scramble for colonies also intensified during this period as the major capitalist power were desperate for raw materials, new markets, and spheres of capital investment Whole continents – Africa, Asia, as well as Latin America – were annexed and subjected to either colonial or semicolonial rule [Stavrianos 1981 281] As L S Stavrianos writes, "whereas an average of 83,000 square miles of colonial lands had been acquired each year between 1800 and 1875, the figure jumped to 2,40,000 square miles for the period between 1875 and 1914" [Stavrianos 1981 263-64] Wars among the major imperialist countries defined the politics of imperialism during its early period

The US arrived on the imperialist stage with the war against Spain in 1898, after having already demonstrated its willingness to play the role of a world power in the crisis that erupted over the boundary line separating Venezuela and British Guiana in 1895. By that time the US had already become the leading industrial power in the world and concentration (first through the trust movement between 1879 and 1890 and then through the consolidation movement between 1897 and 1903) had reached great heights [Link 1967: 48]. Giant corporations like Standard Oil (controlling over 85 per cent of the refinement and production of crude and illuminating oil respectively) and the American Sugar Company had been formed and cartels already represented a central component of capitalist economic life. By the turn of the century the top 4 per cent of corporations 'produced 57 per cent of the total industrial output by value' [Weinstein 1981: 63]. Concentration of banking also experienced the same process with finance capital becoming the dominant bloc of capital having combined their resources. J P Morgan and Company, the First National Bank and the National City Bank was represented by 341 directors in 112 corporations having aggregate resources exceeding $ 22 000 000 000 [Barck Jr and Blake 1947: 45]. In the light of the new developments in the basic operating framework of the U S economy imperialist expansion became a necessity for the very survival of the system of monopoly capitalism. The US monopoly capitalist economy was threatened by its own industrial growth. New markets had to be sought to buy the goods and products of the American economy, new areas to be found for raw materials to sustain the growth of industry and new sites for investment. The same violent, self assertive attitudes that the colonists had expressed some 200 years ago resurfaced now and with even greater clarity. Calls for war were heard everywhere as capitalists sensed that war is prosperity [Schirmer 1972: 45]. The ruling class began to mobilise the state and its apparatuses in leading the way to war, the goal of which was economic expansion and enlarging the US empire although humanitarian concerns over the treatment of Cubans by the Spaniards were cited quite naturally, as the reason for going to war. The interests of corporate and finance capital were thoroughly and permanently incorporated into US policy. And so monopoly capitalism was converted into state monopoly capitalism. By the same token, the state became an imperial state. That is, its activities were no longer confined to the domestic arena but extended to the international system as well. In this context military force became the chief means through which the imperial state promoted and secured the process of capital accumulation on a world scale. But this should not be surprising. As Michael Parenti has put it, empires "are built upon the sword, the whip, and the gun' [Parenti 1989: 38].

Unlike earlier expansion, imperialism is no longer an attitude or question of desire and choice. The system of monopoly capitalism requires an imperialist course in its quest for greater profits. Thus imperialism is not a policy but a system driven by economic necessity and it underlines the monopolisation of capitalist economic life and the internationalisation of capital.

With the defeat of Spain, the US gained control of the Caribbean dominion and rapidly spread into the Western Pacific and the Far East with the proclamation of the open door policy in 1899 – the first imperialist announcement of the intentions of the US to wrestle power away from Japan and the Europeans in the Pacific and to have access to China's trade. The march of the US toward becoming a world empire had begun. Indeed between 1900 and its entry into first world war in 1917 the US secured an interoceanic canal with territories and bases stretching throughout the Caribbean and the Pacific. In the years 1899-1990 Puerto Rico was converted into a colony, Cuba into a protectorate, the Philippines were annexed after first U S troops brutally suppressed the national liberation movement of Emilio Aguinaldo by killing over 20 000 Filipinos and Hawaii, Guam and Samoa were occupied. In 1903 the US established a protectorate over Panama and realised its long interest in a canal by securing the Panama Canal Zone and between 1898-1917 it made a series of military interventions in Cuba, Haiti, Nicaragua and the Dominican Republic. Indeed with a free hand in the Caribbean the US imposed military dictatorships throughout the region and monopolised the various economies thus setting a pattern of imperialist influence and control that has continued right down to this day [Fernandez 1994].

The foreign economic activities of the US during the period between 1900 and first world war also increased geometrically to the expansion of the empire. US foreign investments grew from $ 500 million in 1900 to $ 2 5 billion in 1914 [Woodruff 1982: 150-51]. In the Caribbean area alone US investments rose by $ 400 million between 1900 to 1902 and by 1912 they reached $ 1 5 billion [Gardner 1976: 52-53]. As might be expected, there was also a dramatic increase in US foreign trade. Between 1890 and 1914 American exports witnessed a three-fold increase, with 63 per cent of the manufactured goods going to Europe while imports increased more than two-fold [Barck Jr and Blake 1947: 10]. Here it is interesting to note that the flow of the US goods and products in Europe at the turn of the century was indeed so st and overwhelming that the phrase 'the Americanisation of the world' was coined to alert European leaders to the dangerous ramifications of the economic dominance of the US [Kennedy 1992: 245].

Yet, the economic prosperity that the American empire was enjoying during this period did not translate into gains for the majority of the American working class people. Unemployment had dropped from 18 per cent in 1894 to less than 4 per cent in 1902 [Dubofl 1989: 71]. Nevertheless poverty was quite widespread with as much as half of the industrial workers living below the line of poverty while working conditions were so hazardous that surveys conducted in 1907 and 1913 found that thousands of American workers annually were killed on the job and more than half a million were either crippled or seriously injured [Link et al 1987: 10]. The big winners were the industrialists and the bankers. The workers created all the wealth but the capitalists reaped all the benefits. And the state in fusion with big business made sure that this remained the case. The famous Sherman Act of 1890 for example from an alleged piece of legislation designed to be used against illegal monopoly formations became in the 1900s an era of growing radicalism in the US a weapon that the government used to smash workers' strikes and boycotts [Link et al 1987].

First world war was a major blessing for the US in its march toward a global empire. First it provided a tremendous boost to the US economy as America became the main supplier of food, military weapons, and raw materials to the Allies. Between 1914 and 1916 American trade with the Allies grew from $ 825 million to an astonishing $ 3 2 billion [Link 1987: 119]. Second, the war caused a dramatic shift in the balance of the imperialist forces. The contradictions of inter imperialist rivalries on the European continent (exasperated by the emergence of powerful Germany eager to challenge the imperialist status quo) that led to the first imperialist world war left in the end the old European power system in ruins and saw in turn the rise of new imperial powers in the world, Japan and the US [Kennedy 1992: 327]. But the US emerged from the war as by far the most powerful nation. Indeed, the changes in America's international position were profound. Up to the period leading to first world war the US had been a capital-importing nation. By the end of the war however, the US "became the world's greatest financial and creditor nation in addition to its already being the largest producer of manufactures and foodstuffs' and "had by far the largest stock of gold' [Kennedy 1992: 327]. While in 1914 foreign assets in the US exceeded by over 50 per cent private American assets abroad, by 1919 the situation

had been practically reversed [Williamson 1951:543]. After the end of first world war both the British and the French owed several billions of dollars each to the US and, more important, saw their international investment position decline rapidly in the coming years *vis-a-vis* that of the US. US foreign investment grew from a mere 6.3 per cent in 1914 to over 35 per cent in 1930, while foreign investment for Germany, France, and Britain experienced a marked decline [Lotta and Shannon 1984: 192]. Furthermore, by the early 1930s the pound-sterling was no longer serving as the key standard for the international monetary system and was replaced instead by gold – a shift which, as Charles Kindleberger has pointed out, reflected the changed status of the US in the international economy from a debtor to the European powers before the war to a creditor nation [Kindleberger 1966:207].

There can be no doubting that the US had become after the end of first world war the leading economic force in the world capitalist economy. What is often ignored or downplayed, however, is the political position the US gained in the postwar era. At the Versailles conference, Woodrow Wilson clearly dictated the terms of peace, and even though Britain, France, Belgium, and Holland did not agree with his insistence on a system of collective security rather than the traditional balance of power, America was permanently entangled in world affairs[9] – as the decision to intervene in Russia in 1919 in hope of overthrowing the Bolshevik leadership, the signing of the Washington Treaties in 1922, and the renewed intervention in Latin America in the 1920s clearly demonstrate.

Yet, while globally the US gained tremendous ground both economically and politically as a result of first world war, on the domestic front the scenario for the working class hardly changed at all. The capitalist class continued, in fact intensified, its assault against labour. The years following first world war were by far the more radical in the history of the American labour movement. Unionisation reached an all-time high, the socialist parties had hundreds of thousands of members and supporters, and socialist administrations were in power in several areas, including Berkeley, California, and Milwaukee, Wisconsin [Link et al 1987:13-18]. Over 2,660 strikes were reported in 1919, involving millions of workers from one end of the country to the other who were unwilling to accept capital's assault on their income wages [Link et al 1987:154]. That same year the country was also rocked by the 'Red Summer'[10] events – the race riots that first erupted in July in Chicago and then spread into over 25 other cities – as blacks were resisting the economic and racist assault of white capitalist America. Between 1919 and 1920, the first 'Red Scare' took place and the state engaged in an all massive effort to smash the radicalism of the American working class by arresting and deporting many thousands of labour union and socialist activists as well as organising violent attacks on strikers throughout the country [Link et al 1987: 156-58]. The working class was standing on the way of the fortune amassment of corporate and finance capital and, simply put, had to be crashed and brought to its feet.

US monopoly capitalism continued to prosper throughout the 1920s as new industrial management methods and technology were introduced that raised production to new levels. The production of automobiles experienced 255 per cent increase from 1919 to 1929, and chemical products, rubber, iron, and steel increased by an average of more than 83 per cent [Link et al 1987:168]. Accordingly, from 1923 to 1929, profits and dividends of US corporations got a boost of 62 and 65 per cent increase respectively [Link et al 1987:168]. Yet, all was not well on the US capitalist front. Agriculture entered a depression as early as the summer of 1920, a monetary recession occurred in 1921, and several thousands of banks were closed [Link et al 1987:178]. There was also a new wave of consolidation that monopolised wealth even further; thus, by 1930, the top 5 per cent of corporations were receiving 85 per cent of the entire corporation income [Link et al 1987:176]. Indeed, all throughout the 1920s, while the rich were getting richer, the overwhelming majority of Americans lived in dismal conditions. Some historians have estimated that approximately 71 per cent of American families were earning wages that were below the line of a 'decent living standard' [Link et al 1987:168].

The collapse of the stock market in October 1929, though it took capitalists by surprise, was actually forthcoming. According to Kindleberger, "business was in trouble before the crash... March was ... the peak of automobile production, which fell from 6,22,000 in that month to 416,000 in September, at the height of the stock market. The industrial production index fell after June, and the decline in industrial production, prices and personal income from August to October was at annual rates of 20, 7½ and 5 per cent" [Kindleberger 1973:117]. The agricultural sector, still quite significant in its impact on the US economy, had been in a state of depression since 1920 and "farm incomes ceased to rise after 1925..." [Kenwood and Lougheed 1992:224]. Residential and non-residential construction had been in a state of slump since the early 1920s and begun to decline after 1925 as well [Kenwood and Lugheed 1992:224]. Throughout the 1920s income inequality was growing at a tremendously rapid pace. Between 1920 and 1929 the top 5 per cent of the population increased its share of the national income from 24 to 34 per cent [Duboff 1989:87]. The failure of thousands of banks before the crash pointed to the severe weakness of the American banking and financial system. But the ruling class is always the last to grasp the contradictions of the anarchic profit-driven system of capitalism.

In view of all the above, and given the dominant role of the US in the international economy, the causes for the Great Depression of the 1930s that followed immediately after the Wall Street collapse had, in all likelihood, much more to do with the state of the US economy than the nature of the international economy. The Depression nearly forced capitalists to close shop for good as the contradictions of production and consumption in the capitalist system exploded at once and with the biggest bang in the economic history of capitalism. Industrial production fell by over 50 per cent in 1932; salaries decreased by 40 per cent; manufacturing wages declined by 60 per cent, over 2,000 banks closed involving several billion dollars, and one-fourth of the labour force was unemployed [Link et al 1987:228-30]. Between 1929 and 1933 there was a 54 per cent drop in the total national income [Chandler 1970.25]. Gross private domestic investment declined by 89 per cent [Chandler 1970:20]. During the period between 1930 and 1941 "actual GNP was nearly 25 per cent below the economy's potential [Chandler 1970:4]. Farmers suffered the most extensive damage due to the Depression as gross farm income dropped from $ 11.9 billion in 1929 to $ 5.3 billion in 1933 [Chandler 1970.229]. International trade and commerce also collapsed and political upheavals throughout Latin America in the 1930s threatened US hegemony in the region. Furthermore, the policies of the New Deal implemented by Roosevelt in 1934 (the National Recovery Act and the Agricultural Adjustment Act in particular), provided very little substantive relief to the economic suffering of the American masses at the time and the economy did not begin to show any signs of recovery until 1939, when the GNP regained its 1929 levels [Duboff 1989:91]. Unemployment, which peaked over 24 per cent between 1932 and 1933 [Chandler 1970:5], never fell below 19 per cent before late 1940 [Chandler 1970:91]. Thus, as at least one American historian has written, the New Deal "never demonstrated that it could achieve prosperity in peacetime" [Leuchtenburg 1963:346].

What brought the US economy out of the Depression, and what in essence saved capitalism, was the second imperialist world war. The mobilisation of the economy through military spending provided the impetus to economic growth and expansion which otherwise was missing from the

structures and mechanisms either of free market or welfare capitalism Indeed as Richard Barnet put it second world war turned out to be the greatest single American success of the century Beyond the much needed economic stimulation it provided, the war fulfilled an important psychological need by giving a common purpose to what in 1940 was still a country threatened with serious economic unrest [Barnet 1973 45 46]

II
Era of Global Hegemony

Two global wars in the 20th century have been terribly beneficial to the US While first world war turned the US into a major power in world affairs second world war elevated the US to an absolute dominance of the world capitalist order Only the US emerged from the second world war stronger than it went into the war It was the only capitalist imperialist power with the ability to reconstruct and maintain world capitalism The European imperialist powers including Japan had suffered enormous destruction and their economies lay in ruins The situation in the Soviet Union as the systemic adversary to international imperialism did not fare any better In fact the Soviet Union had borne the major cost of the war with some 30 million dead scores of large cities levelled and thousands of towns and villages smashed A US intelligence report in 1945 surveyed the military capacity of the Soviet Union and concluded that its deficiencies were so severe that it would not be able to fight another major war for at least 15 years [Fleteher 1985 27 28] George Kennan in his long telegram in 1946 also reported that gauged against the western world as a whole Soviets are still by far the weaker force [Paterson 1984 297] Yet such reports did not stop the US from designing and implementing a grand strategy of power projection in the name of Soviet containment The alleged Soviet threat provided the pretext for the outburst of US imperialist aggression and domination in the post war era which was responsible for almost 50 years of hot and cold wars the death of millions of people and eventually culminated in the supremacy of western capitalism and the overthrow of socialism

The reason the US emerged from the war as the dominant global power was aptly summarised by Gabriel Kolko 'no major power sacrificed less of its blood and material wealth during second world war than the US [Kolko 1968 618] War time production and a new long wave of technological innovation had pulled the US economy out of the depression to become the world's industrial giant by the end of the war During the war years the US GNP grew by over 50 per cent, while that "of Europe as a whole had fallen by about 25 per cent [Kennedy 1992 368]. From 1940 to 1944, US industrial production grew at an average rate of 15 per cent per year, which was faster than any period before or since' [Kennedy 1992 358] From 1939 to 1945 manufacturing production increased 96 per cent agricultural production 22 per cent and transportation services 109 per cent [Link et al 1987 340] The US global share in manufacturing (as well as in mining) jumped from 42 per cent before the war to 62 per cent in 1946 [Itoh 1990 29] By the end of the war the US concentrated almost two thirds of the world's gold reserves [Kennedy 1992 358] Indeed, as Paul Kennedy observes regarding America's economic status in the aftermath of the war the world was its oyster [Kennedy 1992 358]

The end of the war also found the US with historically unparalleled military power Its arsenal included among others 1 200 major warships 2 000 heavy bombers 1 000 B 29s 12 5 million service personnel [Kennedy 1992 368] and an atomic monopoly that lasted until 1949

Armed with the mightiest military power and driven by the needs of corporate and financial capital and with anti communism as its banner the US imperial state proceeded to construct a global order on the principles of liberal internationalism under US hegemony The immediate project of the new emperors was to open the world to US goods and finances and rebuild those parts of the world where access to markets and investment sites could be assured In 1944 at the Bretton Woods Conference the US established the International Bank for Reconstruction and Development (World Bank) and the International Monetary Fund (IMF) The purpose of these two so called international institutions essentially instruments of power in US foreign policy was to provide loans to war torn European nations and promote private foreign investment (World Bank) and to secure access to global markets by reducing foreign exchange restrictions (IMF) The overarching goal of the World Bank and the IMF was to integrate nations into the system of world capitalism and thus counter the threat of socialist development [1] Essentially the Bretton Woods system rested on four pillars (a) an adjustable peg regime (b) a formula of subscriptions and quotas that would ensure an adequate volume of monetary reserves (c) a code of action' on currency convertibility and (d) an institutional forum for co operation on monetary issues [2] The US also organised the General Agreement on Trade and Tariffs to encourage free trade on US terms

In addition the US introduced a massive economic aid programme, the Marshall Plan, to prevent another depression and the collapse of capitalist Europe The dilemma faced by the US after second world war was that the purchase goods for the reconstruction of their economies This problem was referred to as the 'dollar shortage' and reflected the vast gap between US export and import values since 1945 The Marshall Plan was a way of providing dollars to the Europeans so they could buy US goods and open up their economies to US investors The Marshall Plan served above all the interests of corporate America which is why all the chief executive officers of US leading corporations - General Electric General Motors Merrill Lynch J P Morgan and Chase Bank supported the programme [Barnet 1973 152]

Similar aid programmes were implemented later to the countries and regions of the third world Between 1946 and 1979 the US disbursed $ 235 billion in aid $ 134 billion for economic purposes and $ 101 billion for military purposes Loans constituted 33 per cent of the economic aid and 15 per cent of the military aid Over the years the preponderance of aid and loans went to countries that were particularly relevant to the cold war struggle with the Soviet Union After the first decade when aid went primarily to Europe countries in Asia such as South Vietnam Taiwan and South Korea were targeted for aid as were Middle East and Persian Gulf countries such as Israel Iran and Pakistan [US Department of Commerce 1980 867 70] Foreign aid was (and remains) a way for the US to increase its power over other nations as well as to serve the interests of the business world by making countries dependent on American companies Aid represents a structural relationship between the advanced capitalist world and the third world and is an integral part of imperialist exploitation [3] Foreign aid is a strategy pursued by the imperialist powers because it causes structural dependence of the state on processes of private accumulation which encourages a form of integration into the capitalist world economy that prepares a way for penetration by international capital [Wood 1980 6 1986]

The combined effects of US foreign assistance programme and the pressures of the IMF and the World Bank translated into big gains for multinational corporations and banks The value of US exports rose from $ 10 billion in 1950 [US Department of Commerce 1951 817] to $ 143 in 1978 [US Department of Commerce 1979] Also US direct foreign investment grew from $ 13 billion in 1950 [US Department of Commerce 1952 827] to $ 220 billion in 1980 [US Department of Commerce 1983 823] The percentage of corporate investment in foreign operations doubled by the late 1970s over such investments in the 1950s because rates of profit were typically much higher for foreign over domestic investments [Weisskopf 1972 430]

Having prepared the ground for smooth international economic exchanges, commerce and trade, the US imperial state took immediate steps to protect its control over the world economy by embarking on a policy of militarisation and nuclearisation structured around an entangling alliance of western nations the North Atlantic Treaty Organisation (NATO), and creating a world-wide network of military bases diplomatic ties, intelligence operations, and propaganda activities The commending guide behind the militarisation of the global struggle of the US for hegemony was the Truman Doctrine Invoked in 1947 in reaction to developments in Greece in particular where communist forces were engaged in a civil war against fascists and the monarchy the Truman Doctrine declared that the US had the right to intervene in order to protect free peoples from communist subversion That the side the US chose to intervene in the Greek civil war on behalf of was collaborating during the war with the Germans, or that the com munist movement in Greece had broad based popular support among the people th oughout the country the Truman administration chose conveniently to suppress from the American public as it sought to gain support for its global militarist agenda

The Truman Doctrine had dramatic effects both on America and the world It created a police state generated in anticommunist hysteria that led to McCarthyism [11] was applied to Korea and produced countless of covert military operations and counter revolutionary strategies throughout the third world as well as in eastern Europe In the 1950s it led to more military alliances and brought about sharp increases in defence expenditures the US defence budget increased from some $ 13 billion in 1950 to over $ 48 billion by late 1951 a total increase of 257 per cent [Gaddis 1982 113] Under the Eisenhower administration the US supported Korea s army at a cost of $ 1 billion per year and was financing 80 per cent of the costs of France s war in Vietnam [Graebner 1984 182] When the US decided in the early 1960s to become militarily involved in Vietnam the only war the US ever lost and which costed the American economy between 1965 and 1971 an excess of $ 120 billion [15] the policies were still framed in the context of the logic behind the Truman Doctrine

Between 1945 to the end of the 1960s the US ruled the capitalist world virtually uncontested Its military capacity, economic dominance, and worldwide network of clandestine intelligence operations left the US as the only power with the ability to dictate policies on its own terms The US took it upon itself not only to single-handedly rebuild both Europe and Japan but also to challenge any threats to capitalism – the Soviet Union, communist movements, nationalist regimes and national liberation movements Superimperialism is the term to describe the political and economic configuration of the world capitalist system in the years following the end of the second world war as no other capitalist imperialist power could contest US global economic, political, and military supremacy

Domestically the period between 1950 and 1972 represented the 'Golden Age in the evolution of US capitalism With a world trying to recover from the devastation of the war, and with the discovery of the Keynesian doctrine of peacetime monetary management the U S economy experienced unprecedented levels of prosperity Between 1947 and 1972 the GNP grew at an average of 3 7 per cent per year [Duboff 1989 111] and there was an 80 per cent increase in per capita real disposable income [Duboff 1989 93] By 1959 agricultural output was 25 per cent higher than what it was in 1949 [US Government 1960 27] Throughout this period the US was the leading country in per capita gross domestic product [Bowles et al 1990 463] Nevertheless, what is most remarkable about this period is that in spite of the overwhelming edge the US had in the world economy its economy was never free from economic recessions and unemploy ment The first post war recession between 1948 49 saw unemployment rise from a low 3 4 per cent in 1948 to over 6 0 per cent early in 1950 The unemployment rate did not fall to its 1948 level until 1953 after a few years of sharp increases in defence spending Yet unemployment rose again to 5 8 per cent between 1953 54 due to an econo mic recession that lasted for 13 months In 1958 after three years of economic expan-sion unemployment climbed back up again to a high 7 5 per cent and industrial production drops 13 per cent between mid 1957 58 [16]

The recessions of the 1950s proved that capitalism is incapable of maintaining sustained economic growth for a prolonged period of time and that no matter how advantageous the economic circumstances are unemployment is a problem that it can never resolve Massive military spending was the primary stimulus to the economic growth of the 1950s and the 1960s Between 1947 and 1970 some $ 1 100 billions were expended for military purposes [Melman 1971 3] Numerous studies indicated, furthermore, that once the war stimulus ended, the economy reverted to slow growth' [Duboff 1989 99] [17]

Finally the period of US hegemony between 1945 and 1973 did not mean that the world had subjected itself totally to the order of Pax Americana The Chinese Revolution in 1949 was a severe blow to the interests of global capitalism and opened up a new era in the history of international socialism The consolidation of the socialist bloc in eastern Europe by the early 1950s was yet another major setback in the struggle of US imperialism toward complete global expansion and conquest During the 1960s the world saw a growing opposition to US imperialism and revolutionary ferment was spreading rapidly around the third world, with the Cuban Revolution in 1959 serving as a model for many Latin American anti-imperialist movements in particular Further, while the US involvement in Vietnam deepened, political instability at home and opposition to the war also threatened US hegemony The civil rights movement, the anti-war movement, and growing tensions in capital-labour relations were putting extra pressure on capitalist accumulation [Gordon et al 1987 43-57] Indeed, by the late 1960s it was becoming apparent that the US economy was entering a crisis and that the base of its global hegemony was being eroded Because of the high cost of the Vietnam war signs of movement toward economic stagnation surfaced, including higher inflation and unemployment rates Capitalist competitors were also now gaining ground on US manufacturers as West Germany Japan and France had rebuilt their economies and were becoming actively involved in the struggle for international markets Finally after the Tet offensive in 1968, the Vietnam war had clearly become a military sinkhole' [Ferrell 1988 358] and the obstinance resistance of the Vietnamese people showed the world that US imperialism was not indefeatable The anti-imperialist struggle of the Vietnamese people and of all the millions of people throughout the world resisting US hegemony proved that the struggle for justice and self determination can defeat even history's most powerful empire

III
Crisis of US Imperialism

Since 1973 the US economy has entered a major economic crisis (along with the rest of the world) of the magnitude that beset the economy from 1870 to 1890 and from 1929 to 1941 The contemporary crisis is associated with the collapse of the social structure of accumulation that was institutionalised the years following first world war [Bowles et al 1983, 1990] [18] and, while the instability caused by it will not in itself bring about the collapse of the capitalist system, it has led nonetheless to the breakdown in US hegemony The framework of the accumulation of capital after the second world war was based on the following conditions (1) the absence of inter-imperial rivalry, (2) a long wave of industrial technological development, (3) a cheap supply of primary products (especially oil) from the third world and the Middle East, and (d) labour accommodation [Itoh 1990 27-45] The collapse of the social structure of accumulation was brought about

by significant changes in economic conditions the resurgence of intercapitalist competition, new technologies the shift from industrial capital to the ascendancy of financial capital and capital-labour conflict in the late 1960s and early 1970s

The economic decline of the US can be easily established as early as 1970 This was largely due to the emergence of the Europeans (Germany and France in particular) and the Japanese as economic competitors Since the early 1960s the other major capitalist nations had been registering rates of productivity growth much higher than the US While the rate of productivity growth in the U S was 1 9 per cent per year between 1963 to 1973 it was 8 7 per cent for Japan 4 6 per cent for Germany 4 6 per cent for France 5 4 per cent for Italy and 3 0 per cent for Britain [US Government 1980 85] The facts about the economic decline of the US are revealing In 1950 the U S produced 51 per cent of the world s crude petroleum by 1970 it produced only 21 per cent In 1950 the U S produced 46 per cent of the world s steel in 1970 only 20 per cent In 1950 the US produced 35 per cent of the world s coal in 1970 26 per cent Even the production of wheat declined from 17 per cent to 12 per cent The U S share of the world exports also declined during the same period from 17 per cent to 12 per cent [Perrucci et al 1988 15 16] In addition in 1950 the GDP of the U S was 40 per cent more than that of France West Germany Italy, Japan and England combined [Szymanski 1975 66] In 1972 the combined GDPs of these five capitalist nations had risen to the point that it was now almost equal to that of the U S [Szymanski 1975 66] In 1949 the US had in its possession $23 4 billion in gold by 1971 it held only $10 1 billion in gold [Marmelstein 1975 13]

With the decline in the US share of world exports which was simultaneously accompanied by a sharp rise in imports the US balance of payments reached a record deficit of $30 billion in 1971 [U S Government 1972 113] In 1972 the US imported $ 4½ billion more in goods and services than it exported [US Government 19 3 115]

Reflecting changes in the world economy which produced a disequilibrium in world payments the US announced on August 15 1971 the suspension of the convertibility of the dollar into gold held by foreign monetary institutions and thereby bringing to an end the post war international monetary arrangements established at the Bretton Woods conference in 1944 The suspension of the convertibility of the dollar into gold was announced by the US without consulting with its allies a clear testimony to the fact that Nixon and the US foreign policy elite in general still regarded the US as the power upon which the rules of the international system depended

The 1970s were characterised by instability, inflation, unemployment, and stagnation Sharp declines in productivity growth were experienced by all the advanced capitalist countries Between 1973 and 1979 the rate of productivity in the U S was 0 1 per cent per year [US Government 1980 85] During this period the rate of productivity in the leading European countries and in Japan fell on the average by half yet it still remained higher than the U S rate of productivity growth for the period 1963 to 1973 Thus the rate of productivity of America s economic competitors was higher than that of the U S both during the 10 year period between 1963 and 1973 as well as during the first six years since the eruption of the 1973 crisis

Growth of real GNP in the OECD countries fell to zero in 1974 [U S Government 1975 187] This was partly due to the oil crisis that erupted in October 1973 and January 1974 when the Organisation of Petroleum Exporting Countries (OPEC) raised five fold the price of crude oil over September 1973 which caused huge current account deficits in all oil importing countries but also due to the general slow down in economic activity that emerged in the late 1960s [U S Government 1975 188] Immediately following the oil crisis the capitalist economies fell under the grip of stagflation an economic phenomenon that combines high levels of inflation and unemployment at the same time Unemployment in the U S reached 7 2 per cent in late 1974 and the consumer price index rose 11 per cent [U S Government 1975 86 130]

While the oil crisis affected severely the entire capitalist world it was the third world that suffered the most as most of those countries were forced to increase their borrowing from international financial institutions and private banks in order to maintain their own economic development projects and hence going even deeper into debt OPEC assistance to the third world was minimal The overwhelming share of OPEC profits reflowed into the credit markets and the banks of the advanced capitalist world In 1974 $ 11 billion out of a $ 60 billion OPEC surplus in oil profits found themselves in the US [U S Government 1975 195] Indeed one of the most profound developments in the world economy in the 1970s was a dramatic increase in private international banking activities with US banks playing the leading role In 1960 there were 8 US banks with 131 branches and $3 5 billion in assets overseas By 1974, there were 129 U S banks with 737 branches and $ 155 billion in assets abroad James Hawley reported that the total assets of all US commercial banks in 1960 were $ 255 7 billion in 1967 they were $ 448 9 billion and in 1974 $ 872 billion Furthermore he estimated that while domestic assets grew by 3½ times during this period, foreign assets increased by 42 times [Hawley 1978 130]

US capital was becoming more internationalised during the 1970s than any other time since 1945 From this point on, and because of the entry of new global competitors, the US imperial state looked increasingly more toward the organisation of capital markets and the facilitation of global financial operations in general rather than industrial development around the world The burden for this new economic global activism was to fall on the domestic economy

As the 1970s were coming to a close the U S economy was ever tighter under the grip of stagflation as oil prices had more than doubled in 1979 In 1980 the unemployment rate was still 7 5 per cent the inflation rate was 9 per cent and growth in real GNP registered 0 6 per cent [US Government 1980 160] The problem of capital flight already a decade old was getting worse and factories were closing down throughout the country The US was rapidly deindustrialising [Bluestone and Harrison 1982] and converting itself in the process into a service oriented economy with the non productive and financial sector of the economy gaining the upper hand over industrial capital Concomitantly US investments overseas continued their upward trajectory In 1965 total U S direct foreign investment (DFI) was less than $50 billion but in 1975 US DFI rose to $124 billion and in 1980 to $213 billion [Harrison and Bluestone 1988 26]

Rates of profit from DFI grew from $ 5 2 billion in 1965 to more than $ 424 billion in 1980 [Harrison and Bluestone 1988 26]

In the era of the internationalisation of capital a process of capital disinvestment in the domestic economy and capital flights to areas of the globe where the rate of profit was greater had become the operating framework of US capitalism The outcome was huge profits for the multinationals and the banks and long-term unemployment declining living standards and growing poverty for the working class

During the 1970s US imperialism was faced with many critical challenges Vietnam, Laos, revolutionary ferment in the third world, including the call for a New International Economic Order, the seeming vibrancy of the socialist countries, and declining economic power were forcing the world's most powerful empire into the defensive In such a climate, the US imperial state embarked on new strategies to enhance the capacity of the US to maintain control of the global political economy The new strategy worked out in Washington in 1972 was detente a policy designed to gain co operation from the Soviet Union on issues

time, but it is stated that if later on private finance is prepared to take over these industries, state ownership may be replaced by private ownership. However, it is essential in the public interest that the state should retain effective control over them. Moreover, in sharp contrast to current positions on the plan and the market the document states clearly that the distinction between 'capitalism' and 'socialism' is overdone and that no economic organisation can function effectively or possess lasting qualities unless it accepts as its basis a judicious combination of the principles associated with each school of thought [Baru 1995].

Although the state set out to create the basis for an independent capitalist economy, in practice it was forced to accommodate foreign capital to a greater extent than was envisaged in the initial plans. In contrast to Africa and Latin America, foreign capital and investment has been less prominent in India However, the Indian state had to compromise by accommodating foreign capital, in the early 1960s, under the Third Plan, primarily because of resource constraints [Singer and Roy 1993:134]. This was exemplified by industries like chemical fertilisers, where the terms and conditions including gaining access to foreign financial support, technology and know-how, and the conditions for the participation of multinationals, had to be relaxed [Dhar 1985; Roy 1990:85-99; 106-14].

The capacity of the state to carry out investment is of critical importance in realising its plans. Until the mid-1960s the Indian state was able to use a combination of taxation, domestic borrowing (at low and often negative real interest rates) and external aid based on concessional loans, to implement industrial growth. Thus, the growth rate of industrial production fell from 7 per cent between 1951-65 to 3.3 per cent between 1965-70; over 1970-77 it increased to 4.8 per cent, but again declined by 1.4 per cent between 1979-80 [Patnaik 1979:13; Harris 1983:16]. Since the mid-1960s the rate of growth of some industries has been negative. The sharp deceleration in industrial production was accompanied by unutilised capacity in a number of industries, stagnation of investment, shortage of foreign exchange and imports of foodgrains [Government of India, Fourth Five-Year Plan (1969-74):3].

A combination of explanations, rooted in India's political economy, contributed to the Indian state's inability to combat industrial stagnation. This throws light on the constraints which confront attempts through collective action to change state policies.

The first explanation places blame squarely on state intervention in the economy and calls upon market forces to govern economic activity. The 'neo-liberal' school of thought has been a major influence in moulding this approach. Comparisons between India and the 'market paradise' within which east and south-east Asian economies are said to function, show India in an unfavourable light. The public sector in India has been attacked for being 'flabby' with 'labyrinthine' controls on private industry [Roy 1984:56].

The second explanation centres on the nature of public investment and the structure of demand. A decline in public investment, a skewed distribution of demand and insufficiency of agricultural growth have been major contributory factors. In the first case, the fall in state investment, brought about by a shortfall in external resources, coupled with inability to tap domestic resources, have been of key importance [Roy 1995]. Backlogs in power generation, constraining transportation and fuel, have emerged [Rubin 1985:945]. Secondly, the pattern of income distribution and its consequences for consumption and saving, have slowed down and limited the scope of stimulating production of industrial goods. Lack of adequate agricultural growth has also inhibited the role of this sector in stimulating demand for industrial goods. These problems require exploring the relationship between economic policies and the underlying political structures [Roy 1990:88-91].

The explanations need to be seen in the context of the state, property relations and development policies. One major analysis suggests that the Indian state comprises a coalition of interests of three proprietary classes, the capitalist class, the agricultural rich and the professionals, including the white collar workers. The third class, which is not usually included among the proprietary classes, is also a part of this coalition. Intra-coalition conflicts are put forward as the explanation, in spite of a trend towards a higher savings rate, for current expenditures ending up consuming the bulk of resources and the inadequacy of public investment even in sectors as crucial as railways, power and irrigation. The diverse interests of the dominant coalition of the proprietary classes pull in different directions, and when none of them can dominate, the allocation of resources leads to a proliferation of subsidies and grants to placate all of them. This reduces available surplus for public capital formation [Bardhan 1984; Varshney 1984:1516]. Indian political economy emerges as an elaborate network of patronage and subsidies, contributing not only to the decline in public investment but also bringing about chaos with the management of the Indian public sector [ibid]. The nature of the relationship between Indian democracy and the factors which have given rise to such a coalition demand further investigation [Roy 1995]. This needs to be considered by leading exponents of the market based explanation, such as Lal, who allege that 'the dirigistic dogma,' based on the belief that the price system should be supplanted and not just supplemented has plagued the Indian economy [Lal 1988:24]. Despite the unsophisticated nature of Lal's arguments in an age avid for simple political messages, the power of such ideas should not be underrated [Toye 1985:2]. Of course, some of Lal's criticisms centring on the efficiency of government controls in developing countries, need to be explored. For instance, the state could adopt a less cumbersome and costly way of achieving its objectives, as has been supported by recent research on the Indian system of industrial licensing [Toye 1985:3-4]. Management of state activities, including the public enterprises, should not be ignored. However, the attack on the public sector has often been misplaced. There has been a failure to grasp that a large number of private units have had to be taken over by the state because of endemic sickness, exemplified by jute mills, mini steel plants, pharmaceutical and engineering units, and a large part of the textile industry. Yet, the private sector has been considered to be efficient [Bagchi et al 1985:12].

A number of fundamental weaknesses have emerged in the capacity of the state to raise adequate resources and act in the interest of the masses. Basically, the state was unable, as in the previous periods, to tap sources for public investment. This stemmed from a slowing down of industrial investment and led to disincentives for private investment given a direct relationship between public investment and private corporate investment [Rangarajan 1982:601; Harris 1983:9; Roy 1995]. The state had relied on a combination of foreign aid and deficit financing to implement public investment. Foreign aid as a percentage of GDP fell from its peak of 3 per cent in 1966-67 to a low of 0.5 per cent in 1972-73 and 0.6 per cent in the late 1970s [Ahluwalia 1985:104]. Increasing direct taxation of the propertied urban and rural classes could have compensated for the shortfall in resources. A combination of state inertia to raise taxes and the mechanisms for preventing the execution of such policies have seriously handicapped the use of fiscal instruments in encouraging growth and social justice. In this respect, agriculture which has contributed about a third of national income, has been virtually free from direct taxation. Direct tax on agriculture formed less than 1 per cent of total agricultural income, while land revenue was a flat rate levy and regressive. This has led to considerable pessimism such that "in the field of direct taxes the possibilities of raising additional resources through income taxes, corporation taxes

of arms, economics and international security To attain co-operation from the Soviets, the US begun to pay more attention to the Chinese In light of the split of the Sino-Soviet bloc at the end of the 1950s and the growing hostilities that had developed between the two socialist giants, an American-Chinese rapprochement was certain to gain the attention of the Soviets Indeed, at the 1972 Moscow summit Nixon and Brezhnev signed the Declaration of Principles, which pledged greater co-operation among the two superpowers on several key areas including 'rules of mutual non-intervention in the other power's sphere of influence and in third-area conflicts" [Brown 1983 332] However the policy of detente did not curb Soviet or Chinese influence in the third world, did not lead to a North Vietnamese withdrawal from South Vietnam (a central objective behind US openings to China), and did not stave off the pattern of the declining political economic and military power of US imperialism As a matter of fact US global strategic interests suffered additional blows in 1979 with the fall of the Shah in Iran a hitherto impregnable ally of the US and a watchman over the vital oil resources in the Persian Gulf with the coming into power of a revolutionary movement in Grenada in March and with the success of the Sandinista movement in Nicaragua in overthrowing in July Anastasio Somoza, yet another US-backed dictator and a longtime defender of US corporate interests in Nicaragua

In view of these defeats the US imperial circles decided to put an end in the late 1970s to the policy of detente and renewed the cold war Using the Soviet commitment of troops in December 1979 to save a beleaguered allied regime in Afghanistan from the reactionary forces of Islamic fundamentalism, the Carter administration increased dramatically defence expenditures, created a rapid deployment force in the Persian Gulf, established a Caribbean military headquarters, increased military assistance to countries from Pakistan to El Salvador, and ended the SALT process with the Soviet Union

The coming to power of the Reagan administration in January 1981 only heightened the intensity of the cold war Reagan militarised the US economy in a way that would have made proud the architects of NSC-68 back in 1950, a policy paper that called for commitment of 20 per cent of the GNP to defence spending in order to maintain US globalism and contain Soviet communism Demonising the Soviet Union by labelling it 'the evil empire', and proclaiming that the empire had 'surrogates' around the world that engaged in terrorism (Libya, Cuba, Nicaragua, and the Palestine Liberation Movement), Reagan and his henchmen engaged in an all out war against socialist and progressive governments and movements Through military support of counter-revolutionary movements such as the Contras in Nicaragua, Unita in Angola, and the Islamic fundamentalists in Afghanistan, US imperialism was able to inflict catastrophic damage to socialist economies in the third world and directly assist in the killings of millions of people Through clandestine operations and financial assistance to pro-western capitalist elements, US imperialism was also able in the 1980s to destabilise eastern European socialist economies and assist in their collapse

US imperialism in the 1980s marked the return of outright militarism pathological anti-communism and fervent Americanism combined with massive assaults on the working class and its institutions on behalf of corporate and finance capital Internationally the 1980s represented US imperialism's desperate but determined struggles to refashion a global empire invasions in Lebanon Grenada, Panama and the bombings of Libya were the highlights of the brutality of US imperialism Domestically, the 1980s were a decade of financial speculation corporate mergers and takeovers record breaking defence spending and huge deficits economic displacement poverty and polarisation

Given the need to respond militarily to challenges to US imperialism throughout the world and to stimulate the battered US economy U S defence outlays more than doubled during the 1980s 'from $134 billion in 1980 to almost $ 300 billion in 1988 [Hanson 1993 158] This represented the biggest increase in defence spending since the second world war with the total for the period approaching $ 2 trillion [Centre for Defence Information 1987b 1-3] Nuclear fighting alone accounted for 22 per cent of military spending between 1981 and 1987 [Centre for Defence Infomarmation 1987a 2] Nuclear weapons research rose from $ 3 2 billion to $ 10 billion [Centre for Defence Information 1987a 3] Military aid also experienced dramatic increases during the 1980s it "more than doubled each year, from $ 2 1 billion to $ 4 8 billion [Hanson 1993 126]

In light of the declining influence of US imperialism, economic aid went through a radical shift from loans to grants Jim Hanson reported that while in 1970 US economic aid was $ 1 4 billion in loans and $ 2 3 billion in grants, by 1989 economic aid considered of only $ 694 million in loans and $ 9 2 billion in grants" [Hanson 1993 135] He correctly observed that "the shift to outright grants to the less developed countries indicated the increasing imperial concern over the economic and political stability of American dominions and peripheries" [Hanson 1993 135]

Reaganism left a haunted legacy behind it and it proved that unregulated capitalism 'free markets' is even more bankrupt than Keynesianism in dealing with the problems of contemporary US economy In the course of only four years Reagan's policies converted the US from being the world's largest creditor nation to the world's largest debtor nation The last time the US was a debtor nation was back in 1914 The deficit in US merchandise trade balance went up from $ 25 billion in 1980 to $ 160 billion in 1987 [Husted 1991 205] From a surplus in his technology products of $ 25 5 billion in 1983, negative numbers were recorded less than a year later [Merrill 1985 45], and by 1986 the US ran a $ 2 6 billion deficit for the first time in high technology trade [US Government 1989 236] As further indication of the decline in the competitiveness of the US economy under the Reagan administration, the US share of US-issued patents dropped from 73 per cent in 1970 to 52 per cent in 1987 as Japanese inventors increased their share of patents received five-fold [US Government 1989 229]

What went 'right' for the US economy during the 1980s were foreign investments By the end of the 1980s US foreign assets more than doubled the amount of assets owned at the beginning of the 1980s [Hanson 1993 145] Nevertheless, foreign investments in the US exceeded US investments overseas by $ 2 trillion [Hanson 1993 145] This development in the international financial relations of the US also represents a reversal to the conditions in 1914, causing many to decry the selling off America" [Omestad 1995 191-202]

Reagan's policies mortgaged the economic future of the American people for a long time to come While the federal debt in 1980 was $ 908 billion, by the end of Reagan's second term it had risen to $ 2 8 trillion Debt skyrocketed during the 1980s at all levels of American society as another method of Reaganomics to gain recovery of the economy was through consumption spending In this respect the 'net national saving rate in 1989 was less than 2 per cent, the lowest since the 1930s" [Wilber and Jameson 1990 107]

The attack of the Reagan administration's spite on the working class was massive and unprecedented in post-war America Real wages in the US, which had become stagnated since the early 1970s, fell in absolute terms throughout the 1980s [Cohen 1993 120] as labour was forced (under trade union leadership that had long ago become junior partners to capital and big business) to accept the logic of 'restructuring' and threatened with lay-offs if cuts in salaries, pensions, and benefits were not forthcoming Cuts in social programmes took place across the board and ketchup was classified as a vegetable in public schools [Collins 1995] With deindustrialisation in full swing and capital flight running rampant in pursuit of higher rates of profit overseas, traditional high-

paying blue collar jobs were rapidly disappearing and replaced in turn with low-wage/no benefits service oriented jobs [Loveman and Tilly 1988 46 65] Some 60 per cent of all new jobs that were created between the late 1970s and the mid-1980s paid less than $ 7,000 a year [Laxer 1989 5] Moreover, the rather paradoxical situation of fewer jobs and longer working hours became a standard feature of the US economy in the 1980s as capital was seeking to extract as much surplus out of existing labour power as possible since new hiring meant extra costs in benefits and pensions Not surprisingly poverty and crime reached a new pleateu in the 1980s and the number of homeless people in 1987 was estimated to have swollen to three million [Wilber and Jameson 1990 113] Finally under Reagan s economic policies the middle class dwindled but the total wages of all millionaires shot up 243 per cent a year [Barlett and Steele 1992 4]

The 1980s were the best of times for corporate and finance capital even though the 1990s under Clinton are shaping up to be even more prosperous Through vicious assaults on salaried workers and middle class wage earners huge tax breaks for the rich and the corporations and outright theft owners of US corporations were able to realise between 1982 and 1986 an increase of 92 per cent in profits *before taxes* and an ever greater rate of profit of 118 per cent after taxes [Harrison and Bluestone 1988 110] Indicative of the accumulation of wealth into fewer hands mergers increased by a wobbly 80 per cent between 1980 and 1986 with megamergers (those over $ 1 billion in value) being the rule rather than the exception [Leveson 1991 29 Kavier 1993] Deregulation which was supported with even greater fervour than Ronald Reagan himself by liberal democrats such as senator Edward Kennedy from Massachusetts, offered tremendous gains to monopoly capital as competition simply caused the evaporation of small business (in the trucking industry for example) and allowed capitalist predators to rip the public from billions of dollars Deregulation caused the largest ripoff in the history of US banking with the collapse of the Savings and Loans industry which is estimated to cost US taxpayers something between $ 500 billion and $ 1 trillion [Long 1993]

The Reagan policies as well as those of George Bush and Bill Clinton in the early and mid 1990s respectively can only be understood in the context of the specific economic trends and class developments taking place in the US and the global economy since at least the late 1970s The essence of the new economic framework revolves around the non productive speculative, and financial component of capital by the end of 1988 the net capital stock of financial real estate, and insurance firms was larger than that of all manufacturing industries combined [*Monthly Review*, June 1990] Indeed, by 1988 speculator capitalists replaced industrial and petroleum capitalists as the most dominant faction in the US ruling class [Petras and Davenport 1990 36] The base of operations of this class are the stock markets the international currency markets investments and pension funds The global market is their home field In this context the Gulf war of 1991 was just as much part of an effort on the part of the US imperial state to maintain the status quo as it was over oil production and concerns with disruptions of international capital markets

The financial economy' is the top priority of US policy makers in the current stage of the internationalisation or trans nationalisation of capital The expansion of US global power is driven by the aim to promote and protect financial markets The domestic economy has become a means of extracting the necessary resources to finance the global operations of capital The elimination of high-paying industrial jobs cuts in wages social programmes and benefits provide the resources through which the US imperial state supports the operations of finance capital overseas The US economy is thus shaping up as a two tiered economy a wealthy elite and derives its gains and benefits from the global economy and a labouring population that work at the minimum wage to support the international drive of capital In today s economic environment the difference in the American political system between democrats and republicans is over which side can best accommodate the interests of corporate and financial capital The ease with which Clinton backed away from his electoral promises to cut defence spending invest $ 20 billion a year over four years for rebuilding America and spend money on programmes that would directly create jobs speaks directly to whose interests he represents Clinton was backed in the 1992 elections by the largest US corporations over George Bush As president he is now repaying his debts to the masters of capital

IV
Conclusion

It has become very common in the last few years with all the talk about globalisation to treat imperialism as a movement built around international co-operation and unity and therefore to detach from it the contradictions, problems and sharp antagonisms built into the system as a whole or the effects associated with the political economy of imperialism in general [Steven 1994 271 96] The current status of US imperialism however goes entirely against such a mode of discourse as its decay as well as its continuing efforts for global supremacy is a direct expression of the economic rivalry among the major imperial powers for overseas expansion The new global economic framework that has come into the world stage constitutes a break with the past only insofar as there has been relatively little opposition to it than it has been the case in the past There are no indications of a global state' [Glyn and Sutcliffe 1992 93] (the UN has in fact been converted into an arm of US foreign policy) but only the reality of global exploitation In the context, therefore, of an ever present anarchic state system driven by different organisational units, and where the logic of capital accumulation reigns supreme competitive struggles among transnational capital, and conflict and discord among imperial states will always prevail over systematic co-operation

In the mid-1990s US global influence is of course still quite pervasive and will continue to be so for some time to come US imperialism holds preponderant military power and dictates economic life in many regions of the third world and has expanded power recently in eastern Europe It has also temporarily neutralised the ideological and political influence of socialism forced a retreat on third world nationalism and has strengthened its cultural grip on the world in a variety of disturbing ways Cultural hegemony can go a long way toward paralysing political and social change When the images of Hollywood or the sounds of hard rock and rap and hip hop music serve as the cultural stimulation of the youth around the world the force of US imperialism is alive and kicking

At the heart of these developments, I believe are the disintegration of the USSR the retrenchment of the Left the weakening of trade unions depoliticisation at the grass roots level and a sense of disempowerment owing largely to the structural changes in the workplace and a whole series of other seemingly amorphous and impersonal economic trends put out by the new wave of globalisation It is these transformation that define the new stage of the global political economy and enhance the position of US imperialism In failing to recognise this that political and social action (or the lack of it) is the determinant agent in recent economic developments we fail to recognise the possibilities for revolutionary action There is a huge gap today between the military and political power of the US and its capacity to support those forms of power economically The US economy has grown more and more impoverished over the last 20 years or so as its domestic resources are being plundered to finance global expansion To maintain the empire today costs $ 1 trillion annually And all this while the US society collapses under the oppressive weight of long-term unemployment declining living standards

sharpened economic polarisation, poverty, racism, deteriorating infrastructure, pathetic educational systems and so on. While US imperialism flexes its military muscle abroad and expands the interests of corporate and finance capital, 20 per cent of children and 45 per cent of black children in America live in poverty [US Government 1992: 150], the nation ranks almost dead last in maths and science skills among 15 industrialised countries [*Business Week*, August 15 1994] and Japanese investors are financing one third of the US government budget deficit [Hanson 1993: 145].

In many ways the US is beginning to resemble what the former Soviet Union had become by the late 1970s – a paper tiger. The current state of the political economy of US imperialism is such that there is a geometric correlation between Gulf war military campaigns and Los Angeles type of riots. It may very well be the case that the duped eastern Europeans believe still that the US will come to the rescue of their economies. But it is for the first time perhaps in modern US history that the new generation of Americans is identifying the US not by its successes but rather by its failures. The challenges now for the Left is to turn that disenchantment into political action.

Notes

1 This is the title of a recent book by Samir Amin, *Empire of Chaos* (1992).

2 Charts comparing US productivity growth with the other G-7 nations can be found in Cohen (1993).

3 The new imperialist order, which may be labelled as multinational imperialism, requires that the different imperialisms work together at times to support the whole structure of the world imperialist system and to enforce discipline among the peripheral nations, especially on those seeking to upset in any form or shape the extant framework of order. However, the different imperialisms are first and foremost competing against each other to dominate and monopolise ever larger portions of the world market. Thus, discord and conflict rather than co-operation are certain to characterise in the end future state and regional relations.

4 Advocates of this mode of reasoning and analysis are, among others, Gill and Law (1989), Kees van der Pijl (1984) and John Willoughby (1991).

5 While rather various in the way they interpret the implications of a borderless world economy, Glyn and Sutcliffe (1992) also reach the same conclusion.

6 The concept of the imperial state was originally introduced by Petras and Morley (1980, 1989) in the effort to understand not only the economic but also the political dimensions of imperialism. A good discussion pertaining to the formation of the capitalist state and its international connection can also be found in Piccotto (1990).

7 The classic Marxist work on imperialism is that of V I Lenin. First published in 1917, this work provided a composite picture of the world capitalist system in its international relationship at the beginning of the 20th century – on the eve of the first world imperialist war' (1975:3).

8 The connection between business and political elites in the so called 'progressive' era is spelled out in a rather controversial analysis about the economic developments in the US during the first 15 years of the 20th century by Kolko (1963).

9 This point is well noted in Graebner (1984), an otherwise typical bourgeois analysis of US foreign policy where capitalism and imperialism receive not even a single entry in the index.

10 This is a title used by James Weldon Johnson, a black poet and leader, to describe the 1919 race riots and is quoted in the work of Franklin and Moss, Jr (1994).

11 For outstanding treatments of the role of the IMF and the World Bank, see the works of Payer (1974, 1982). Also see Danaher (1994).

12 For a brief discussion of the origins and goals of the Bretton Woods system, see Cohen (1995).

13 One of the best analyses of aid as a means of imperialist exploitation remains that of Pierre Jalee (1968).

14 For an excellent account on McCarthyism and its effects on American society and the world, Griffith (1988).

15 For analyses of the total cost of the Vietnam war on the American economy, see McCarthy (1971) and Clayton (1971).

16 Data for unemployment rates during the economic recessions of the 1950s are derived from the economic chronology found in Mermelstein (1975).

17 Duboff's own analysis establishes a clear connection between military spending and economic growth (pp 95-101). Another study showing the same correlation and cited by Duboff is that of Vatter (1963).

18 For a recent survey and critique of the theory of the social structure of accumulation, see Kotz (1990). Within the Marxist tradition there are contending theories of capitalist crises. Ernest Mandel's (1975) was the first work to provide a detailed insight into the contemporary rise of capitalism through a revised version of the long cycles theory and remains still a powerful explanatory analysis in what I believe was when first published a work ahead of its time.

19 I do not mean to portray anti-communism as a form of pan-moral anti-communism is a political weapon that works on people's fears. See, for example, the studies in Joel and Erickson (1987).

20 A collection of essays covering the multiplicity of issues and interests involved around the Gulf war is gathered in Peters (1992).

New Institutional Economics, State and Development

Some Conceptual and Empirical Issues

Sumit Roy

Resource allocation through the state or the market or through both has occupied major interest in economic theory and policy. Hence the role of the state and the market, the former symbolised by various forms of intervention and the latter by neoclassical economics and pricing, has preoccupied analysts. Debates have raged over 'state failure' and 'market failure' with the search for new theoretical approaches. In this context New Institutional Economics (NIE) focuses on analysing the conduct of rational individuals under various forms of market failure. Basically a social dilemma emerges when radical individualism becomes inconsistent with social welfare such that the choices made by rational individuals yield outcomes that are socially undesirable [i.e. not Pareto optimality] with market failures yielding social dilemmas. NIE professes that institutions provide the mechanisms to enable individuals to escape the tension between individual and social rationality created by the perverse incentives that produce the failure of markets. While NIE sets out to build on, modify and extend neoclassical theory, it functions firmly in the realm of scarcity and competition. An analysis of NIE for development demands a fuller understanding of the interaction between the state and development policies. This paper aims to highlight some of the key conceptual and empirical issues which impinge on NIE.

I
New Institutional Economics and Development

RESOURCE allocation through the market or the state or through some combination of both has been the focus of interest in economic theory and policy making. Hence the use of either the market based on neoclassical economics and underpinned by pricing or the state symbolised by government intervention is of major importance in understanding the process of growth and development. However both allocative mechanisms may deviate from their norms. Thus the necessary and sufficient conditions for fulfilling pareto optimum through the pricing mechanism may not be met because of imperfect markets, externalities, inability to supply particular goods and services and information deficiencies. Similarly state or government interventions may lead to allocative distortions with inefficiencies in production and consumption. Underpinning the role of the state and/or the market is the access of different classes to state power which is the cornerstone of decision-making over policies.

In this context new institutional economics focuses on the study of the conduct of rational individuals under various forms of market failure. A social dilemma emerges when radical individualism becomes inconsistent with social welfare such that the choices made by rational individuals yield outcomes that are socially undesirable [i.e. not pareto optimality], with market failures yielding social dilemmas. The core argument of NIE is that institutions provide the mechanisms to enable individuals to escape the tension between individual and social rationality created by the perverse incentives that produce the failure of markets. It builds on and modifies neoclassical economics in order to resolve the problems of market failures through allocative mechanisms such as property arrangements, private contracts, communal/community arrangements and collective provision.

Analysis of NIE can be divided into two broad approaches: first, efficiency improving institutional change through a reduction in transaction and information costs and second, the theory of collective action [Nabli and Nugent 1989]. Moreover the emphasis on the effect of an institutional change on control of surplus by a particular class also suggests that the question of efficiency improving institutional change cannot really be separated from that of redistributive institutional change. This is particularly the case when issues of collective action, bargaining power, class capacity, mobilisation and struggle in the historical process are important [Bardhan 1989]. Given that the role of the state [often referred to in the NIE literature as the 'government'] is emphasised in both the transaction costs and collective action components of NIE, both approaches have to be interrelated and complementary [Nabli and Nugent 1989].

Neoclassical institutional economists have concentrated on efficiency improving institutional change. While NIE sets out to correct market deficiencies, in an attempt to bridge differences between individual and societal motivations, it functions firmly in the realm of scarcity and competition [North 1993, Bates 1993].

Basically the assumption of Walrasian neoclassical economics that equity and efficiency are separable breaks down when transaction costs and imperfect information are important. The terms and conditions of contracts in various transactions which directly affect the efficiency of resource allocation now depend crucially on ownership structure and property relations. Institutions which can lower transaction costs are the key to performance of economies. Costs of information, negotiation, monitoring, co-ordination and enforcement of contracts [Bardhan 1989]. If institutions are defined as those rules, norms and customs and their enforcement characteristics which define rights and responsibilities in economic transactions, no one can dispute that it is important to analyse how differences in economic organisation are shaped by political, social, cultural, religious and legal conditions, i.e. by factors commonly referred to under the rubric of 'institutions' [North 1993, Bates 1993].

The interaction between institutions and organisations lies at the core of NIE. Institutions focus on rights and obligations in economic transactions while organisations [economic, social, political] which integrate the interests of different groups, shape and are in turn shaped by institutions. A change in relative prices under neoclassical institutional economics makes relative price changes the driving force behind institutional change in history.

The creation of property rights embodies a major response to the problems of external effects, making it in the private interests of maximising individuals to make socially appropriate production decisions.

NIE professes to offer a radically different development policy than those of either traditional development economists or orthodox neoclassical development economists. Neoclassical economists have assumed implicitly that institutions do not matter and that 'getting prices right' should guide policy. However "getting prices right" only has the desired consequences when you already have in place a set of property rights and conferment that will then produce the competitive market conditions [North 1993].

As a result of the creation of property rights the producers incur financial costs or reap financial benefits. The overlaying of market relationships on top of the physical relationships provides economic incentives for the agents to take into account the external or social impact of their production decisions. Public goods also constitute a source of market failure. In this case interdependence exists not between the production functions of firms but rather between the utility functions of individuals, if its consumption by one individual does not diminish the utility derived from its consumption by another the consumption of the good is non rivalrous and its provision non excludable. People basically fail to finance as much as they truly desire.

The theory of collective action is shaped by individual motivation with the self interested individuals undertaking action which can benefit them collectively. Collective action poses critical questions on the relationship between interest groups and the state. The state may be playing a mediating role positively responding to interest group pressures and in turn the need to evaluate the relative influence of different groups. But frequently the state and its agents are not neutral and passive bystanders in the process of group interaction giving rise to a positive theory of rent seeking. Interest groups may use different means to accomplish their aims. Thus interest groups can use the state to fulfil their sectional demands by influencing voting patterns, legislation and regulating agencies, administrative budgets, rules and judicial decisions. Moreover the theory of rent seeking has been developed and applied to developed countries within an institutional framework of responsible government but developing countries have been characterised by autocratic governments and bureaucracies. This implies that the theory and its predictions can be transferred to developing countries [Nabli and Nugent 1989].

The actions of the state can affect transaction and information costs and hence choice of organisational forms and types of controls. Different groups or agents have the incentive to organise themselves in such a way as to influence those state decisions in the protection of their interests.

Individuals or groups who may find existing institutional alternatives or macro rules or other institutions inefficient or inequitable or both can engage in collective action to bring about an improvement in the situation.

The critiques of NIE have posed questions on its relevance and its application. This includes issues such as its role at the micro and the macro level, in the short and the long term, and the need to grasp more fully the ways in which the state can thwart or advance the process of socio economic change. It has been claimed that NIE can have a wide and varied range of application to the micro or sectoral development problems, but it is limited in terms of its usefulness as a grand theory of the development process in its optimising only for the present or the short term, and even at micro or sectoral level it may abstract from requirements of future development [Toye 1993: 17-18].

It may be realistic to argue that NIE provides a framework for enhancing the efficiency of markets while the state plays a supporting role by regulating, mediating and intervening to reform institutions not subject to market pressures [Toye 1993: 16]. But an understanding of real life economies demands bringing institutions and power relations into formal models [Basu 1986]. Moreover, while the state can create a favourable environment in which markets can function, this captures only one dimension of the role of the state which encompasses a wide range of interventions to shape the development process. In this respect, there are major doubts about the extent to which Public Choice Theory has contributed in a decisive way to an increased understanding of the role of the state and of institutions in the economy. The theory offers no solution to the critical question of how to incorporate the state in a theory of economic development, repeating an old and familiar story that government intervention is a brake on the efficiency of the market and hence should be kept to a minimum. The empirical evidence of this dogma is weak. In order to trace the causes and origins of this intervention in the economic sphere an analytical framework which goes beyond the boundaries of those theories has to be developed [Gunnarsson 1993]. NIE claims to extend economic theory by incorporating ideas and ideologies into the analysis, modelling the political process as a critical factor in the performance of economies as the source of the diverse performance of economies and as the explanation for inefficient markets [North 1993]. Thus to grasp more fully the relevance of NIE in resolving problems of development it is essential to confront the nature of the interaction between the state and development policies.

II
State and Development: Indian Experience

Section I emphasised that the analysis of NIE cannot be divorced from the role of the state in development. This demands confronting the socio economic forces which inhibit or advance state policies. In this context this section using India highlights first state intervention in the agricultural sector in the context of various forms of exchange relationships and second ways in which property relationships impinge on state policies under industrialisation and liberalisation.

Recent studies on neo-liberal policies rooted in neoclassical economics, at the global and the domestic level express doubts about such policies creating a firm basis for sustainable growth. The virtues of the neo liberal approach cannot be divorced from analysing more closely the quality of state actions which is intertwined with questions on access to and use of, state power. Current debates on understanding more fully the interaction between the state and the market must be conducted in this frame [Singer and Roy 1993: 164-65]; this can also be extended to the study of NIE which tries to resolve the problems of market failure.

Many studies unfold the domination of the Indian state by the major propertied classes. In this context debates have raged over class in itself, class for itself and class action embracing the division of society on the basis of control over productive forces and its implications for organising action to maintain and further class interests [Byres 1988 (a) (b)].

This has emerged against a background of changing relationship between the centre and the states with far reaching economic and political implications [Sathyamurthy 1989]. Some have considered interest rather than class as the basic motivating and organising principle of political economy attaching more significance to caste, tribe, status group, religion and linguistic factors. The notion of interest groups is composed of organised interests and demand groups. Interest groups embrace a voluntary association of individuals who band together to move public policy in a particular general or specific direction. The Indian state is seen as operating independently of the interaction of class forces and is a 'state in itself' [Rudolph 1988]. This thrust has been severely criticised for being divorced from the relations of production and property rights [Byres 1988(b)]. Of course at the level of political organisation, factors such as caste or religion may block or frustrate class action, and may necessitate the use of supporting mechanisms to challenge economic, social or political injustices.

NIE has been posed in the context of contractual choice within the agricultural sector embracing contracts between different owners of inputs used in production [Bardhan 1989] The forms of contracts have covered fixed rent contracts wage contracts and share contracts These have been paralleled by contractual relationships over exchange of outputs The nature of property relations within the agricultural sector does clearly have implications for the terms and conditions of exchange and ways in which the contractual arrangements can be changed The state can also play a major role in moulding this process

In this context property relations have influenced, and been influenced by state policies to accelerate agricultural productivity through attempts to revamp agrarian relations through land reforms (and spreading irrigation) in the period immediately after independence and subsequently (from the mid-1960s) through green revolution technological strategies with minimal disruption to the prevalent land relations This experience has important implications for attempts to either change rural property relations or use collective action to improve the conditions of the poor

The Indian state set out to create new property rights through land reforms, to displace specific groups who had acquired property rights in the colonial period, by new groups who could increase agricultural productivity Thus following independence the reforms focused on eliminating the intermediaries between the state and the peasants, the zamindars who were seen as the principal culprits in bringing about agricultural stagnation from the close of the 19th century onwards The large semi feudal landlords (the zamindars and the jagirdars) and the absentee, non-cultivating landlords were exposed to the reforms However the main beneficiaries of the land reforms were the rich peasants, who reinforced their status as independent proprietors and emerged as the new dominant class in the agrarian structure [Roy 1990 49-50, Byres 1981 420-21] The 1950s witnessed a mass eviction of tenants because of the fear of future land reforms Efforts were made to secure as much land as possible for personal cultivation Tenanted land also passed from the poor to the rich peasants Traditional sharecroppers continued to exist on an extensive scale The conditions of the landless labourers may have actually worsened in some areas [Byres 1981 424] The reforms made modifications at only the upper end of the agrarian structure, such that land tenure remained highly inegalitarian, with implications for power relations While, the large feudal landlords [zamindars and jagirdars] and absentee, non-cultivating landlords suffered a blow as a result of the reforms a small group emerged who were 'ripe for transformation into capitalist farmers [Byres 1981 423]

The land reforms set the frame within which the adoption of modern technology took place in the mid-1960s, and gave rise to critical questions on competition between industrialists and rural landlords for state power Inadequate growth of food production and the need to depend increasingly on food imports were major pressures behind the need to adopt technology to boost output per acre This was underpinned by the limits of land reforms and inability to extend land for cultivation External agencies such as the Ford Foundation, which had a major role in advising the government of India's food strategy in the late 1950s emphasised that land reform was not to discourage the development of a progressive group of cultivators with middle sized holdings Modern technology was based on key biological and mechanical inputs including new seeds chemical fertilisers and irrigation through tube-wells Specific strategies started emerging in the early 1960s through the Integrated Agricultural Area's Programme (IAAP) and the Integrated Agricultural District's Programme (IADP) in specific regions of the country with given pre-conditions [Roy 1990 56-58] The culmination of the technological thrust was the 'green revolution' in 1965 This concentrated on regions such as Punjab west Uttar Pradesh, Haryana and Tamil Nadu and was based on high yielding variety of seeds for wheat and rice chemical fertilisers and controlled irrigation through tube wells The 'green revolution aroused economic and socio political anxieties in the context of an agrarian structure characterised by sharp inequality [Roy 1990 58 59]

The experience of this strategy reveals the ways in which the state, coupled with the market, can create the infrastructure and supporting institutions, to ensure that technology to increase farm productivity can be adopted and used profitably The state set up institutions which enabled agricultural research on technology-based farming and made provision of technology and credit, and price support for output The technologies carried critical implications for scale and divisibility of technology and agrarian relations Biological technologies such as seeds and chemical fertilisers were divisible. This was not the case with mechanical technologies like tube-wells but their using time was divisible Hence, in theory, the technologies could be adopted by any peasant irrespective of his farm size In practice, the large peasants tended to acquire technology both through the state institutions and the markets on more favourable terms than small peasants This enabled them to reinforce their dominance over marketed surplus and hence their power at the village level The evidence after the adoption of modern technology suggests very strongly that the small peasants were unable to retain their former advantage (in terms of having a higher productivity per acre than large peasants) with a breakdown and even a reversal of the pre-technology inverse farm size-productivity relationship Technology did not exist in a social and political vacuum but was appropriated by specific classes and used to intensify their class interests [Byres 1981 416] The 'green revolution gave rise to questions of inter-regional and inter-class equity [Roy 1990 59 121-24, Byres 1981 408-19]

The functioning of the state institutions and the markets for technology and inputs throws light on the role of formal and informal exchange relationships Case studies in western Uttar Pradesh show that allocation of credit and technology (e g, fertilisers) through state parastatals, and in particular co operatives, was governed by formal rules, regulations and procedures which were agreed by all the members In practice, however, three key findings emerged in the relationship between the state institutions and the peasants First, self-exclusion by some of the peasants arising from risk aversion led to the denial of institutional benefits Second, the formal stipulations demanded the fulfilment of security requirements, extending support to those who were in a strong economic position in the villages Third, the power relationship in the villages was mirrored in the capacity of the peasants to enforce their legitimate rights over their share of institutional credit and technology In consequence, the small peasants were unable to bargain as forcefully as the larger peasants [Roy 1990 152 57]

Peasants turned to the markets and engaged in informal forms of exchange to compensate or complement their requirements for technology and credit Allocation of scarce resources in perfect market conditions is based on the operation of demand and supply which establishes an equilibrium price But imperfections in the market can give rise to deviations from this principle, with non price factors influencing exchange Formal markets can be conceived as those which are sanctioned by the state, although it can try to intervene in the transactions Informal exchange took place over land, labour services, credit and technology These were interlocked and interdependent While such forms of exchange are not sanctioned by the state, but are a product of decisions made by individuals, the state can choose to intervene and redress the terms of exchange [Roy 1990 167]

Case studies reveal that the roots of some of these forms of exchange can be traced to colonial policies, emanating from pressures on the peasants to meet subsistence needs and rent revenue and tax demands of the colonial state Thus transactions emerged between peasants and suppliers of credit and technology (moneylenders traders) Peasants also entered into transactions among themselves The relative bargaining power of the different participants in the markets was mirrored in the terms and conditions of exchange over rates of interest quality and timing of credit and technology supplies Exchange relationships emerged over production credit and irrigation Colonial policies had given a sharp stimulus to such markets which enabled peasants to acquire finance to meet consumption needs The rent and revenue demands of the colonial state intensified dependency on such markets from the mid 19th century onwards The peasants had to meet their subsistence needs and fulfil colonial demands This brought about a rapid increase in indebtedness during the colonial era It was compounded by the withdrawal of taccavi or government credit which had been available previously Technology brought about an extension of exchange over credit there was a demand for production credit and cash was required to purchase irrigation fertilisers and labour services This was specially important for small peasants who were unable to take advantage of the credit institutions The state recognised the inability of small peasants of bargaining on equal terms under such forms of exchange but it was severely limited in redressing the terms of exchange if it did not simultaneously increase the supply of institutional credit Informal exchange over irrigation embraced relationships among the peasants themselves between those who owned tube wells and could therefore sell water and those did not own tube wells and had to purchase water from the owners when supplies from the canals, managed by the state failed to supply adequate water on time [Roy 1990 169] The pattern of tube well ownership was skewed towards the middle and large peasants and hence a significant proportion of small peasants were dependent on the latter for water Markets for fertilisers functioned alongside although the state intervened through selective controls (over price and quality of supplies) [Roy 1990 167 68] But there was often a breakdown of such markets because of the inability to ensure that the transactions conformed to state stipulations Peasants were often forced to pay prices above the controlled prices and to accept fertilisers which were adulterated

In both the state institutions the formal markets and the informal exchange relationships, the poor bargaining position of the small peasants stemmed primarily from their relatively vulnerable position in the village hierarchy Such processes had critical implications for strengthening the position of the middle and large peasants, who started competing for state power following the 'green revolution' under the political leadership of Charan Singh who hailed from Meerut Uttar Pradesh and whose rhetorics voiced the demands of all peasants with a call for greater provision of cheaper inputs credit, subsidies and price support The middle and large peasants started pressurising the state to tilt policies from the urban to the rural sector and demanded more favourable agricultural policies [Byres 1988(a) Roy 1990 179] In this context the virtues of collective action through pressure groups such as the Bharatiya Kisan Union which profess to further the interests of all farmers' need to be carefully assessed Analysis of protests by such unions for instance against low procurement prices may conceal class differences within farmers [Rudolph 1988]

Industrialisation and Liberalisation

The scope of NIE in the form for instance of collective pressures to challenge industrial and liberalisation policies has to be placed in the context of struggles between the major agricultural and industrial propertied classes over access to and use of state power and state policies

An analysis of industrialisation embraces interaction between the public and the private sector (state market interaction) and various forms of state intervention including regulating and mediating and creating the desired conditions under which markets can function Industrialisation occupied major interest for planners particularly from the Second Plan onwards It was closely tied to self reliance while imports of capital goods were to be reduced within a limited time span through domestic production which demanded access to natural resources India was well endowed with iron ore coal and other natural resources, and so could pursue industrial self reliance Import substitution industrialisation the main vehicle to bring about growth and self-reliance, was motivated by both economic and political factors The focus was inwards, inhibiting India s capacity to take advantage of the positive global conditions in the 1950s and 1960s, but the thrust was on building a strong and efficient industrial sector, with a capital goods base [Singer and Roy 1993 162] There has also been little appreciation of the impact of public works in agriculture infrastructure, education and finance and banking, on industrial development and policy [Baru 1995]

The Indian experience unfolds that while industrialisation progressed steadily up to the mid 1960s subsequently a falling rate of industrial growth set in from the mid-1960s onwards This was rooted in India's political economy

A number of groups during the 1930s and 1940s were concerned about industrial development and the role the state could play in it This included Indian businessmen economists and political leaders across the ideological spectrum Several factors contributed to this general interest in industrial policy with the role of the state ranging from the then perceived success of Soviet industrialisation to the lessons drawn from the Great Depression and the Keynesian anti slump interventionist policies [Baru 1995]

The foundation for industrialisation was laid by the Industrial Policy Statement (April 6 1948) This delineated the functions of the state and private enterprises including private foreign capital in Indian industrial development State control was divided into three broad categories First a division was made between sectors which were to be exclusive monopolies of the state Second new industries were to be under state ownership Third industries which were to be open to the private sector were identified Foreign capital was perceived as filling any deficiencies in indigenous industrial capacity As mentioned earlier the basic principles of initial industrial planning were embodied in the Industrial Policy Resolution (1956) Seventeen industries were listed (including public utilities) under exclusive state control i e Schedule A Twelve industries were to be progressively taken over by the state and were to be supported by the private sector i e Schedule B The rest was to be left to the private sector [Government of India Second Five-Year Plan (1956/57 1960/61) 125, Roy 1990 86-87, Chaudhury S 1984 10]

Pro interventionist and anti interventionist positions on Indian development have often tended to be ahistorical, leading to the view that the interests of the public and private sectors are always in opposition The 'crowding out' literature on public and private investment has been informed by such a conception On the contrary, at the time of independence and throughout the 1950s, public investment was seen as complementing or even fostering private investment and not restraining or 'crowding it out' [Baru 1995] In this respect, little attention has been given to the 'Bombay Plan', and in particular to Part 2, published in December 1944, which comprises a fascinating chapter titled 'The State and Economic Organisation' While rejecting state ownership or management on a wide basis, the document does not rule out state ownership altogether It accepts that in certain industries which are considered to be important for public welfare or security state ownership may be necessary for a long

and wealth taxes are somewhat limited" [Government of India, Sixth Five-Year Plan 27] Hence, the fiscal policies of the state have been intrinsically linked to Indian political economy and its ability to initiate and sustain growth [Roy 1995] The nature of the demand structure has also been a critical factor behind deceleration of industrialisation while the constraints upon agricultural growth have blocked the expansion of the home market for industrial goods [Rangarajan 1982 590 Patnaik 1985 8 Roy 1995]

LIBERALISATION

Liberalisation has unfolded the emergence of a new stronger contractual relationship which can be incorporated under the concept of NIE in the form of agreements and responsibilities between external agencies and the indigenous state [Tove 1993] In the Indian case this has taken the form of contracts between the state and the IMF Thus India's changing relationship with the IMF underpinned by the conditionalities laid down by the latter is expected to have a major influence in shaping free market policies For instance India's loan of $1 8 billion loan from the IMF led to uncertainty about the implications of such a transaction India's attempts to obtain a second loan unfolded the ways loans can be made conditional in relation to adopting domestic policies These have included deregulation of industry more encouragement to foreign investment liberalisation of foreign trade regimes major reform of public sector enterprises (including privatisation) and sweeping reforms of the financial sector [Roy 1995] The extent to which such policies will be accommodated is closely linked to the interests of the different industrial groups [1]

The thinking behind liberalisation the support and opposition it has given rise to among diverse interest groups and its impact on growth and development pose critical questions on some of the major concerns related to NIE In essence the shift to liberalisation has led to a re assessment of development goals and strategies This provides the context within which collective action through pressure groups to challenge any adverse effects of liberalisation, such as aggravation of poverty, can be assessed

The thrust on planning and state intervention dominated India's development strategies but since the early 1980s and especially the early 1990s neo liberalism has challenged this approach [Singer and Roy 1993 127] This cannot be divorced from the global context in which neo liberalism emerged and its critiques [Singer and Roy 1993 43 46]

Basically, liberalisation policies need to be placed in the context of competition for state resources among the propertied classes Thus competition between different types of industrialists has implications for supporting or opposing liberalisation opening up the economy and collaboration with foreign capital This is likely to manifest itself in various forms of political pressures on the state

Developments since liberalisation can be seen as product of the contradictions in the pursuit of growth along a capitalist path The use of deficit financing as a mechanism for implementing public investment has brought about a redistribution of income in favour of the propertied classes through inflation and transferring to these sections an incremental surplus in excess of the deficit This also carries implication for consumption demand and in turn investment Moreover the inability to transform agriculture has intensified the problems of falling growth Limits of the domestic market and the disproportionately high investible resources in the hands of the big industrialists have made the latter demand greater freedom within and outside the country The expansion of monopoly capital inside the country has been claimed to proceed at the expense of other capitalists and the state sector But in terms of the external sector it is likely to operate through collaboration with foreign capital [Patnaik 1985 8 13]

In the debate on liberalisation at one extreme some advocated that the only solution for India is complete globalisation of her economy making Indian industry confront world competition and attracting foreign capital to utilise her cheap labour for exports (*The Economist*, May 4 1991) Alas this overlooks the complexity of India's post colonial history discussed earlier and the socio political constraints inhibiting development

More sober critiques of Indian development have argued that liberalisation emerged because industrial development and diversification were not accompanied by a reduction in costs increase in productive efficiency or technological modernisation The thrust of the attack centred on controls over private enterprise which enabled bureaucratic officers and their political masters to have considerable discretionary powers leading to bribery and corruption inhibiting technological modernisation and increases in productive efficiency This had adverse consequences for the competitiveness of Indian industry within an international context, with limited export promotion [Rao 1988 4-5]

The political manifestations of liberalisation have taken various forms Business groups have tended to be major supporters particularly under Rajiv Gandhi's government But uncertainties have surfaced over the extent to which the economy should be opened up There have been differences in the interests of various groups within business such that those in import substitution industries have been less enthusiastic about liberalising imports compared with those producing for external markets Those from the more traditional business houses have feared competition from the newly established industries with new technology who may wish to compete internationally [Kohli 1989 316 17]

Established monopoly capitalists could favour selective liberalisation while opposing blanket proposals and in particular import liberalisation Import liberalisation for local production for the domestic market by multinational dominated firms may be acceptible to entrenched manufacturers provided it is at the expense of public sector units or small capitalists But any liberalisation which could threaten its own position would be opposed by them [Patnaik 1985 13] New houses may desire to break the monopoly position in the domestic market with the help of foreign capital and welcome the opening up of the economy in contrast to the traditional monopolist industrial classes with strong vested interests in protecting their domestic markets [Patnaik 1985 13]

As far as small scale industrialists are concerned the emphasis on export promotion has helped them They are emerging as the main exporters in India in comparison with the traditional big business groups to gain access to imported technology Such groups have become major supporters of liberalisation enabling the persistence of what has been coined a consumer goods led upper income groups oriented industrial growth strategy [Basu 1995] However the focus on export led growth needs to be related to changes in the global economy Doubts have been expressed about such policies specially under worsening global market conditions benefiting a limited number of products of a few individual manufacturers but the overall rate of growth is unlikely to be significant [Chakravarty 1987 73]

Moreover other groups such as members of the professions and the civil service have been treated favourably under liberalisation [Kohli 1989 318] These have emerged as being significant in terms of forming the section of the domestic market which formed the plank on which domestic demand was to be built The urban proprietary classes have been treated favourably They have been allowed to keep more income and to operate their business more favourably, compensating for the withdrawal of subsidies and protection [Kohli 1989 318, Rubin 1985 955]

Opposition to liberalisation policies has come primarily from sections of urban and

rural based classes, including the intelligentsia, industrial labour and rural and urban poor. Organisation of such groups against liberalisation could be one strategy to modify state policies. The rank and file of the Congress have expressed reservations about liberalisation. It has affected adversely support for Congress among the middle peasants and the rural poor of the scheduled castes. However, in the context of India's centre-state relationship it may be very difficult for those without a strong political base, including the semi-skilled and unskilled, to challenge the new policies.

In this respect, 'poverty alleviation' a major thrust of past development policies, has been absent from the rhetoric of liberalisation. Indeed, the emphasis of the policy on production and import of durable consumer goods and other goods aimed at the rich and upper middle classes is inegalitarian. While taxation has been eased for such classes in order to boost demand, the rural sector has been virtually ignored [Rao 1988: 8-10]. Reorganisation of industries carries critical implications for making workers redundant against a background of mounting secessionist and religious frictions. The state is having to cope with protests against liberalisation. Thousands of workers for instance were arrested in pre-emptive moves all over the country before their June 16 (1992) strike against liberalisation policies. Peaceful demonstrations against the latter organised by grass roots organisations have also been dealt with firmly [Kothari and Kothari 1993: 76]. Protests have also emerged in rural areas: thousands of workers were arrested in Uttar Pradesh following the withdrawal of fertiliser subsidies [*The Ecologist* November/December 1992]. Many ministers have become aware of the political costs they may be called upon to pay for any suffering emanating from the liberalisation programmes [*Economic and Political Weekly* 1992]. The policies also impinge on the capacity of the Indian state to cope with the increasing environmental problems which have short- and long-term implications for growth and poverty alleviation.

In essence, the Indian post colonial experience suggests that the role of policies such as NIE, including efficiency improving institutional change and collective action, cannot be divorced from the harsh economic, political and historical realities.

III
NIE and Development Process

A social dilemma emerges when radical individualism becomes inconsistent with social welfare such that the choices of rational individuals yield outcomes that are socially undesirable. NIE professes to resolve this problem by focusing on various types of allocative mechanisms ranging from property arrangements, private contracts, and communal action, to collective provision. NIE aims to bring about efficiency improving institutional change but collective decision-making is also emerging as a major school under NIE. Under efficiency improving institutional change reduction of transaction costs is critically important: contracts in transactions are related to ownership structures and property relations and 'getting prices right' only has the desired consequences when a set of property rights is in place to produce competitive markets. Under the collective action theory self interested individuals undertake action which benefits them collectively. This makes the relationship between interests groups and the state of paramount importance. Under both the role of the state has been acknowledged to be of key importance. This demands locating the analysis of NIE in the context of the relationship between the socio economic structure, the state and development.

The evidence of the role of the state in the development process in India highlights some key issues which need to be confronted in evaluating the relevance of NIE. The Indian experience exposes the myth of the neutral state and the prevalence of a highly differentiated socio economic structure at the micro (local) level. The two are interrelated in that in the post colonial period there has been a struggle between the major propertied classes over state power and state policies in agriculture, industry and liberalisation. This has major implications for the shaping and execution of development policies. Transactions at the rural level and state interventions in the rural sector illustrate the ways in which the existing property relations shaped by colonial and post colonial policies inhibited fulfilment of development goals. Hence improving the terms and conditions of transactions at the rural level such as over outputs and outputs demands uncovering the socio economic forces which may block set goals, and the scope of creating feasible organisations to overcome any obstacles. The theory of collective action to change any sectoral policies through interest based pressure groups has to recognise the presence of sharp socio-economic differences at the local level and the composition of the state in terms of the ways in which the dominant propertied classes may block any moves to bring about change in policies. Recognition of such concerns can help to further the analysis of NIE.

The Indian experience illustrates the urgency of examining the ways in which existing property rights may advance or inhibit the operation of formal or informal exchange relationships, and the role of institutions, which profess to cater for all interests. In the rural sector where non-market forms of exchange prevail, the transaction costs in relation to exchange over productive inputs, including land, labour and credit, may work against poor farmers, while state created institutions may favour the large farmers, markets, in spite of intervention by the state, may fail to conform to stipulations in relation to price and quality, both are likely to stem from the nature of the rural hierarchy and power relations, such that irrespective of provision of technology and credit through state institutions and informal forms of exchange, or markets, there may be bias against the small farmers, in the absence of a change in property relations in the rural sector.

The scope of collective action, under NIE, has to embrace the ways in which political organisation and the bargaining power of the rural and the urban poor can be strengthened through political parties, trade unions, grass roots organisations, and other forms of pressure groups. Such thrusts may support attempts to tilt economic policies towards the poor and ensure that 'safety nets' are created for the most deprived socio-economic classes under policies such as liberalisation. The Indian experience, however, suggests that evaluation of NIE in the development process has to confront the political economy of the state. In this respect the scope of the propertied classes of applying pressure on the state has critical implications for bringing about balanced development. Indeed the interests of the dominant proprietary classes including the industrialists, rich farmers and bureaucrats may constitute stumbling blocks in realising policy goals of balanced development and equitable distribution. For instance, competition between industrialists and large peasants may have major ramifications for access to state power and moulding state policies through farmers lobbies which may profess to cater for all farmers but in practice serve mainly the interests of the middle and rich rural classes.

In summary, to grasp more fully the relevance of NIE in the development process it is essential to critically evaluate the historical and political economy context within which it is being applied. Neoclassical institutional economists have emphasised efficiency improving institutional change through the reduction of transaction costs, placing much faith in the pricing mechanism being the driving force in resource allocation provided property rights are properly established. But there is a need to develop more fully the scope of the theory of collective action which has the potential to incorporate factors such as the sharply differing bargaining power of different socio-economic classes. Under both approaches the focus should

be on the extent to which the prevalence of a highly unequal socio-economic structure and a state dominated by the propertied classes, impinge on the capacity of temporary, or specific voluntary groups, to resolve short- or long-term developmental problems.

Notes

[This is a revised version of a paper titled "The State and Pressure Groups in Postcolonial India", presented at the Third World Economic History/Development Group conference on 'Public Choice Theories and Third World Experiences: The 'New Institutional Economics' and Third World Development', hosted by the London School of Economics (Department of Economic History and the Development Studies Institute), London, September 17-19, 1993. I am grateful to Nobel Laureate Douglas North, Robert Bates, Hans Singer and T V Sathyamurthy for discussion on issues related to the paper. My thanks also to Gareth Austin for stimulating my interest in the subject But I am solely responsible for any shortfalls of the paper.]

1 For a detailed discussion on the political economy of India's liberalisation policies see Roy (1995).

2 In this respect, the rise of non governmental organisations(NGOs), which claim to empower people to exercise control over livelihoods, may play a creative role by complementing, reforming or opposing the state. However, the NGOs reside within a system of unequal distribution of wealth and power See Thomas (1992) for a discussion of NGOs and empowerment.

Economic Reforms as Ideology

Romesh Diwan

This paper contends that the ongoing economic reforms' are a political ideology to shore up support for the use of power *of the ruling resident non Indians (RNI) To understand an ideology one has to understand the* power *behind it The existing power base is shifting from industrial to financial capital As* finance defines the power base, *it promotes the ideology that makes financial capital respectable and desirable The ruling RNI government knows well that these economic reforms define an ideology Since they always had control of government only minimal changes in the economy were needed Hence real functioning of the economy has not changed while its performance has become more depressing A positive change will need a paradigm shift of ideas Its underlying principle has to be integrative and not divisiveness*

THERE is a story in *Ramayan* Sita has been kidnapped by Ravana Rama and his followers are searching for her One of the search parties is made up of the soldiers in Sugriv's army They are talking about it One says that it is Dussreth's fault why did he make a promise to Kaikyi? Another says it is Rama's fault why did he go after the golden deer? Third says it is Laxman's fault why did he leave at Sita's request? Fourth says, it is Sita's own fault why did she leave the kutya? It goes on The interesting part of the story is that these soldiers find fault with every one except Ravan and none questions the act and immorality of his kidnapping! One finds similarities in the current debate about economic reforms in India

In the past four years whichever newspaper one picks up and whosoever one talks to one is confronted with the proposition that India has embarked on a desired path of economic reforms and liberalisation There is a virtual agreement that the government is doing the right thing and therefore deserves full support In the general media and among the average educated persons defined in terms of possession of university certificates there is little questioning about the reform and its direction Even the loyal opposition made of intellectuals of the left and Marxist persuasion has accepted the two paradigms One the past direction and policies of 40 years of economic activity in India was wrong if not wrong had at least serious problems Two the current priorities and policies under the rubric of economic reforms and liberalisation are in the right direction at least mostly The debate therefore is about technical issues such as the rates of deficit savings investment poverty reduction etc! This is not to say that there is no opposition whatsoever There are many economists experts and scholars who have questioned it but they have been mostly ignored!

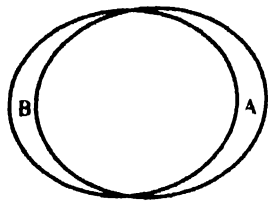
Yet there are a number of questions inviting to be asked Why these reforms? Why at this time? Why the euphoria about them? What is new in them? Are they needed? Who gains from them? Who is behind these reforms? These are important questions and have not been dealt with Yet these are the real ones that help us to go to the heart of the issue Before we can get to these questions let us look at the present day India and its society The Indian society may be divided into two groups the elite that forms around 1 to 5 per cent of the population and the rest (the poor) The elite society has a virtual control of all the political and economic power and is distinguished from the other group by its standard of living based on a large number of consumer durables access to political and educational facilities and language mostly English [Diwan 1993a] Given this Indian society our contention in this paper is that these economic reforms are neither economic' nor reforms' but instead a political ideology to shore up support for the use of power of the governing section of the ruling class of resident non Indians (RNI), the minuscule RNI minority in power I have expounded on the concept of RNI elsewhere basically RNI are defined in terms of acceptance of the superiority of the western rational thought and inferiority of the Indian culture! To maintain its privilege and power the RNI need an ideology Ideology it may be remembered is an important instrument of the use of power as well as for its maintenance One of the most important strategies to create and maintain power is to divide and rule Ideologies perform this function efficiently The question arises can economic reform be considered an ideology? if so what is an ideology?

On Ideology

Neoclassical or mainstream economics has become increasingly sterile by consistently rooting out reality It asserts that other schools of economic thought such as Marxian economics are an ideology It defines itself as scientific In fact it is not so Thurow puts it aptly "The equilibrium price auction view of the world is a traditional view with a history as old as that of economics itself the individual is asserted to be a maximising consumer or producer within free supply demand markets that establish an equilibrium price for any kind of goods and services This is an economics blessed with an intellectual consistency and one having implications that extend far beyond the realm of economic theory It is in short, also a political philosophy often becoming something approaching a religion" [Thurow 1983 (Vintage edition) xviii] Neoclassical economics is also not separate from politics either and is instead a camouflage for power as suggested by Galbraith "The separation of economics from politics and political motivation is a sterile thing It is also a cover for the reality of economic power and motivation And it is a prime source of misjudgment and error in economic policy [Galbraith 1987 299] If one looks at the concept of ideology one recognises how erroneous this view is

Webster's Ninth New Collegiate Dictionary defines an ideology as The integrated assertions theories, and aims that constitute a socio-political programme It needs to be noticed that the words chosen are assertions, theories and aims there is no reference to facts or realities What is implied here is that ideology requires some assertions The question is who can make assertions? Obviously those people who have the power to do so The underlying phenomena is power There is a group of people who have the power to appropriate a particular term, give it a meaning and assert its relevance, importance and even necessity Having done so this group can then devise socio political programmes that furthers its interests and ends For an ideology to exist and be effective, there are a number of necessary conditions

(1) A group has the requisite power, an understanding of its interests and a willingness to make assertion



(2) This group has the power and capacity, to wrap its interest into that of the larger group whom it is influencing even when its interests are inimical to that of the larger group It does so by concealing its interests and taking a high moral ground for the wrap It is a common practice in America and other European countries to exaggerate business interests into national interests" Other interests mostly of those of the majority, made up of labour, women, minorities etc, are regularly called as special interests

(3) It has the power and capacity, to develop and use images via rhetoric Rhetoric is rhetoric, pure and simple It is different from reality and sheer though concealed, propaganda Falsehoods are presented as truth and facts These days one is well conversant with commercials and the theory of advertising

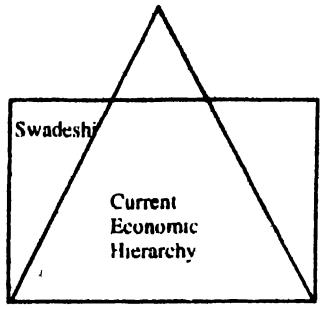
(4) It has control of institutions and has the means, to ensure that opposition can be

FIGURE 1: INDIAN ECONOMY – BEFORE AND AFTER LIBERALISATION

A Before Liberalisation
B After Liberalisation

trivialised If necessary it has the wherewithal to overpower any opposition

Some example will help to clarify these ideas Let us pick up some extreme cases, they explain the principles During Hitler's regime in Germany, the fascist ideas were fully accepted and acted on Intellectuals, writers journalists, newspaper editors, columnists etc articulated these ideas on a daily basis No one in the public questioned it, much less opposed it Part of the reason was that there were little mechanisms available for such questioning Owners and their henchmen editors of mass media would have found questioning unacceptable so that they would not provide the use of their space In case some questioning led to an opposition with some serious threat the power of the government was available to suppress it The fascist ideology therefore flourished It is common today to call Hitler a mad man yet such an idea would have been unheared of in those days It seems reasonable to assume that within the framework of that thought he, and his fellow Nazi colleagues believed that they were doing the right thing Similarly during the Marxist regimes in Soviet Union and Eastern Europe the power was in the hands of those who accepted Marxist ideology and developed socio-political programmes to promote it There was no questioning in the public media and no opposition The situation regarding the ideology was the same as in Nazi Germany though a little less extreme In 1990s the communists lost its power Its ideas are now pronounced as irrational by groups who think that their own ideas are rational



There are similarities in capitalist ideology It is known for centuries now that the object of capitalism is power and resulting privilege This power translates into profits prestige and personal pleasure greater the power larger the profits higher levels of perks and prestige, and more capacity for personal pleasures at the physical level The objective of the capitalist ideology is to promote profit making It involves exploiting and destroying communities by dividing them in order to cheapen the wages of labour In the words of Tawney, 75 years ago "Those to whom a leisure class is part of [illegible] without which civilisation is inconceivable, dare not admit even to themselves, that the world is poorer not richer, because of its existence So when as now it is important that productive energy should be fully used, they stamp and cry and write to the *Times* about the necessity for increased production, though all the time they themselves, their way of life and expenditures and their very existence as a leisure class, are among the causes why production is not increased In *all their economic plans they make one reservation, that however necessitous the world may be it shall support them* [Tawney 1920 136 emphasis added] More recently Galbraith makes the same argument "The ruling classes the privileged always look inward with approval upon themselves not outward in concern upon those whose anger and passion they may be arousing or could in the future arouse And this was so here Malthus and Ricardo were spokesmen for the new ruling class in a new economic order As would generations of economists to come, they spoke to and for their constituency They did not speak to those who, then or later might be encouraged to revolt [Galbraith 1987 87]

It is generally true that one's own ideology sounds rational while that of the opposition a propaganda There are also various shades of ideology some extreme and others less so yet these are ideologies all the same and have the same effect Though it is not generally accepted much less discussed there is in the US a prevalent ideology of capitalism a special brand of American capitalism with such buzz words as competition democracy and freedom A simple look at the US society reveals that most of the companies that brag about competition try every possible means to avoid and crush it The number of people voting for political offices has been continuously declining so that it is virtually half or less of the voting population "The argument shifts in terms of the existence of a two party system which in fact are two parties in rhetoric only" Similarly freedom exists only if one has the resources in terms of money Even though there is no real competition democracy and freedom in the US the ideology has given these words strong emotive appeal As a result these words have acquired moral tones and are fully accepted by the public to the point that many Americans will be willing to fight over these There is no questioning about it in the media and no opposition is possible It is not accidental that there is only one socialist congressman in the US This socialist congressman is there not because of his socialist ideology but in spite of it he happens to be a competent and a likeable representative

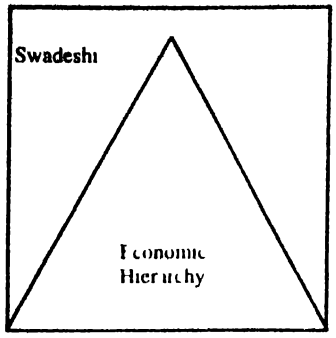
The capitalist ideology suits the US ruling elite superbly Of course, some may question the very existence of the ruling class in society even though its evidence is visible everywhere, in any corporation, office, media story In fact, this is a part of the ideology; deny the very existence of the group with its well-defined interests and entrenched power The ruling class and elite society in the US is well represented in its capital city Washington DC "To most Americans, the capital now seems oblivious to their life It has become like a fortress, more and more bloated and inefficient at a time when the rest of America has cut back and toiled to rebuild itself The capital supports a growing, well to-do elite of lobbyists, lawyers and other influence peddlers While America's middle class has suffered stagnant incomes and shrinking opportunity In an ominous number of ways in fact Washington has come to resemble the parasitic capital of a declining empire, following the imperial path of cities like Rome, Madrid and London If the past is any guide, the emergence of a rich and privileged capital city in America is part of a broader transition towards social and economic stratification towards walled-in communities and hardening class structure" [Phillips 1994 49] This ruling elite has defined its privileges through the business interests into national interest and has full control on the government and media to promote its privilege and ideology [11]

GROWING POWER OF FINANCE

To understand an ideology one has to understand the power behind it since in the last analysis ideology is an instrument both in the exercise of power and its furtherance There are two schools of thought about the source of ultimate power in western societies The first school is represented by Toffler who believes that the ultimate source of power particularly in the world of new techno-economic order [12] is knowledge and knowledge based technologies [13] In this view the source of power is shifting from muscle to money to mind This is however an analysis of the future shift in power and does not explain the present realities The second school has a lot of adherents who observe that the existing power base is shifting from industrial to financial capital There are adherents of this school from both the political left exemplified by Sweezy [Magdoff and Sweezy 1987] and from the right represented by Phillips who states "By the mid 1990s the bond market and the overall financial sector – had become a powerful usurper of control over economic policy previously exercised by Washington The new role of spectronic finance ranks with Washington interest-group power in helping to explain why politics cannot respond to people and why the nation's government and policies are so often ineffective financiers more often control politicians than vice versa" [Phillips 1954 52 53]

This is supported by the phenomenal size of, and growth in, the financial assets "From 1980 to 1992, the rate of growth of financial assets among the OECD countries outpaced the rate of growth of their real economies by better than two-to-one. McKinsey Global estimates. Daily bloodletting in the foreign exchange arena now exceeds trade in goods and services by an astounding fifty-to-one In nominal terms (correcting for volatile fluctuations in market prices), the total stock of the world's financial assets reached $ 35 trillion in 1992, and could reach $ 83 trillion by the end of this decade ($ 53 trillion in constant 1992 dollars) roughly three-times the projected GDPs of OECD countries for the year 2000" (*Z Magazine*, Vol 8, No 1, Jauary 1995.8). In view of the size and growth in financial assets, minor changes in interest rates have major impacts on the budgets of people and governments [14]

As finance defines the power base, it promotes the ideology that makes financial capital respectable and is considered most desirable. Accordingly, one hears more and more about the desirability and necessity of finance The telltales are everywhere The deficits of all types, such as budget, trade, revenue, etc, already fix limits to policy as well as their direction and desirability. Thus deficit reduction automatically becomes more desirable and important than helping people's education or providing food for the hungry The chairman of the Board of Governors of the Federal Reserve System is considered one of the most important jobs in the US even though there is no election for this position The companies that deal with securities and finance are gaining prestige and leadership status. The salaries offered by these companies are far above those in any other industry, in fact this is called 'the honey pot'. The US government bailed out a large number of financial companies, the notorious S and L, from bankruptcies; to the tune of half a trillion dollars and more. It is being argued that the difference between new and old democrat may be explained in terms of the shift away from people to money and finance.[15] Recently, a slight improvement in the economy, the stock market reacted negatively and many commentators argued in favour of the stability of the stock market. Inflation which affects stock markets most negatively is considered a far more serious problem than unemployment where only people suffer from long lines at soup kitchens There are news channels devoted specifically to finance; the stock market and all that goes with it The news about people's declining economic status, and hunger, is mentioned only around Christmas and Thanksgiving as a footnote to the glorification of millionaires [16]



Once one accepts the idea that the ruling supremacy in the US specially, and the western world generally is of finance capital, it is not difficult to recognise that institutions that take their cues from it will sing praises of finance capital. In the international economic scene, the two most relevant institutions are World Bank and International Monetary Fund (IMF); Bank and Fund for short Both these institutions believe in, operate on and promote this ideology All their policies are defined in terms of promoting the supremacy of finance capital Their lending to needy, and dependent, governments are based on 'conditionality' the basic purpose of which is to open the economy to finance capital

To practise the ideology, the Fund, according to one of the insiders, follows all sorts of shenanigans. The staff is required to operate so as to ensure that economic policies of third world countries satisfy a 'means test': namely, policies must meet the key criterion of improving economic conditions in western market economies. In general parlance, these policies must promote exploitation of the poor by the rich; both of countries and people Pax Atlantica demands that everything done by the Fund in the developing world be reduced to a common denominator of maintaining and increasing financial health in the first world; all else is incidental. To do so, IMF reduces all economic theory to Reaganomics and Chicago School monetarism A key indicator used extensively by the IMF is the index of relative unit of labour cost. It serves a key role in determining Fund conditionality. Fund is known to have 'manufactured' statistical indices that prove its point of view and allow it to push such desired policies. The Bank obliges and supports such fraudulent use of manufactured statistics. Furthermore, there is a clear, and identifiable, conflict of interest in the hiring practices of the Fund from the staff of the executive board; this is a form of insidious corruption. On top of it, the Fund-Bank staff suffers from a "sheer technical incompetence". These facts are documented by Budhoo, a long-term staff member of IMF who found the practices of IMF cost, from his high paid office. His resignation letter states, "I resigned from the staff of the International Monetary Fund after 12 years and after 1,000 days of official Fund work in the field, hawking your medicine and your bag of tricks to governments and to peoples in Latin America and the Caribbean and Africa. To me resignation is a priceless liberation, for with it I have taken the first big step to that place where I may hope to wash my hands of what in my mind is blood of millions of poor and starving people. Mr Camdessus, the blood is so much, you know it runs into rivers . sometime I feel there is not enough soap in the whole world to cleanse me from the things I did in your name and in the name of your predecessors and your official seal.. the charges I make are not light charges - they are charges that touch the very heart of western society and western morality and post-war inter-governmental institutionalism" [Budhoo 1990].

All elements and conditions of ideology are present here. There is a group of people in power who have a well-defined interest and idea which they have wrapped up in the form of a benefit to the needy and/or dependent governments. Thus the rhetoric is that these policies help the recipient countries. The facts are the opposite. For example, these policies have been responsible for low growth rates and a movement of financial capital from the poor receiving to the rich lending countries According to Taylor, "Growth rates of less developed countries are low because of scarce hard currency. developing countries sent $ 30 billion to $ 50 billion a year to developed ones for most of the last decade. A reversal of this poor-to-rich transfer is needed to restore per capita income growth. The Brady Plan is a bagatelle in this regard. Unless it is massively supplemented, the World Bank's optimism will be as misplaced in the 1990s as it was in Chile and Mexico in the 1980s" [Taylor 1991]. Bello and Cunningham (1994.67) suggest an astounding net transfer of financial resources from the third world to the commercial banks that amounted to $ 178 billion between 1984 and 1990."

Again these policies are not accepted or appreciated by the people in the recipient countries in whose name the policies are justified.[17] This is so because it has led to the impoverishment of the country and the people generally. A "global survey of the impact of adjustment over a 15-year period by the IMF reported the uncomfortable finding that "the growth rate is significantly reduced in programme countries relative to the change in non-programme countries" [Bello and Cunningham 1994:67]. As a result, "the number of people living in poverty [in Latin America] rose from 130 million in 1980 to 180 million at the beginning of the

FIGURE 3: SWADESHI AND ECONOMIC HIERARCHY

1990s' [ibid 68] Furthermore the debt has not reduced even though all these policies are supposed to reduce debt On the contrary the debt has actually increased Thus third world's debt burden rose from $ 785 billion at the beginning of the debt crisis [1982] to nearly $ 1 5 trillion in 1993 [ibid 67] In spite of such contrary facts, the idelogical propaganda continues They have the necessary means to promote it through a movement to what Budhoo calls Pax Honey Pot for its staff [18]

Positive Forms Normative Prescriptions

An ethical framework is not independent of the conceptual framework In fact for every conceptual framework there is particular and consistent ethical framework If one changes the conceptual framework it also implies a change in the ethical framework The scientific rational conceptual framework is a justification for the use of power and involves the domination of women and nature In fact that is why, and how the scientific rationalist framework emerged in the 17th century Market system and its related neoclassical involve economic exploitation and necessitate corruption and lack of character or personal integrity in an essential way In fact, corruption and lack of personal integrity are essential for making profits which in turn are the corner stone of a market system Economists and social scientists cover up this relationship between corruption and market system by creating an artificial distinction between normative and 'positive' statements Such distinction is neither logical nor factual Description and norms are not opposed to each other by linguistic separation into is and ought to statements but are contained within each other Language contains a culture within itself and its normative meanings become explicit only when alternatives or contradictions are presented A conceptual framework is consistent only with particular norms and values and not with others [19]

In a letter to his friend K S Krishnaswamy Ashok Mitra expresses a concern that the most staggering development is the corruption of our society, its values and their supplanting by moral and decency codes transmitted by the satellite television channels (Between Friends A Conversation *EPW*, October 22, 1994 2784) misses the relationship that conceptual framework of market ideology requires in an essential way in ethical framework of corruption, lack of integrity and of character The link between market ideology and corruption follows logically Market ideology imparts desirability to profits Profits follow from exploitation based on the use of power Power corrupts Those who can influence relevant legislation or regulation that helps them use their power make legal profits Mafioso types lacking the legalisation openly use their raw power directly Thus corporations raise prices by creating a monopoly through advertisements exempted from taxes 'pay lower wages to workers by encouraging governments to maintain high unemployment and transferring costs to any other groups they can by externalising Getting government officials political and bureaucratic to follow such policies for a small payment is a normal business expense and practice The evidence of such corruption is everywhere Italy Japan Mexico Nigeria the US How can India be different? Without corruption the market system even under the watchful eye of a Planning Commission will not function much less survive Need there be a surprise when Mitra in his second letter makes the statement I still remember the ecstatic praise the Fund-Bank pundits would shower on black marketeers throughout the 1950s and 1960s' (Between Friends *EPW* October 22 1994 2786) After all is not black market a market? What if the market is black? What is important is that it is a market Its blackness can be changed to whiteness by 'reforms' Non white Asian Indians have been changed to behave like whites in dress, language, table manners prejudices, etc Changing markets should be a comparatively easy task Are not the Bank Fund consistent in promoting these economic reforms? Is not the major objective of these 'economic reforms to whitewash?

Most economists of the right or the left have mistakenly accepted the fallacious idea that the ethical framework is independent of the conceptual framework Similarly they have accepted another equally fallacious idea that economy and society are independent of each other Textbooks in economics rarely talk about social problems such as poverty, arms race polluted environment, breakdown of the family, violence in streets and homes It is fashionable, for example, to find explanations of social problems everywhere else but in economic policy and institutions In fact, and interrelated so that most of the social problems emanate from, and get aggravated by the economic structure, ideas and policies that a country promotes Economic policies implied in the market ideology conceptual framework are destructive of all the sustainable functions in the society because economic policies justify and promote the use of power Such power affects all sorts of behaviour in the civil society [1]

Controlling imagery is highly important for mainstream economist's hidden objectives of transferring wealth from the poor to the rich because imagery plays a normative role and is related directly to changes in human attitudes and behaviour Images operate as ethical restraints or as ethical sanctions as subtle oughts and ought nots [Merchant 1980 4] Descriptive statements can and do presuppose the normative and thus are loaded with ethical contentions It is not accidental that neoclassical economics is full of hidden ideological and ought to arguments For example market economy produces goods not bads like pollution and crime competitive prices are efficient not exploitative even when soup kitchens and bread lines proliferate private business leads to progress and economic growth not unemployment and poverty development improves not degrades One can multiply these examples

It is worth examining the images and conceptual framework with its hidden but compelling and compulsive norms, the Bank-Fund have selected to promote its interests The terms they have picked up are structural adjustment programmes Saps for short' stabilisation liberalisation and economic and institutional reforms' The interesting thing about all these terms is that these are defined not because of any scientific merit or to convey an economic idea, but instead for their normative images and emotive appeal to desirability and general goodness Take the term, 'reform' According to *Webster's Ninth New Collegiate Dictionary*, it means, '1a to amend or improve by change of form or removal of faults or abuses, b to put or change into an improved form or condition, 2 to put an end to (an evil) by enforcing or introducing a better method or course of action" These are obviously desirable qualities, who in one's colonial, even rational, mind would go against reform Similarly, liberalisation connotes the goodness and desirability in 'liberating' implicitly from something constricting Similarly stabilisation conjures the image of stability from previous instability, a desirable action no doubt The weakest of these rhetoric terms is 'structural adjustment' Even this implies some sort of a desired activity since it leads to a needed adjustment Once these terms are added together, their collective form becomes a potent propaganda

suggesting something very desirable. Judged from their hidden agenda of transferring wealth from the developing to developed countries Bank-Fund policies are successful indeed.[23] On the other hand when one looks from their proclaimed objectives, there is strong evidence from many scholarly studies and even internal studies of World Bank itself that the Bank-Fund policies have not achieved publicly promised goals. On the contrary these policies have worsened the situation in the receiving country.[24]

Given this divergence, even contradiction, between formal and hidden objectives, the need for ideology and propaganda becomes all the more important. Therefore, the assertion, an important ingredient of ideology, goes further. Not only are these actions and policies desirable, it is further asserted that these are the only panacea for all economic ills. These are the only policies, for whatever economic problem. There are no alternatives. When alternatives are presented, these are summarily dismissed by various subterfuges. The propaganda has continued that these policies are necessary to resolve the economic problems of the dependent countries seeking their advice and help. This is consistent with Gobbles principle of propaganda; a lie told a hundred times becomes the truth. The business world employs this propaganda principle in the form of commercial advertisements.[25] In fact, this is the true test of an ideology; to assert it even when the evidence is contrary. After all reality and evidence are irrelevant to an ideology.

The media, both print and electronic, is the instrument through which such propaganda is carried on and ideology promoted. It does so by placing spins on partial fact to make falsehoods look like truth. In the US two magazines point out such spins. *LOOT* (*Lies of Our Times*) documents the way the *New York Times* slants the facts to promote the interests of the ruling class; selecting some stories and not printing others, adding uncalled for adjectives, missing some facts and emphasising others, selecting its sources for quotes and not speaking to people with other and inconvenient points of view, etc. *FAIR* (*Fairness and Accuracy in Reporting*) performs a similar function for the whole media; both print and electronic. It points both to biases and inaccuracies. The problem is that media is an integral part of the information industry and a business whose interests are well aligned with those of other businesses; providing honest information is least of its concerns.[26] It promotes the interests of those in power. If this involves falsifying facts, so be it. These are known as 'fake news'. The classical case is the atrocities, on Kuwaiti babies by Iraqi soldiers, literally manufactured in Hollywood type studio in California, made into headline news stories in the so-called objective US influential newspapers.[27] How did so many experienced, objective and highly paid journalists fall for such a falsehood and carry it further to promote the gulf war that resulted in a mass murder of so many people?

The Bank and Fund combined together have large financial resources so that they can easily influence the information industry to make their propaganda look respectable. Thus, "We may notice, in passing, some of the features of contemporary Newspeak. 'Economic efficiency' means profits for the few, crucially the foreign few, whatever the effect on the many. The concept 'economic health' is a technical notion designed to measure profitability for investors, while excluding the health of the economy as far as the population is concerned. Thus the economy can be wonderfully healthy while the people are starving."[28]

Economic Reform in India: An Ideology

The economic reform ideology arrived in India with the election of the Narasimha Rao government in 1991. Rao, himself, was a member of the Rajiv government and understood well the mechanisms for consolidating power. His minority government needed and recognised the usefulness of ideology to maintain and further its hold. To do so, it needed support from other quarters. Being interested in power at any cost. He had no difficulty in looking for it outside the country; particularly if it involved cheapening labour price[29] and selling it abroad. Support from outside was available at a price; opening up the country for exploitation so that wealth can be transferred to the developed countries. Willing as he was to pay any price, he had no difficulty in accepting IMF 'conditionality' in exchange. He appointed a finance minister from its erstwhile bureaucracy who could make necessary deals with the IMF-Fund for its support.[30] With foreign support thus ensured, it needed the help of some business houses which was not difficult to get in view of the largesse that a government, even one, specially one, that talks of privatisation, can deliver. The core of the power group was formed. Given the nature of the support from outside and within, there was another price to be paid; a steep rise in corruption and corrupt practices. This was, however, least of Rao's concern. All that remained to be done was to wrap up the interest of this core in the name of the welfare of the country for rhetoric purposes. *Viola*, the necessary ingredients for the ideology were all in place and the ideology of economic reforms was launched with proper fanfare.

The first element in the strategy to devise an ideology of economic reforms was to assert an artificial break between the time this government started in 1991 and the rest of the period since India's independence in 1947. The argument was made that all those 43 years were a wasteland of economic policy. It never occurred to the rulers and the idea was never questioned by 'the bought priesthood' of respectable columnists, journalists and other so-called intellectuals that both the prime minister and finance minister – and others – have been full participants in the formulation and implementation of the now denounced policy. In fact the prime minister belonged to the cabinet that formulated and implemented that policy. It is interesting that these people do not realise that assertion of such an artificial break implies denouncing not only their own past involvement but more so their own leaders; leaders whom they need, and show in life-size posters, during elections. In an ideology such questions are not asked since these deal with both rationality and reality. The subservient media and columnists obliged by talking about its praises instead of raising questions; they generally do.

In addition to the denouncement of the earlier period, it was asserted that the new policy is a panacea and will solve every economic problem: growth, employment, inflation, poverty, deficits in trade, revenue and budget – or any other one can devise. To give it an aura of a panacea, it was presented as a technical exercise, alluding that if it is technical it must be comprehensive. It was also hinted that there were no political overtones. Obviously, the facts are that the policy is neither apolitical nor a panacea. It cannot be. A simple analysis should convince any one who cares to think. On the contrary, it is highly partisan and political. Far from a panacea, it has heavy costs and a large amount of negative trade offs: low rates of growth, increases in unemployment, poverty, inflationary pressures on goods consumed by the majority, etc. The costs are borne by the weak and the misguided. The weak are the poor who always suffer. The misguided have been political parties not only left-oriented but also nationalist ones.

To promote the ideology further, it was asserted that it has the support of IMF and World Bank. No body asked that these policies have failed miserably, and regularly in so many other countries in the world. Why should they succeed in India? It is hinted that the very fact that IMF and World Bank supported it is a proof that the reforms must be the right one. This argument, though erroneous, appeals to a large number of RNI elite and their intellectuals in view of the fact that they have bought wholesale the superiority of the western institutions;[31] the ruling class's "servility – to government, to custom, [especially] to the developed 'white' world, to a host of other forces considered superior". This servility is not a creation of these few years. The ruling RNI society been promoting such servitude all these 50 years.[32] In fact it lies deep in not only colonial ideology and what Albert Memi calls,

colonial minds, but in the very acceptance of the western rational thought whose major objective is to describe, explain and justify exploitation as well as rape of nature women and the colonised people by those in power It condemns and marginalises all thought and ideas based on principles of whole unity organic by denouncing them inferior to scientific ideas that proceed from parts It implied the principle of divide and rule Since Gandhi's death the power structure in India controlled by RNI has been condemning everything Indian its civilisation its values its heritage its dress its food its rituals etc The westernised Indian, proud of his/her rational attitudes, has simply adopted the prejudices of the colonial white male except when it contradicts one's own ego This too has been successful in achieving its objectives Should it surprise any one that the natural consequence of these kinds is to damn the very Hinduness and Indianness including the Indian person? Why should any one respect or trust an Indian expert? Does it not contain the adjective Indian which is an automatic denunciation? When Krishnaswamy writes As you know what we say has little value unless it is confirmed by some white man he misses the history of Indian colonialism and its continuance in the last 5 decades This colonial attitudes has been particularly helpful in promoting this ideology

In its initial stages it was asserted that all economists supported it Here again there was a hint that it has the support of so called experts The fact is that most micro economists are no great experts and these days they are not even respected as experts [9] Moreover those who opposed, and there were many were ignored and not counted The so called objective English medium media did not care to report about them much less question the assertions This is a standard form of ideology Opposition is disregarded and then denied

Another form of assertion and a part of strategy is to make the arguments tautological and future related There is thus no way to evaluate the success or failure of the reform or stabilisation The success is asserted by the sheer delineating of economic policy Thus, if the budget follows IMF guidelines and gets its approval it is asserted as successful Again if it states that taxes be reduced, the very act of tax reduction is asserted as success of the policy and therefore of economic reform What happens after the tax cuts is irrelevant and need not be questioned Bhagwati and Srinivasan are quite explicit about the nature of these reforms as an ideology They do not mince words It is instructive to quote them "The government needs to educate the public continually about the foregoing misunderstandings and every important minister of the cabinet and every available occasion must be exploited to do this and thus to put the rationale and importance of the reforms before the public If this is not done the reforms are likely to lose support as misunderstanding multiply and acquire cogency simply because no coherent rationale and defence of the reforms is available the efficiency oriented reforms were often misinterpreted as yuppie yearnings out of tune with India's poverty needs when in fact they could have been explained as truly anti-poverty measures This will enhance the credibility of reforms The credibility of the reforms is necessary" [10] Note nowhere is it suggested that the data on its success be presented to persuade people about the desirability of these reforms Instead the advice is to make assertions as many times as possible is it not a page from the advertiser's manual? a la Gobbles propaganda principle a lie told hundred times becomes truth For example the reform promoting economists have suggested that growth reduces poverty

The facts contradict this argument In the case of the U S for example the economy had roughly the same rate of growth of output and inflation in the expansionary phases of 1963 69 and 1983 89 yet poverty rate declined by 7 4 per cent in the 1960s compared to 2 4 per cent in 1980s In other words the capacity of economic growth to reduce poverty rate declined This is partly due to the nature of growth in 1980s wages remained constant even declined while incomes in the top range grew much faster The trickle down does not always work The moral of the story is that growth by itself is not enough for poverty reduction much depends upon the composition of the growth process [Cutler and Katz 1991] Such evidence would nullify any ideology and is thus never sought The argument about growth reducing poverty is presented as an assertion Furthermore tautological arguments are made that one needs more of the same even against contrary evidence

To quote again Indeed in the absence of further new steps the returns from the existing reforms may be meagre in terms of productivity and export increases in particular encouraging critics of the reform to accuse the reformers plausibly about being in error when they argued for their necessity [Bhagwati and Srinivasan 1993 7] Could this argument not be made in favour of any policy? If so what is so special about this policy? How then can the old, denounced policy be wrong? The difference is those who are making these assertions have the power to do so

The ruling RNI in the government and its allies, both within and outside India fully understand that these economic reforms define an ideology to maintain and further their hold on government and financial resource. Since they always had the control they needed minimal changes in the economy to benefit their own and their new partner's interests Accordingly the functioning of the economy has not changed fundamentally as illustrated in Figure 1

The pace of change initiated over the last two decades has maintained Most of the change is in rhetoric it is well expressed in the commoh comment, "the regulations have gone but not the regulators" However, the policy has succeeded in its major objective of gaining greater control of the government insofar as the opposition, of all sorts, has been taken in by the rhetoric or muffled The media continues to sing praises of the reforms What is happening around us is both bizarre and depressing The country is currently the victim of a fantastic confidence trick Apart from other things the media have been so completely subverted that it is difficult to get one word of protest or dissidence even sideways (Between Friends *EPW* October 1994)

The *Economic and Political Weekly* and those who write in it have analysed the four budgets and the numbers released by the government agencies *ad infinitum* The numbers tell a story of at best a very poor grade if not a dismal failure something with which no policy maker can feel comfortable with much less be proud of This should not be surprising It is after all a trickle down spread a little around fiddle with the middle type economic policy Experience of other countries has also been similar Recently there has been a serious financial crisis in Mexico and the general media that wrote glowingly about economic reforms there has started telling some truth "The [economic] reforms enthusiastically supported by Washington and many wealthy people here benefited few Mexicans before the current crisis began on December 20 and fewer still afterward We are all leftovers of a political system that creates a few super-millionaires and millions of super-poor", said a statement released last week by the Zapatista National Liberation Army the peasant group that took up arms against the government in the southernmost state of Chiapas 13 months ago Mexico's foreign reserves, which stood at $ 28 billion a year ago, have dwindled to a little more than $ 3 5 billion, according to the country's central bank, the Bank of Mexico" [16]

Whatever meaningful numbers one looks at one is astounded by the dismal state of Indian economy The growth rate of the GNP has been below even the Hindu rate, much less the high rates of growth achieved in 1980s which are being branded as a failure of economic policy In spite of sustained agricultural production due to good rains and harvests and the likelihood that the buffer stocks of foodgrains could touch 40 million tons in 1994, per capita foodgrains availability

had declined from 310 grams per day in 1991 to 465 grams in 1993. The low growth rate has resulted from a serious slump in industrial production, and this slump has continued for the past three years. The level of employment has gone down adding pressures to the lowering of the wage rate. The inflation rate has hovered around double digit in spite of ample food stocks and large imports of wage goods. The prices of food commodities have grown faster so that the number of poor has been going up. As regards the potential for growth, saving and investment have declined steadily, savings from 24.6 per cent of GDP in 1989-90 to 22.3 per cent in 1992-93 and fixed capital formation from 21.7 to 19.6 during the same period. This does not augur well for economic growth. This dismal performance of the economy has effected even the central budget which faces rises in both revenue and budget deficit. These numbers however deal with the real economy and affect average people in the country but not those who hold the power and whose interests the reforms serve.

The Indian economy is now in a debt trap. India imports on the average goods worth $25 billion and exports in the best of circumstances around $20 billion. In the past few years the import situation has been helped by two major factors (i) a slump in the industrial economy so that its imports needs were reduced and (ii) a major reduction in the price of oil. These favourable circumstances cannot continue. There is thus a structural imbalance of around $5 billion. Add to it the interest rate payments on the foreign debt around 10 billion dollars per year and growing over time. There is thus a structural imbalance of around $15 billion. This is the size of the debt trap.

For purposes of rhetoric the government can and does keep on harping that the foreign reserves have been going up. Even here the story is not that bright. The country's external debt rose from Rs 1 302.8 billion to Rs 2 809.8 billion between 1989-90 and 1992-93 jumping from 28.5 per cent of GDP to 39.9 per cent. The total debt servicing charges in 1992-93 amounted to 30.8 per cent of current receipts and accounted for 44 per cent of exports. In a diagram it is stated during the first half of the current fiscal year (April-December 1994) against gross aid receipts of Rs 3 803 crore Rs 2 741 crore (72 per cent) flowed back by way of amortisation and another Rs 2 233 crore (59 per cent) towards interest payments. This resulted in a net outflow of Rs 1,171 crore (31 per cent)."[7] The foreign debt which is other side of the ledger is rarely mentioned. "Virtually all of the additions to foreign exchange reserves accrued through new IMF loans, NRI deposits, and further commercial borrowings."[8] Last year exports did a little better and the balance of trade had a smaller deficit partly because of the recession in industrial sector and thus small the imports. And the media went gaga over it. If one goes deeper into trade data, these are temporary gains which did not continue even next year. "Exports in dollar terms rose by 13.9 per cent during April-October 1994 and imports by 19.8 per cent non POL imports went up by 30.6 per cent. Considering the economy's import propensity this is not surprising nor is the widening of the trade deficit to over $1.4 billion from $569 million in the same period of last year." (Current Statistics, *EPW* December 10, 1994, p 3114).

The country has been opened up in the name of globalisation and liberalisation but basically in exchange for the political support of international including NRI capital. The foreign resources that have flown in have gravitated towards mostly speculative rather than productive investment. "We have yet to find evidence that the level of private investment in the economy has gained the level attained in 1990-91." [Balakrishnan 1994: 980] i.e. prior to the economic reforms and all the concessions and giveaways to the private capital foreign as well as domestic. It is estimated that virtually 70 to 80 per cent of direct foreign capital flows have been in financial form speculative purchase of assets of public companies being sold and land deals.

Poverty has grown both in size and severity. According to the latest 27th edition of *World Bank Atlas* India is the one of the 11 poorest of the poor countries in the world as measured by its GNP of $290 per capita. It is one of the three such countries in Asia other two are Bangladesh and Laos. Remaining eight are African countries.[9] The social problems have aggravated further. A perception has emerged that liberalisation of economic policy perhaps has become liberalisation of corruption. And this from Arjun Singh's letter of resignation to prime minister Narasimha Rao (quoted in *Blitz*, December 31, 1994). This is a very telling statement about corruption because one senior minister of the government not known for integrity is publicly writing about it to the prime minister. It has made life harder for the common person. This is clear even from random examples. The use of alcohol is growing so that it is now a large market and more people are dying on the roads.[4]

One may ask the question if the performance of the economy is so dismal why are economic reforms still being touted in public through a media blitz? The reasons are political. The ruling RNI elite has no reason to expect any better performance. It has guarded itself by its tautological reasoning and its support among key groups that wield power. Perhaps there is a need to rephrase the question. Given such poor performance, why have not the political parties in opposition not punctured this ideological balloon? There are two types of opposition parties, it is instructive to analyse their response to the ideology of economic reforms:

(1) The left-oriented parties, the Marxist, the Janata Dal and other similar groupings in different states. These are made up of RNI, the loyal opposition, their arguments and concerns are best represented in the pages of *Economic and Political Weekly*. It has lost the intellectual moorings of its *raison d'etre* after the demise of Soviet Union and has been seeking some form of legitimacy. Also, it has generally accepted the basic proposition of the superiority of the western rational thought. Given these two proclivities it accepted the proposition that planning was a failure and some form of reform is needed. They have thus taken the rhetoric seriously and concentrated their efforts in analysing the performance of the economy rather than opposing reforms ideologically. For example, *EPW* Research Foundation (1994) has analysed why have the reforms failed. The implication of such studies is that reforms are needed but need to be formulated differently. They have not recognised that economic reform is an ideology[41] and that ideologies are fought at the level of an ideology and not at the technical level. At present they do not have an ideology. Accordingly these groups have been ineffective in dealing with the reform ideology. In fact given the loss of their legitimacy their acceptance of western rational ideas that promote divisiveness and continuous splits in the various groups representing their changing power relations these left parties accentuate mostly negative and divisive policies. Because of their belief or need for concerns that promote divisiveness these parties may be of little relevance to India's future.

(2) There is the opposition represented by the nationalist BJP party. The BJP distinguishes itself on the basis of its concern for Bharat its heritage and civilisation. It has thus an access to high quality ideology. Accordingly the BJP had a good chance to expose the bankruptcy of the reform ideology by fighting it with a better more substantial and counter ideology of swadeshi. Figures 2 and 3 illustrate a distinction between swadeshi and the existing economy. The triangle represents the existing economy whose base is made up of poor and informal sector and whose vortex represents the rich and powerful. It is of the shape of a pyramid few rich at the top and most poor at the bottom. By comparison, the swadeshi society represents a square where the size of the base is not different from that the top. In the current situation, represented by Figure 2, economic reforms accentuate the inequalities so that a part of the triangle is above the square.

The reason why swadeshi society is represented by a square with the same base is because swadeshi has all the desired

qualifications.[42] It has an appeal to majority population, even a small part of the ruling RNI elite. It combats the realities resulting from business and bureaucratic corruption on the one hand and gross inefficiencies of the market system on the other. It has a commitment to move the economy and industry at a higher level of productivity and technical competence. In its initial stages, swadeshi has the advantage of promoting both economic growth and employment thereby reducing poverty. Swadeshi thus contains most of whatever little substance there is in these 'reforms'. By accepting reform ideology even partly, and not promoting the swadeshi alternative, BJP made a mistake. BJP's support provided important legitimacy to the reform ideology, helping the Rao government in its control while hurting BJP itself. As a result, BJP has lost a great deal. Not only has it missed valuable time but has also suffered in the elections. For BJP, it has been an expansive mistake. Its mistake has also cost the country and the poor a great deal.

Political Fallout

We have argued that economic reforms in India is an ideology for the sole purpose of maintaining and promoting the interests of the group in power. The group in power is made up of ruling RNI elite, its allies among NRI and foreign capital, and the trading houses that have been gaining economic power and resources in this alliance. During this period whatever little growth has taken place has helped this group; (i) foreign capital in terms of cheap labour, Indian assets, and speculative profits, and (ii) domestic finance capital in the form of speculation, exports and bank profits, etc. This alliance has helped the government to maintain its hold. The question is: how long can this ideology of economic reform be able to generate the rents and royalties to this alliance?

If this analysis is valid, it suggests that the ideology cannot succeed long without some visible economic performance. The problem with ideologies is that they disintegrate when questioned and tested against reality. Truth emerges and reality catches up. There are two factors which will lead to a disintegration of this ideology: One, the alliance may break down. Already, IMF and World Bank have been looking on the other side as the central budget keeps on flaunting the desired targets. There is a limit to this process. At that point there is a possible conflict between domestic and foreign capital which is bound to come to the fore.

Second, if the economic performance remains as dismal as it has been, and there is no reason to expect it will improve in the near future, even the gullible journalists and intellectuals will find out that it is all rhetoric. On the contrary, the economic situation is liable to get worse.[43] All analysis suggests that there is neither growth nor stability in the current budget; the constraints of the budget making are becoming more serious. The advantage of the six good monsoons has already disappeared this year. With declining investment in agriculture, this sector may pose a grave threat to the government. The payment of interest on foreign debt is coming due and will add a pressure on the trade deficit.

The Indian political process follows democratic principles via regular elections. Since these reforms are at the expense of the majority poor and disadvantaged, they will respond at the election time. Populism has remained and still remains a political force. Elections, unless manipulated as, for example, in Mexico, invariably go against such reforms. There is a lot of evidence on this proposition from all over the world. This happened in India as well. Four state elections took place in November 1994. The winning parties made the basic principle of providing economic improvements to the masses through the reduction of the price of wage goods, a policy completely opposed to 'economic reforms', a part of their election agenda. The ruling Congress suffered a defeat in all states, even in Andhra Pradesh from where the prime minister hails and where he made all sorts of speeches and spent lots of money. Jayashree Sengupta has articulated these election results with a flourish. "The trouble with people in power in New Delhi is that they, like 'badshahs' before them, become isolated from the people, particularly the poor. They keep meeting their own types at posh hotels and get together, exchanging mutually pleasing pictures of what they are doing and seeing. A sprinkling of foreigners always provides the right backdrop of encouragement because they are there to say how great India will be if only it liberalised faster... People had become impatient and the signs were visible. If only these policy-makers looked around them from the curtained windows of their bullet-proof cars and saw the hungry and often angry faces on the roadside... Even the stodgy senior bureaucrat with his wings clipped, admitted the value of economic reforms. Not they, but their children were working in either some multinational subsidiary or a foreign bank and drawing their annual salary in a month's time... The favourable report cards from the World Bank, and the IMF gave the impression to the people that everything was going rather well. The media was convinced too. Reports from seminars, workshops garnished with famous economists, appeared in major newspapers and journals saying the same thing. ...People became designer-minded and brand-conscious. Indeed, India was going global, said the elite crowd in the metro cities but no one realised that they were only a minuscule percentage of the 900 millions. [illegible] Boiling Masses Speak', *Observer*, New Delhi edition, December 14, 1994). The media has tried, and is continuously trying, to make the argument that these elections were not against reforms but instead depended on local issues. This goes against both reason and reality.[44] Four more states are going through elections (February 1995). The results would be out in a few weeks. Already some recognition is being accorded to the fact that reforms may not win votes. There is a possibility that the ruling Congress Party, the promoter of 'economic reforms' may lose all important states. Still the ideological propaganda by the media continues.[45] Eventually, it delegitimises them and their future capacity to promote the fantasy and illusions of economic reforms.

A Prognosis

We have argued that economic principles, social institutions and ethical norms together make a consistent framework. We have also argued that 'economic reforms' are based on exploitation of the larger society and environment in order to serve the interests of the ruling NRI and international capital. Because of such inter-relatedness and their exploitative nature, the current 'economic reforms' are bound to place great stress on the Indian society to possibly a breaking point. In this sense both AM and Krishnaswamy are right in reaching the conclusion that this can lead to a "bloody and anarchic" change ('Between Friends...', *EPW*, October 22, 1994). Their hope is that such a change will follow from the current 'irrationality' of the system and will be led by the poor masses; not intellectuals. Unfortunately, history does not provide many examples, much less an assurance, that the 'collapse of irrationality' will come about by the uprise of the oppressed; however logical and rational it may sound. Even if such a change takes place, it can, and will, introduce its own 'irrationality' because this whole 'rationality' is based on divisiveness.

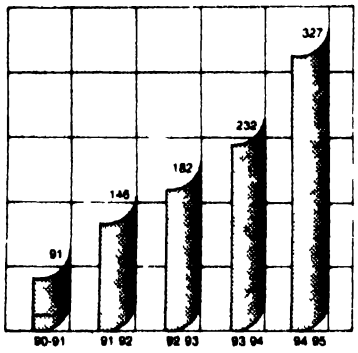
A positive change will need a paradigm shift of ideas; a different conceptual framework with its consistent ethical framework. Its underlying principle has to be integrative and not divisiveness. The ethical framework is clear, it is one where personal integrity, quality of personal character and commitment to public good at a high personal cost are not only honourable values in themselves but also considered honourable and desirable by the society. It is also clear that these ethical values are not consistent with the conceptual framework of planning, market ideology and 'economic reforms'. The conceptual framework that is needed, then, is the one based on organic and holistic ideas.[46] It is a framework that promotes, not destroys, sustainable

functions of man, woman, family and nature It is a framework that assigns a higher image to humans than merely physical beings who can be satisfied by material goods so that progress is not measured only by the multiplication of material possessions and increases in physical comforts "The physical approach to life has become a kind of epidemic in modern industrial civilisation Never in the history to my knowledge, has a civilisation reflected a lower image of the human being a physical chemical organism with no motivation than self-interest, no aspirations that cannot be fulfilled on the physical level Believing that the human being is physical, we have by some three centuries of concentrated effort developed the technology to do what we like in the physical world We have an unprecedented capacity to pursue material goals and produce material goods to satisfy every desire If the physical image of man is accurate we in the US must be living in the Golden Age [47]

It is a framework that promotes well being of humans and nature and not their exploitation nor the exercise of power Since human welfare is not possible without community of which family is the basic unit it is a framework that exalts, strengthens and stabilises family neighbourhood mohalla and village This concept is very different from that of employment which promotes individualism What is needed therefore is not full employment but community growth Family not the individual has to be at the centre and litmus test of all economic and social policy Thus every activity and institution that weakensess the family has to be taxed heavily Similarly every activity and institution that promotes the cohesiveness of family and community has to be subsidised It is such a paradigm shift that some of the *avante garde* thinkers are working on It was this paradigm shift that Gandhiji had articulated in his immense wisdom He developed a part of the framework in the concept of swadeshi [48] It is in this paradigm shift and Gandhian paradigm alone lies the hope for the Indian society though not for the 'reform led Indian economy as we understand it today Once swadeshi policy is in operative it will impact the whole society not only the people at the top The final outcome of such a policy is illustrated in Figure 3 where the triangle represents the economic hierarchy as in the current economic situation and the square the swadeshi society Many will, no doubt question its validity partly because of lack of familiarity with such a society but more so because such a society will not be able to provide the privileges to those who are in power at present Since it is these people who control the media this alternative will be misrepresented In fact, a controlled media is always denied the legitimacy of an alternative, any alternative, particularly an alternative which is serious and workable

The question is will such a positive change come about If yes, how? For such an alternative to emerge, it is necessary that there is a shift in the paradigm of ideas and thought At present, both the paradigms are reflected in the political parties (1) The Congress and its leftist opposition in the form of Marxist and Janata Dal type parties represent the western rational paradigm Their intellectual paradigm is based on power and its corollary of exploitation Accordingly they need to divide the people in whose name they want to gain power Thus Congress has been dividing through the mechanisms of minority vote The present Congress government is losing its popularity The divisions within itself are getting deep It may be too early to write its obituary the ownership of government that has kept it alive is now weakened, the business people who have provided them the money and muscle have no commitment to it and can easily move to other groups Marxists divide because they cannot stand anything that smells of the majority Hindus or its heritage It is not accidental that Marxism, in spite of its theoretical appeal to the large majority has remained a minor player in the Indian body politic Janata Dal divides to gain the votes of the scheduled castes and dalits Its problem is that it has none of its own coherent and positive policy or programme It has always been made up of people who left the Congress for one reason or the other and has never developed into a full-pledged party A part of the reason lies in its need to divide and depend upon different groups who themselves are not part of a larger group It is, therefore, an inherently short-term and local phenomena

(2) The second paradigm based on integrative principles is represented by the BJP Because of this paradigm it poses the most serious threat, not only to the government at present, but to most of the assimilated RNI both ruling and loyal opposition That it has been a serious threat to the RNI can be judged from the fact that right from the beginning, as early as mid 1970s, when it was too small to be taken seriously, the media started the campaign to denounce it by affixing a pejorative adjective to it, rightist reactionary' Hindu party In those days rightist and 'reactionary' were pejorative term terms that have gained respectability these days It is interesting and instructive to note that these adjectives are no more affixed to the BJP Instead it is now called 'fundamentalist Hindu' party, it does not bother these self-styled objective journalists that 'Hindu' and 'fundamentalist' are contradictory terms [Frawley 1991 1992] The objective is to give it a bad name in the hope it will stick Not only have these pejorative terms not stuck, but instead the BJP has gained popularity and strength by the year, in spite of, and against, the heavy odds of a ruling class organised against it. Such attacks on the BJP continue Take the example about a report regarding the elections [February 1995] in Maharashtra where it is suggested that the Congress may lose "We are familiar with the Congress Party's functioning especially with chief minister Sharad Pawar" said a top Bombay industrialist, who did not want to be identified Foreign investors are concerned about the possibility of the BJP taking charge [of Maharashtra State Government] rather than the Shiv Sena, said a senior executive of leading multinational management consultancy firm operating here [Bombay] 'The Shiv Sena is largely seen as a malleable party but the BJP is rigid It is they who, our clients feel, may cause a problem" [*India Abroad* February 17, 1995] It is interesting to analyse this statement (i) Basically, it says that the Bombay industrialists like Sharad Pawar because they are corrupt to the core and corruption is OK (ii) Shiv Sena is corruptible and therefore OK (iii) BJP is not corruptible and may follow policies that may not allow the rich to exploit the poor and the country for their gain the policies based on the alternative paradigm They are thus not acceptable



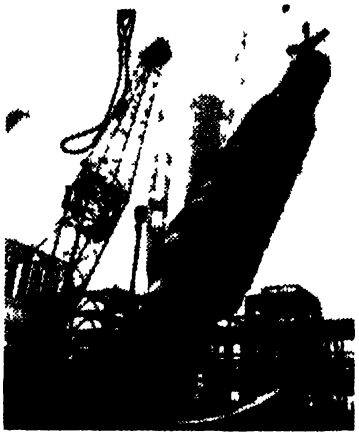
The BJP is emerging as a national party with its support virtually in all the major states The threat that the BJP poses is so serious that all other parties are joining together with one single object, to keep it out of power In addition, there are problems within the BJP With its growth, it has also attracted many RNIs who are interested in their personal power and have little understanding or commitment of its principles and the different paradigm Their presence helps the ruling RNI to manipulate the party, particularly its programme and policies It helps the media to confuse the public by misrepresenting the BJP as no different from other parties The BJP has already made the mistake of supporting the ideology of economic reform thereby hurting itself and its message One assumes that the BJP has learnt its lesson the hard way and is not liable to repeat its mistakes Given the opposition from all political parties the media particularly the English language media, and its internal problems the BJP has a long way to go to gain political power It is still in the process of formulating, and articulating the alternative swadeshi programme and has to deal with a media bent on seriously misrepresenting this alternative It will thus take quite a long time for the policies based on this alternative to become operative

The prospects in the near future are full of uncertainty The Congress Party is now faction-ridden With the lack of power through the state governments, these factions

Accelerating Growth

Excellent Performance 1994-95

Net profit Rs. 277 crores	42%
EPS: Rs. 12.72	38%
Order booking Rs. 3511 crores	28%
Sales and other income Rs 3318 crores	20%



MAJOR ORDERS

- **Largest Twin-Strand Slab Caster for Bokaro**
- **India's First Advanced Steckel Mill for Salem Steel Plant**
- **Largest and Fastest Paper Machine**
- **India's First Vertical Dairy for NDDB**
- **Asia's Largest Automated Milk Plant at Gandhinagar**
- **Gas Platforms for ONGC**
- **2 x 20 MW Co-generation Power Plant for Tata Chemicals**
- **Switchboards and equipment for fertilizer, chemical, petrochemical and cement plants**
- **C-Power Air Circuit Breaker and Z-line Petrol Pumps widely accepted.**

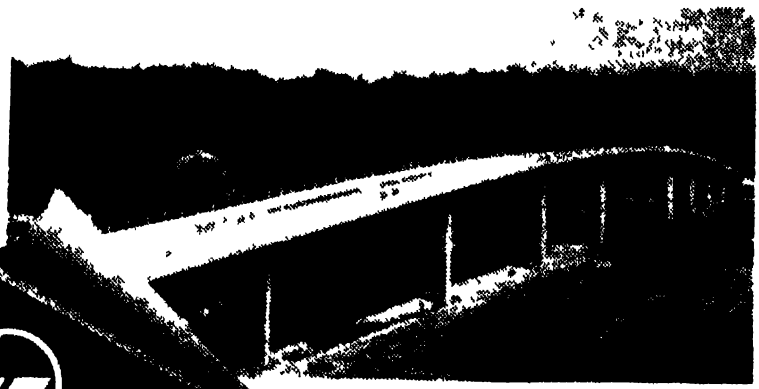
Assembly line of L&T's new Air Circuit Breaker

Vacuum column manufactured by L&T being erected at a refinery in Mangalore

Construction

Significant orders received

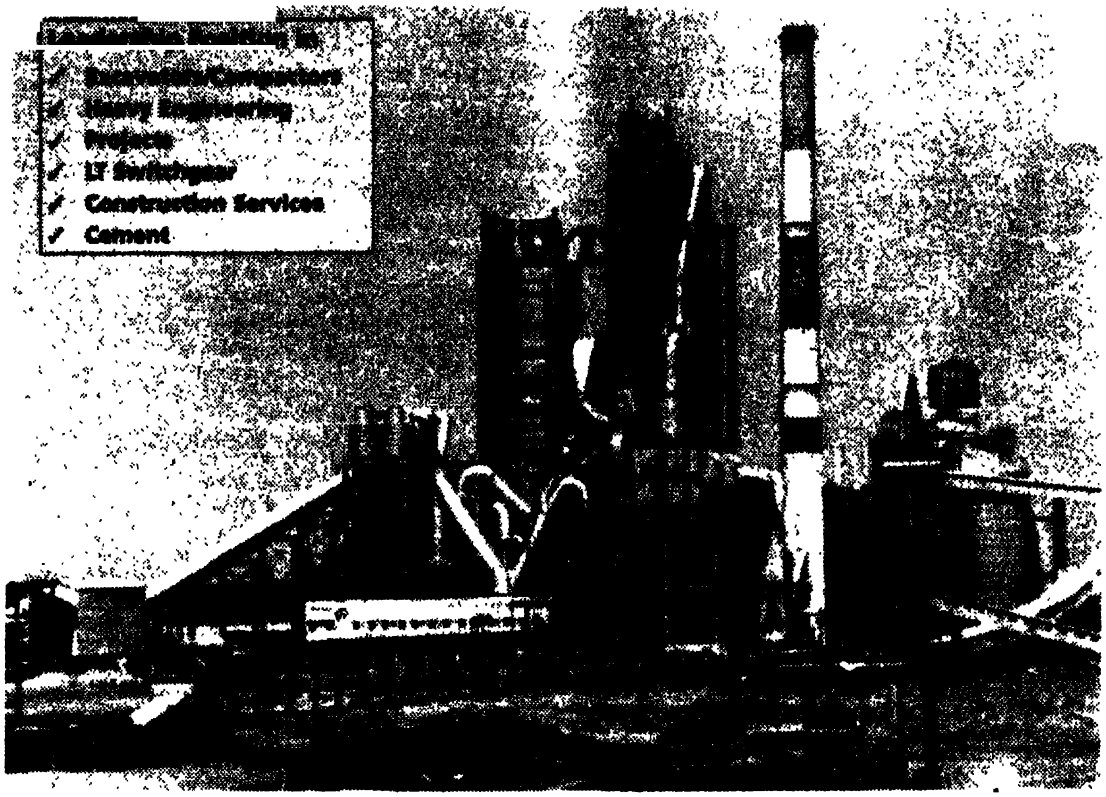
- Civil/mechanical work for petrochemical and steel plants
- Four-laning of section of NH1
- Project for supplying water to 700 villages in Andhra Pradesh



Projects completed include major cement plants as well as viaducts bridges and tunnels for Konkan Railway L&T received Excellence in Construction Award from Konkan Railway Corporation

Cement

- Commercial production commences at Hirmi plant
- Production at Awarpur and Jharsuguda plants registered significant increase



International Business

- Heavy engineering plants and systems for Qatar, Saudi Arabia, Kuwait, U S A , Singapore
- Switchgear, drives, controls and petrol pumps exported to Europe, Africa, Middle East and South East Asia
- Major bridges completed in Malaysia

One of five bridges built by L&T in Malaysia

Quest For Excellence

L&T's cement plant at Hirmi in Madhya Pradesh, installed by the Company on an EPC basis

New Projects

- 2 x 250 MW power plant to be set up in M P, with Community Energy Alternative, U S A and SAIL
- Joint venture formed with Sargent & Lundy, U S A for EPC services in power sector.
- 1 5 million tpa Gujarat Cement Project to be commissioned by September, 1995 Plant capacity to be doubled soon.
- Work on the 1.75 million tpa cement unit in A.P. to commence shortly.
- State-of-the-art glass container plant being set up at Nashik.

Community Service

25 year record of medical and welfare services to the community

- 'Good Corporate Citizen Award' received from Bombay Chamber of Commerce and Industry for conspicuous achievements in improving the quality of life in the community

Prospects

Response to changing economic environment

- Sharper customer focus.
- Renewed emphasis on technology, quality, flexibility in manufacturing and quicker response.
- Creating strong EPC organisation
- Achieving balance between ensuring growth in current earnings and investing in the future.

L&T aims to build on its traditional strengths and fulfil its vision of becoming a world class company dedicated to professionalism and excellence.

(Synopsis of statement of Mr S D Kulkarni, Managing Director and Chief Executive Officer, circulated to shareholders)

LARSEN & TOUBRO LIMITED

can, and will, be destructive It has lost trust of the people and is widely known as a party of corruption [Diwan 1993b] Marxist parties have been always perceived as a non-national party They have remained, and will remain, fringe parties with small pockets of strength The various groups of Janata Dal and regional parties have strengths within their own areas where they represent or manipulate the caste and religious minorities The people who get elected on its ticket are in politics for their personal egos and gain They will make deals with any group of party to gain some power The BJP alone stands as a party of principle It has been growing but has not been able to consolidate its strength so as to gain political power In the coming years, and next elections, there may be no single party to form a government that can develop and carry on a comprehensive programme for the genuine benefit of the country instead of some very small section of it During this period, the policies will remain *ad hoc*, based on a mixture of the two virtually contradictory paradigms

Notes

[An earlier version of this paper was presented at the 23rd Annual Conference on South Asia University of Wisconsin Madison WI November 4 6 1994 A revised version is to be presented at the 1995 Annual Meeting of the Eastern Economics Association March 17 18 1995 at New York I am thankful to Ashok Bhargava Suresh Desai Renu Kalhanpur Mahesh Mehta Mukund Mody and Sabine O'Hara for helpful suggestions]

1 This story is given in Valmiki's *Ramayan* the *Sundar Kand* section and refers to a conversation between the soldiers from Kishkinda

2 This is particularly true of English medium print and electronic media partly because it takes its cue from the western media For example *India Abroad* an ethnic weekly published from New York and a mouthpiece of government and international capital devotes 5 to 10 pages every week to laudatory stories and news about the desirability of these reforms

3 Much of such discussion appears in the pages of *Economic and Political Weekly*

4 To give one example five presidents of Association of Indian Economics Association (AIES) wrote a letter to the prime minister questioning economic reforms This letter is contained in Diwan 1991a

5 I have elaborated the concept of RNI in Diwan 1993a RNI are classified into three groups Assimilated RNI made up of (i) ruling group (ii) loyal opposition and (iii) non-assimilated RNI The RNI are contrasted with Non Resident Indians (NRI)

6 There is an oft quoted remark what is good for General Motors is good for America' It is ascribed to Wilson, an executive sometimes a secretary in the federal government

7 Galbraith 1992 and Reich 1983 among others provide good examples and explanations

8 In the 1994 November elections only 37 per cent of the eligible voters exercised their vote Yet the winner and the media have promoted the idea that electorate have given the Republicans a mandate A little thinking should persuade any one about the absurdity of this argument a mandate being defined by a small minority

9 Support for the status quo is intensely *bipartisan* in the truest sense real access to the honeypot in most cases comes only from service appointments, and connections within the Republican-Democratic Party system A cynic could even say the *corruption of Washington*—because bluntly that is what we are talking about—is closely bound up with two party politics Influence peddling access is one of the most important components and privileges of party spoils system Phillips 1994 p 52 [emphasis in italics in original]

10 In fact freedom' is code word for freedom to exploit in order to make profits

11 Those people in Washington who write the complex tangle of rules by which the economy operates have over the last 20 years rigged the game by design and default – to favour the privileged the powerful and the influential At the expense of every one else we are in the midst of the largest transfer of wealth in the nation s history It is a transfer from the middle class to the rich' [Barlett and Steele 1992 pp 2 3]

12 There is a well defined concept of a techno economic paradigm [See Diwan and Desai 1990 and Diwan and Chakraborty 1991] For an implication of this paradigm on competitiveness [Diwan and Filpo 1992 and Diwan and Chakraborty 1993]

13 His three international best sellers deal with technology *Future Shock* analyses the rate of technical change *The Third Wave* examines the direction that the technology and its change is taking *Powershift* attempts to explain the shift of power to information and technology

14 As a result of the slight increase in interest rates over the last few months, *Fortune* magazine estimated that paper losses on the US government bonds alone totalled $ 600 billion through the first nine months of 1994, with global bond markets having lost a total of $ 1 5 trillion among them The latter averaged out to around $ 263 in paper losses for every man woman and child on the planet' [ibid p 7]

15 Attention has focused on president s willingness to make deals with business and financial lobbies even more quickly than with labour environmental and minority groups Changes like these tell the real story of the transition from Old Democrat to New Democrat What Clinton has done is to shift his party from so called interest group liberalism to interest group centerism away from the prospending liberal type lobbies that represented *people* (labour seniors minorities and urban) to a more upscale centrist (or centre right) group that represents *money* (multinationals business banks, investment firms trial lawyers trade interests superlobbyists investors the bond market and so on) *This is the ultimate triumph of Washington s interests group ascendancy the party of the people can no longer be the party of the people* " [Phillips 1994 p 52 (emphasis in italics in original)]

16 Compare it to Gandhi's ideas In well ordered society the securing of one s livelihood should be, and is, found to be the easiest thing in the world Indeed, the test of orderliness in a country is not the number of millionaires it owns, but the absence of starvation in its masses [Gandhi 1966, p 39]

17 'This year Bolivia celebrates only the 40th anniversary of the revolution that quashed a malignant oligarchy *where private enterprise was the disease and nationalisation was the cure* Thus Bolivians look upon the worldwide movement towards free-market economies with suspicion *The national memory equates private enterprise with unspeakable suffering* Bolivia is not alone Its neighbours have similarly dark recollections of a free market at its most wanton It was only in 1964 that Ecuador shed the dreaded 'Wasipungo' system – forced Indian labour with the United Fruit Company of Boston acting as overseer Those who have survived its worst transgressions *know that* a free market is *often free in name only* ' [Rosenberger 1992 (emphasis added)] Rosenberger should know since he was a former UPI reporter

18 'A final concern, which the World Bank has made only feeble efforts to address is its bloated and overpaid bureaucracy Those at the World Bank would do well to accept a hint of self-sacrifice in their professional lives rather than marauding as if they were partners in some great Hanseatic banking house ' [Levenberg 1991]

19 Merchant 1980 articulates persuasively how language metaphor and images changed as the commercial and industrial society accelerated to justify the exploitation of both women and nature The metaphor of the earth as a nurturing mother was gradually to vanish as a dominant image as the Scientific Revolution proceeded to mechanise and to rationalise the world view The second image nature as disorder called forth an important modern idea that of power over nature Two new ideas those of mechanism and the domination and mastery of nature became core concepts of the modern world p 2

20 'In 1992 alone US business spent perhaps $ 1 trillion in marketing simply convincing people to consume more and more goods This exceeded by about $ 600 billion the amount spent on education – public and private – at all levels Under these circumstances we can expect people to grow up with their heads full of [biased] information about saleable commodities and empty of knowledge about human history morality culture science and the environment' [Foster 1995 pp 4 5]

21 For example such power promotes sexual abuse ' The most recent statistics estimate that one in four girls and one in seven boys is sexually abused by age 18 Like other forms of rape and sexual predation the sexual abuse of a child is *not a crime of desire but of power* Sexual abuse is a way in which the molester seeks control over the problems in his or her life Sexual abuse is not the province of the lurking stranger in the shadows or the anonymous newcomer in the dark house down the street The majority of abusers are the child's father mother, sibling, next door neighbour trusted family friend They are people who have been abused in some way themselves " "I base my belief on an unique perspective Not only am I a survivor of childhood sexual

us. But I also have spent the last three years researching the topic for my doctoral dissertation" [Schultz 1995, pp E1-2].

2 "Growth most clearly immiserates those who suffer an absolute decline in real income, which can happen even as per capita income increases It is a central fact about recent US growth that the median (middle by number) hourly wage of production workers has fallen about 13 per cent since 1973 The number of poor people below 50 per cent of the poverty line increased from 7 7 million in 1975 to 15 million in 1992 Some 7 million people were in that state [homelessness] during the late 1980s according to a recently released Clinton administration study A Census Bureau report of October 1994 disclosed that even in 1993, an year in which an economy grew by 3 per cent, median household income declined by 1 per cent, increasing the median household income decline since 1989 to 7 per cent" [Herman 1955, p 45]

Taylor argues that these policies have resulted in the transfer of $ 50 billion from the developing to developed countries

See Diwan and Hu (1988) for the case of Sudan Sarkar (1993) has summarised a number of studies all of which show that Bank Fund policies are a source of further destabilisation and underdevelopment 'Mali is one of the World Bank and IMF's model African pupils having fully implemented over the last 12 years all key elements of the SAP programme including massive salary cutbacks devaluation of the currency and liquidation of state enterprises But with their purchasing power declining by over 117 per cent since the start of adjustment, people finally rebelled "against SAP" this February (1994), barricading streets and ransacking buildings A similar unmasking of another model SAP occurred more than a month earlier, in early January (1994) The indigenous Zapatista rebellion in Chiapas, Mexico drew global attention not only to popular opposition to North American Free Trade Agreement (NAFTA) but also to the staggering consequences of 13 years of structural adjustment some 20 per cent of the workforce unemployed, another 40 per cent underemployed over half the population below the poverty line, and massive discontent all around" [Bello and Cunningham 1994, p 66] The Mexican balloon of financial success burst on December 20 1994 for any one to see

"The average adult in the US watch 21,000 television commercials a year, about 75 per cent of which are paid for by the 100 largest corporations " [Foster 1995, p 6]

"One of the great achievements of contemporary ideological warfare has been to debase the terms of political discourse As Orwell predicted, this achievement has undermined the possibility even of talking sensibly about what is happening in the world" [Chomsky 1995, p 19]

Liberman (1992) He describes how private companies hire public relation (PR) firms to produce tapes that resemble independent news reports These tapes, technically sophisticated, self-serving and highly biased, are made available to television news shows that carry them and add credibility, since the shows never identify the sources The result is that what we see on the news media are not news but subtle propaganda; and now not even so subtle. These are the 'fake news' Thus, the reporting of Iraqi atrocities against Kuwaiti babies were fake news produced by the PR firm Hill and Knowlton, and so were the testimony given before the UN and the US Congress Incidentally the president of the PR firm Hill and Knowlton is Craig Fuller, former Chief of Staff to George Bush

28 Chomsky (1994, p 56) It is worth noting that Chomsky is one of the brightest minds in the US and has written extensively on issues of foreign and economic and domestic policy Yet he has never been asked to comment on domestic or foreign policy in the mainstream media, both print and electronic it looks as if he has been blacklisted

29 Government policy has been known to cheapen labour wage rates A proposition was offered at the All India People's Science Network's Delhi meeting in mid-August 1994 According to it, displacement, thereby increasing labour supply at the cheapest rate has been as much one of the designed objectives of the dam as power or irrigation It created the pool of cheap labour needed by other development activities such as industry and agriculture It has been estimated that in the 40 years from 1951 to 1990 185 lakh people have been displaced an average of 4 60 000 unfortunates every year Three out of every four have been ousted by dams and 77 per cent have been tribals Only 29 per cent have been rehabilitated by government estimates leaving 132 lakh people uprooted from their homes and desperate for whatever marginal work that comes their way The earliest trend-setter of the multipurpose projects Bhakra displaced 36,000 hill people, and the latest in the series Tehri will oust up to 85,000 Sardar Sarovar when complete, will dislodge over 10,00,000" [Roy Dunu, 1994, p 3129]

30 It is interesting to note that Manmohan Singh has been a bureaucrat for most of his career IMF and World Bank are deeply entrenched bureaucracies their rhetoric to the contrary notwithstanding Even though they sing praises of entrepreneurs capitalists, and condemn bureaucracy at any opportunity they rarely like to deal with other than bureaucrats It is not accidental that the people in the good books of World Bank and IMF throughout the world are all faceless bureaucrats ready to change their tune at a moment's notice

31 To an RNI the very certification by a western institution is a proof of its goodness this is unfortunately the very basis of an RNI, of the assimilated kind [Diwan 1993a]

32 I have developed the concept of RNI and explained it in Diwan 1993a This generated a healthy debate with Rajmohan Gandhi in the different volumes of *Gandhi Marg*

33 *EPW*, October 22, 1994, p 2785 (emphasis added) It is interesting that the lament is against the white man, not a Japanese who is also part of the success story

34 "Week after week, many of America's best known economists are being summoned before congressional committees for expert advice on what to do about the economy But while given respectful hearings, their counsel is almost certain to be rejected, to the continued frustration of a profession that has long suffered such indignities " The Experts Talk But Who Listens" Robert D Hershey Jr, *The New York Times*, January 15, 1992, p D2

35 Bhagwati and Srinivasan (1993). They were kind to send me a draft version; the above quote is from this draft, p 27 (emphasis added).

36 'Mexico Takes US Aid with Thanks and Suspicion' *Times Union*, Albany, New York, February 5, 1995, p F1

37 These numbers have been reported in the government friendly, virtually its mouthpiece, *India Abroad*, January 13, 1995 p 22, as being from a report of the Comptroller and Auditor General of India in its review of the government debt at the end of March 1993, We have added the percentages in the brackets to make these numbers ineligible.

38 The confidence was gained at least to the extent of allowing the reserves to rise to a level of about $ 12 billion by the time the budget for 1994-95 was presented The fact that after remaining stagnant for year and a half, exports rose by 20 per cent in 1993-94 helped marginally in the process; a decline in international oil prices and the stagnation in import intensive industrial production also helped in bringing down the balance of payments deficit But no significant additions to reserves took place through export expansion and import compression" [Bagchi 1994, p 1064]

39 These calculations have been made on the basis of purchasing power of the local currency It is interesting to note that The World Bank is now estimating purchasing power of the currency and ranks the countries by this measure Not unexpectedly, this measure pushes the US from the 7th to the second rank What objectivity!

40 "India's market for hard liquor is estimated at $ 1 6 billion and is expected to grow by 15 per cent a year' [Foreign - Made Liquor Is Pouring In, *India Abroad*, January 20, 1995 p 1] Again, 'In 1993 close to 60,000 people, the highest toll for any country, lost their lives in road accidents in India, many more than in the previous year Delhi alone accounted for as many as 1,900 deaths" [*India Abroad*, January 20, 1995, p 12]

41 Instead they have devoted their energies in fighting Hindu nationalism, something that comes naturally to them

42 A good deal of work on Swadeshi has been done See Diwan (1991b), Diwan and Lutz (1985) and Gurumurthy (1994) to name only a few

43 We are really in for a period of 'de-industrialisation' We are only beginning to feel the type of development awaiting us as a result of the IMF/World Bank inspired 'structural' readjustment programme" [Ghosh 1991, p 2607] The situation has not improved since

44 "It was to be expected that the results of these elections [four states in November 1994] would be scrutinised for what they reveal about people's attitudes to the central government's economic liberalisation policies Most curious in this context is to find the Congress now claiming that election verdict does not amount to a popular rejection of these policies when it was the Congress and the prime minister in person who chose to make liberalisation a major, if not the main issue in the election In meeting after meeting Narasimha Rao warned voters that if they failed to return the Congress to power that would be ta as a signal worldwide of the likelihood reversal of the policies that produced

wondrous results. . How much out of touch with political reality even a political animal like Narasimha Rao, not to talk of the finance minister and his like, can get once the essential task of policy-making and government are entrusted to bureaucrats in the prime minister's office and the finance ministry? How else is the delusion that the ordinary people of Andhra Pradesh and Karnataka would be mesmerised by the level of government's foreign exchange hoard and the quantum of foreign funds supposedly flowing into the country when their own lives are being blighted by the unrelenting rise in prices of all essentials of life or by the claim that control and regulations had been relaxed for industrialists and businessmen when their own personal experience of coping with local power structures grows ever more brutal to be explained'" *EPW* Editorial December 10, 1994 p 3111]

45 For example, the mouthpiece of international capital and economic reform ideology, *India Abroad*, of February 24, 1995 has the major headline "Economic Drive Pushes On" conceding at the same time, "The average Gujarat voter has not shown much enthusiasm for the country's economic reforms that formed the theme of Rao's campaign speeches. The short-term effect of the reforms has been inflation, which opposition parties have tried to exploit by making populist economic promises" (p 1). Note the ideological insinuation the opposition parties are irresponsible for making populist promises. After all poor people do not buy advertising space. Another example of similar propaganda technique is on page 24 where the headline in large letters reads, 'Exports could hit $25 million" while the small print story underneath provides a different picture, namely, 'Imports during the first three quarters of 1994-95, however, have outstripped exports widening the trade deficit. The adverse trade gap for the period stands at a little over $2 billion, as against $731 million in the same period.'

46 It is best articulated by Huxley 944

47 Easwaran (1984 pp 10-12, vol 3). It is clear that people in the US are living in no Golden Age. On the contrary, the civil society is under very serious stress. In fact economy and civil society seem to be negatively related. To explain this negative relationship, I have argued that there are two types of affluences one defined by material goods and other by the care of those whom we care. The US has affluence of material kind and poverty of the caring type. See Diwan (1991b and 1995).

48 Sadly, and unfortunately, the RNI intelligentsia ignored and condemned it, partly because it is a Hindi word and has images of the Hindu heritage, both anathema to the 'rationalist' colonial minds. There is a need for all who are about this country and society to rethink about their own paradigm and revisit Gandhian ideas, this time with some humility and objectivity.

Cartography in Colonial India

U Kalpagam

This article examines some aspects of surveying and mapping in 19th century colonial India. It shows that the emergence of modern cartographic representation in India is intimately linked to the colonial project of conquest, rule and administration. After examining the early mapping efforts in the latter half of the 18th century, the paper then focuses on the three major surveys – the topographical, the trignometrical and the revenue surveys that were carried out and which were all crucial to mapping India.

THERE is by now a general acknowledgement that British colonial rule in India produced a vast body of knowledges about Indian society. Critical historians and social scientists have often pointed to the biases, omissions and interests and motivations behind such portrayals of the colonised society, although they still do form an important source material for much of the history writing of that period. The production of the colonial archive is the immense project of conquest, rule and administration of a vast subcontinent called the Indian Empire. The informational requirements of the colonial state in conjunction with the discourse of scientific rationality as part of the enlightenment rationality gave rise to a mutual complicity of the power/knowledge relation that has not so far been explored. The forms of knowledge produced by the colonial state has not received adequate attention, though an inspirational paper by Bernard Cohn (1988) promises to undertake such a project. Cohn outlines a set of investigative modalities by which knowledges of Indian society were generated. These modalities were the historiographic, the observational/travel, the survey modality, the enumerative, the museological, the surveillance and the sanitary modalities. In this article I will consider cartographic knowledge and focus on the emergence of modern cartographic representations in India, showing how it was intimately linked to the colonial project of rule. After examining the early mapping efforts in the later half of the 18th century, the paper then focuses on the three major surveys – the topographical, the trignometrical and the revenue surveys that were carried out in most parts of the country during the 19th century and which were all very crucial to mapping India from the field and village level to the country level.

I

Surveying and Mapping as Political Technology

Surveying and mapping were important aspects of the technologies of state formation in the early modern period in Europe [Mukerji 1983], and it can be seen that in the heydays of empire-formation these practices were carried out in other parts of the world as well. The whole period of 19th century colonial rule in India involved a series of surveying and mapping operations as newer territories came under British control. Representing what came to be known as India pictorially in the form of maps involved very complex processes of retrieving knowledges, reconstructing histories, laborious measurements, calculations and enumerations in which the advances in the sciences of measurement and cartography rendered it possible to define and fix boundaries, demarcate territories and locate persons and objects in fixed spaces. The need for such fixity became more paramount as the revenue administration of states gained importance and more so when such administration had to be conducted from a distance. Even apart from the exigencies of revenue administration which are not an exclusive feature of modern states, such states even in the days of the empire prepared the ground for the emergence of modern nation states. Whereas for pre-modern states territory was important to delineate the kingdoms for military and taxation purposes, new political rationalities emerged with the modern state. As governance and the welfare of people progressively came under a new matrix of calculating rationality, it became important to define and demarcate the site of political and administrative power. In order to introduce and consolidate these new political rationalities, demarcation of administrative spaces on a scientific basis formed an important agenda of state making in the 18th and 19th centuries. In the course of time, the scientific mapping of space also acquired a new epistemological significance. Maps function as a measure, as a means of inquiry and as a method of examination. All of these functions did not quite arise at the same time nor are they non-overlapping functions.

II

Early Mapping Efforts

One of the early milestones were the *Bengal Atlas* and the *Map of Hindoostan* by James Rennell (1788), the latter which is here taken up for some detailed analysis, is an extremely interesting example of the nature of the geographic genre of that time accompanied as it was by a detailed Memoir. D'Anville, the French geographer compiled the first modern map of India which was published in French in 1751-52, and was based entirely on knowledges derived from the routes of various travellers all through recorded history and from some rough charts of the coasts [Markham n.d.]. Route maps or itinerary maps typically show the succession of points along one or more routes but not what lie between routes or how to get from one route to another. With the Battle of Plassey in 1757 marking the beginning of British rule in India began the era of surveying and mapping which was to continue for well over a hundred years. Rennell's survey of Bengal and Bihar laid the foundations for the first map of India based on survey methods for the distances to be measured were actually chained and observations were taken for latitude and longitude at certain stations. Reducing from the original surveys he made the maps of the rivers Ganges and Brahmapootra on a scale of two inches to a mile and also compiled the maps of the districts of Bengal and Bihar on a scale of five miles to an inch from 500 original surveys. These maps were published in 1781 as the Bengal Atlas and was dedicated to Robert Clive, Warren Hastings, Hector Munro, Verelst and Company [Markham 1871]. Appearing at a time when modern historiography was at its formative stages in India, the preliminary maps and surveys of this atlas were used by historian Orme for his first part of *A History of the Military Transactions of the British Nation in Indostan* (1745-1760) which appeared in 1763, in three volumes recounting the early military achievements of the English in India. Not only did the constitution of geographical knowledges of India entail a retrieval of history, it also served to write new histories as well.[1]

The *Map of Hindoostan* was compiled from the evidences of various route surveys and was first published in 1782. It subsequently went through three editions with its accompanying *Memoir of a Map of Hindoostan or the Moghul Empire* published in 1788, dedicated to the president of The Royal Society as an attempt to improve the geography of India and the neighbouring countries. For the 1788 edition Rennell

claimed that he had collected far more information from various sources which enabled him to produce a map which was more perfect and therefore decided to draw it on a larger scale with the surface of the present one exceeding the former in the proportion of two and a quarter to one. The quantity of land represented in it was claimed by Rennell as equal to one half of Europe. A cartographic representation is not a mirror image of reality. Proper scaling and establishing limits and boundaries enables the possibility of truth which is sought to be grasped through a process of approximation as more and more facts to fill in the void inner space of a map are ascertained. Route surveys of Huddart, Pearse, and Fullarton effected an outline of the hitherto unknown shape of the southern penninsular region which complemented what was then known of the shape and size of the Moghul empire in the north. Thus for the first time India could be viewed as a whole from four detached sheets that could be put together.

The *Memoir* also carried 'sketches' of the history of the 'Moghul empire and that of the Maharattas, the narrative of the former to indicate the possibility of a similar British empire, and the latter narrative was to describe the formidable foe who needed to be vanquished. India was not to be envisioned as a fixed entity since the days of Alexander, the turbulence of history had made it into a malleable entity and the purpose of selectively reconstructed narratives of history was meant to impress the idea of the non-fixity of political spaces. Rennell explicitly noted,

> I shall not attempt to trace the various fluctuations of boundary that took place in this empire. It is sufficient for my purpose that I have already impressed on the mind of the reader, an idea that the provinces of Hindoostan proper have seldom continued under one head, during a period of 20 successive years, from the earliest history, down to the reign of Akbar in the 16th century ... and that sometimes the empire of Delhi was confined within the proper limits of the province of that name [Rennell 1788].

Early British historiography, envisioning the possibility of an Indian empire, not only provided the chronology of different rulers but also attempted to present the locale of those regimes. The *Memoir* also contained detailed notes on each of the principal states and they certainly surpassed what is normally defined as geographic details, encompassing as they did information on the military capabilities as well as the revenue potential of these states. That is, it served both as an instrument of inquiry and of examination and evaluations of the strength and weaknesses of the rival states. Compiling evidences from the then recently translated *Ain-i-Akbari* of Abul Fazil by Gladwin under the patronage of Warren Hastings, and Frazer's *History of Nadir Shah*, Rennell sought to demarcate the 11 'Soubhas' of Akbar, also referring to it as "the original division of India" which were further subdivided into circars and 'purgunnahs'. In so doing he marked the boundaries of the 'soubhas' noted the capitals, remarked on the Hindu practices of naming places, citing the authority of the Orientalist William Jones traced the etymology of place terms as the Deccan', and most importantly noted the revenues of the provinces at the time of Aurangzeb, carefully noting so as to enable the reader to make a just estimation of its absolute value that the "products of the earth are about four times as cheap in Hindoostan, as in England" [Rennell 1788]. Thus, it needs to be noted that right from the beginning colonised spaces were predominantly conceived as revenue generating ones. In outlining the divisions of 'Hindoostan' that were then under the company possessions he even presented the company receipts and disbursements from Bengal, Bombay and Madras indicating also the total net revenue in India. Accustomed as we are today to reading the political maps of nations the details of the revenue and disbursement statements though contained separately in a *Memoir* is surprising. Indeed it needs to be read as a statement of political intentions, and as yet unaccomplished task, the task of conquest and the establishment of a 'revenue state', which like all other endeavours needed to be reckoned in terms of the costs and benefits.

While the geographic description of Bengal was possible because of the Bengal Atlas and the region was in fact surveyed by Rennell himself, for most parts of the other regions no such topographical survey had been conducted then, and the geographic knowledges were primarily derived from information provided by various route surveys of the troops. Other information such as the dimensions, the geographic features, the places with their positions sometimes drawing evidence from as far as Ptolemy, the history of the possessions and the genealogy of the ruling families, the relationship of the present rulers with their neighbours, the size of revenue collections and their military strengths were all sought to be presented for each of the states in the *Memoir*. There were indeed rather scanty references to the inhabitants in each of the regions, and these were mainly in terms of third person accounts of how amenable they were to conquest or resistance, such as for instance while writing about Mewat (what is probably known as Meerut today) Rennell remarks,

> its inhabitants have ever been characterised as the most savage and brutal, and their chief employment, roberry and plundering. At the present time, Mewat is so famous a nursery for thieves and robbers, that parties of them are taken into pay by the Chiefs of upper Hindoostan, for the purpose of distressing the countries which are made the seat of warfare [Rennell 1788].

Even though for the most part, Rennell's map was based on the route surveys, he encountered significant problems of measurement. Specifying the dimensions and distances of regions was quite complex. An itinerary measure was adopted, which in most parts of Hindoostan Rennel found was called coss or crores which was then commonly estimated as two British statute miles. This measure of coss varies depending on what was fixed as the length of Coss by the different emperors, and Rennell proclaimed his inability to find what was fixed by Akbar to be used as a standard by him nor would that have enabled him to reduce all to a standard one, for the measures he had were in computed cosses and there were regional differences in the measure of coss as well.[2] Unless all the measures of the different regions were reduced to a uniform standard it was not possible to figure out the relative size of each of the regions. As Rennell noted, this was not something unique to India.

> It is no more than what happens in different provinces of the same kingdom in Europe. But as far as we have any data for making a just comparison, the coss does not vary so much as one-sixth part over the whole country, and between the northern and southern extreme of India, (that is, in an extent of about 1700 miles) the difference is not more than one-sixteen part. The miles vary much more in their proportions, in the different parts of Europe [Rennell 1788].

Further the problem of specifying the dimensions of a region is to convert measured distances to horizontal distances. Here too no standard conversions can be done as it depends on the terrain of the land and the winding of the roads. While noting that the roads in India have "a degree of crookedness, much beyond what we meet with in European countries" [Rennell 1788], the degree of winding Rennell noted must be estimated taking account of the 'evenness, dryness, and openness" [Rennell 1788] of the country, for which some local knowledge was necessary. For each region the evidence on dimensions from different sources, measured in different cosses that differed both spatially and over time, had to be assessed and a judgment made of the most plausible one.

The era of scientific surveying and mapping that began from early 19th century had to grapple with yet more numerous problems of measurements. Whereas in some surveys the technical problems in the introduction of European methods of measurement had to be surmounted, in yet others the conflicts between the European

be resolved. In what follows, some of these issues are highlighted.

III

Era of Scientific Mapping

While Rennell's *Map of Hindoostan* was for the large part based on route surveys, his survey of the Ganges river in 1764, and then the survey of Bengal and Bihar in 1765 following closely Plaisted's survey of the coasts of Chittagong in 1761, and Cameron's survey of the 24 Parganas may be seen as having inaugurated the era of scientific surveying in India. Even though Rennell was appointed surveyor-general of Bengal in 1767, it was only in the early decades of the 19th century, and more so in southern India that scientific surveying made rapid progress. As more and more areas came under company rule particularly after the defeat of Tippu Sultan, there were considerable newly acquired territories to be surveyed and settled. As the company troops advanced towards central and north-west India, the need to know the geography of the land became more apparent as the commanders of troops had little knowledge of the country and its topography beyond the main roads. A great deal of geography was yet to be made known. Individual surveyors working on particular roads or areas found it impossible to envision how their new knowledge of the area would fit into the surveyor-general's latest jigsaw map, for the country was not yet known in its totality. The idea of different kinds of surveys such as the military, the topographical, the trignometrical and the revenue surveys under different administrative controls evolved in this context.

The military surveys as the name suggests were for military purposes, and the quartermaster-general was in charge of the various military surveys. Wherever prior route surveys existed, these were generally used for the advancement of troops in new territories, but for the most part surveys had to be done so as to chalk out supply routes and encampments, as well as the existence of forts, etc. Some of the route surveys were carried out by the Corps of Guides, and this Corps was merged with the quartermaster-general's office in 1806. In 1804 the Madras Military Institution was started by William Bentick, then governor of Madras for the purpose of training military cadets in mathematics, drawing, surveying and military fortifications. Under the leadership of Anthony Troyer, who was earlier an officer in the Austrian army, the plane-table was introduced for the first time to the Madras army. The students of the institution spent several months a year on field survey, triangulating and planetabling a fresh area in 1816, it had surveyed 15,000 square miles covering the greater parts of north and south Arcot, and Chittoor. The important military surveys done by the quartermaster-general's office were the surveys of Travancore and the Nizam's Dominions.

Apart from the military surveys, there were three other surveys going on simultaneously – the topographical survey, the trignometrical survey and the revenue survey. The topographical surveys were meant to survey and map the topography of the country, in particular to mark the administrative boundaries and the villages. The first important topographical survey in the south was commenced by Colin Mackenzie in 1800 in Mysore and Kanara, after the defeat of Tippu in 1799. These surveys, as will be shown later, were carried out in a systematic manner involving measurement of base lines at suitable intervals and triangulation. Measurement by triangulation was then being made popular for the first time as it was "founded upon Geometrical certainty and truth".

Both in the Mysore survey and in the survey of the ceded districts in 1809 that Mackenzie was in charge, particular attention was paid to administrative boundaries and villages, and comprehensive statistical memoirs on the resources of the country were compiled for each district. In the survey of the ceded districts, Mackenzie with the help of Indian interpreters also made a collection of historical and archeological records which he afterwards extended to other parts of India and Java, and which have come to be better known than his surveys [Dirks 1993]. There were other district surveys as well carried out by Indian assistant revenue surveyors and under the charge of the revenue board. These surveys included a general topographical survey, and then a survey of tanks, watercourses and cultivated areas. The revenue surveys were to survey the plots of fields in the villages, determine the nature of land rights, and the revenue potential based on past assessments.

The trignometrical survey initiated by William Lambton was to lay down a continuous series of triangles such that the positions of the places could be unambiguously fixed by determining the latitudes and longitudes. In the early years no presidency was interested in making a single plan for co-ordinating the scattered surveys, nor was any scheme put into action for a continuous progressive survey of the whole country until Lambton's trignometrical survey. Later on a decision was made by the directors that it was wasteful to maintain three separate and independent surveyor-generals for each of the presidencies, each with his own department and Colin Mackenzie was appointed surveyor-general in 1815 with the task of coordinating the surveys of all the presidencies, and compiling all the general maps that might be required but without the general authority over Lambton's survey.

IV

Topographical Surveys: Science, Statistics and Surveillance

The British project of governance entailed first defining the territory and fixing the boundary, and an understanding of the realm contained therein in terms of people and things. The topographical surveys of Colin Mackenzie are considered to be a major marker in the history of surveying in India. The Mackenzie endeavours clearly indicate that the objectives of science, in particular the collection of tropical specimens for the newly emerging natural sciences, the collections of statistics of people and resources to adminster and exploit, and the objective of surveillance were all conjoined in the topographical surveys. When Mackenzie was appointed in 1799 to survey Mysore, the governor-general proposed that the attention of the surveyor should not be confined to mere military or geographic information, but that his enquiries should be extended to a "statistical account of the whole country..." [Phillimore 1950:91]. Mackenzie submitted in 1800 an elaborate Plan of the Mysore Survey', wherein he noted:

> The Survey of Mysore should embrace two great leading objects, Mathematical and Physical.. The Mathematical part including a Geographical and Geometrical survey will comprehend; (1) A survey of the Frontier and Exterior Boundaries of Mysore... The ascertaining with some precision the boundry and line of demarkation between the Rajah of Mysore, the Nizam, and the Mahrattahs, is necessary to be attended to early, in order to avert, or clear up, any difficulties... from the intermixture of inferior Divisions, from parts of Talooks or Purgunnahs being sometimes insulated...from their ancient Cusbas... (2) A series of Primary Stations to be obtained throughout Mysore in all its extent, for which the country, from its numerous Peaks and Hills, many of them remarkable for the building upon them, is peculiarly favourable, forming a series of triangles connected by Bases to be carefully measured,... and joining the Surveys already executed in the Malabar Province on the west, with that of Baramahal on the east, will form the ground of a work mutually illustrating, and correcting, the labours of the several surveyors employed afterwards on the several portions of the country in detail... (3) On this... foundation the Country in detail is to be laid down. The position of every town, fort, village ascertained by correct bearings of the primary or secondary stations, a register of which should be preserved

for reference and verification afterwards, beginning with the parts next to our frontier and proceeding in succession to embrace every individual plan carefully remarking all the rivers and their courses the roads the lakes tanks defiles mountains and every remarkable object feature and property of the country

In this manner by laying down the smaller districts or Purgunnahs and their respective boundaries in detail the limits of the greater divisions will naturally follow (4) The situation extent figure and contents of the country in all its divisions being thus obtained the position of the principal points ought at the same time to be corrected by astronomical observations connected by a series of triangles This branch might be executed by persons expressly employed for this purpose acting in connection with the general survey and duly communicating its progress the corresponding observations being also regularly transmitted to the observatory at Madras (5) But another important branch of land or agricultural survey would be equally desirable It would include the Divisions of the Lands into hills and mountains plains and valleys cultivated and waste the species and quantity of each kind of cultivation the revenues allotments of land also the waterworks canals reservoirs and a number of objects connected with these [Phillimore 1950 91 92]

The physical branch of the survey was to include all remarks facts and observations [Phillimore 1950 92] that can be conducive to the improvement of natural history The particular branches that were to be covered by the survey were the following (1) botany mineralogy medicine (2) the diseases medicines remedies etc (3) the air climate seasons periodical rains (4) soil its produce modes of cultivation water works tenures of land (5) the various descriptions and classes of natives their customs languages manners etc (6) animals wild and tame and (7) revenues and population [Phillimore 1950 92]

On Mackenzie's suggestion Hyne the company's botanist on the Madras establishment was given charge of the Sultan's garden at Bangalore in 1800 which was then appropriated as a botanical garden as the depository for useful plants sent from different parts of the country Hyne was instructed as follows

> A decided superiority must be given to useful plants over those which are merely recommended by their rarity or beauty and it will be Doctor Hyne's primary care to attend to such as may furnish any facility in the supply of food or forage to collect with care all that is connected with the arts and manufactures of this country or that promises to be useful in our own to give due attention to the timber employed in the various provinces of his route and to the possibility of introducing the growth of useful trees into such of our provinces as are deficient in that necessary produce and to collect with particular diligence the valuable plants connected with his own profession [Phillimore 1950 113]

Among the reports submitted by Hyne while attached to the Mysore survey were Meteorological journals from March 1800 to March 1802 and a Memoir on Copper Mines near the Ongole district in the Lower Carnatic He published an account of his work in Mysore in his *Tract II Statistical Fragments on Mysore* In 1800 Francis Buchanan was appointed 'to investigate the state of agriculture arts and commerce in the dominions lately acquired from Tippoo Sultan [Phillimore 1950 113] He toured through Mysore and Malabar in 1800 and published his well known account of *A Journey from Madras through the countries of Mysore Canara and Malabar* in 1807

It was also proposed that the superintendent of the Mysore survey dedicate as much of his time as possible to institute a series of enquiries into the statistical history of the country Mackenzie also recommended that the agricultural survey should be executed separately after the first part to avoid the hazard of undertaking too much at once of retarding and confusing the whole [Phillimore 1950 93] and indeed that part was never carried out

The plan of the Mysore survey was an important marker in the era of surveying for it laid the groundwork of all the later surveys Mackenzie above all was most obsessed with the idea of ensuring a uniform plan The memoirs accompanying the maps submitted by Mackenzie to the governor in 1803 included information about the situation extent boundaries and contents in square miles of the several purgunnahs the population by castes and houses as no enumeration by census was then possible details about woods jungles and forests and the nature of the soil and in some instances estimates of the gross quantity of cultivated or waste in plains and mountainous lands Mackenzie also indicated then that this pattern would be followed more thoroughly in the surveys of the other districts as well and made every attempt to do so For instance he wrote as follows to one of the surveyors under him in 1804

> The Teak and Sandal Woods in that quarter will also be a particular object of your attention and to estimate their extent quality and etc as far as may be consistent with the health of your party your observations on these Woods will be conducted with your usual discretion [Phillimore 1950 105]

Similarly he wrote to another surveyor on the Kanara survey in 1807,

> if you could contrive to visit the Heads of the Goom and Budra it would be very satisfactory to me to have a minute and particular description of them, especially the state of the water there, and the dimensions of the head springs, breadth depth enquire of the most intelligent Natives of the commencement and duration of the different seasons Rainy or Dry and by what circumstances attended [Phillimore 1950 111]

The existing records of each district were found to be useful for it enabled the surveyors to verify nearly every individual place the actual positions of which were in the course of the survey inserted by their bearings from each other or from some fixed stations Topographical knowledge was not limited to the physical nature of the terrain alone It included information provided from the cusbas on houses, families, castes, tanks and nullahs These were included in the memoir of each district As part of the survey of the ceded districts and later on elsewhere as well Mackenzie collected a number of inscriptions grants and other documents which were to serve as evidences in constructing histories [Dirks 1993]

In submitting his final maps in 1808 he put them forward as the start of an atlas of the southern peninsula noting that no errors from any previous work could come into his surveys as no part of it either in its groundwork or materials was borrowed from any other It may be recalled that in the era of maps based on route surveys information and evidences were culled from diverse sources The Mysore survey served as a model for a series of methodical surveys which were spread over the Madras provinces during the following 25 years and many of them had the further advantage of being directly based on Lambton's trignometrical survey

Simultaneously with Mackenzie's topographical survey in Mysore, there were other surveys in the Madras provinces by the military For instance in 1801 when the Madras army was fighting with the Poligars of Shivaganga, various routes in Tanjore Trichinopoly Tinnevelly and Ramnad were surveyed It is interesting to note that the records often mention that the native guides were considered very useful in exploring the various roads for the military troops, (whether out of fear, ignorance, bribery or the marvel that something new was happening is difficult to decipher from these records!) and they were soon instructed in the principles of geometry and surveying

In January 1804, at the suggestion of the surveyor-general, the governor general reissued the order of 1788 ordering the regular survey of every military route In the republished order the surveyor-general included many provisions on the conduct of professional surveys For instance he noted

> A correct military, as well as Geographical survey should be made of the Route For this observe everything on the Road, or that

it, either from its height or from its position, as of any importance, but particularly Forts, Hill Forts, remarkable peaks, mountains or Hills, Ghats or Passes, Towns, villages etc, Rivers or Nullahs, with their names and noticing the way the stream runs, whether right or left, at the crossing place their breadths and directions as far as visible up and down the stream All Jeels, Tanks and Wells, should be laid down, and the quality of water should be mentioned

You should be particularly attentive to mark the boundaries of districts as often as you cross them, but the information of the Rayuts or villagers is best, as well as for giving the true names of the towns and villages [Phillimore 1950 198]

The military surveys were carried out by the cadets of the Madras Military Institution This militarisation of geographic knowledge was sought to be firmly based on scientific methods The survey by planetable superseded or supplemented Mackenzie's system of theodolite traverse according to the nature of the ground The surveys were on a large scale of four miles to an inch and each pupil reduced his own work to the two inch scale at the end of the season but no immediate attempt was made to compile a map Reviewing the surveys done by the institution several years later Montgomerie wrote

> It is in this faithful delineation of the features of the country that their chief merit consists for in many other respects these surveys are very defective The absence of all Revenue or Political boundaries and the inaccuracy of the names renders these surveys of far less value than they would otherwise have been, and from the carelessness of some of the officers employed the detail in some sections is inaccurately laid down These defects however admit of future correction and it must at the same time be admitted that by far the greater part of these Surveys are with the exception of the Goa and Soonda surveys the best of Indian topography and Geography [Phillimore 1950 129]

The Madras Military Institution closed down in 1816 The surveys of the institution formed a valuable contribution to the geography of South India, especially since they are connected to Lambton's triangulation Their chief defects as noted above were the spelling of names and the omission of administrative boundaries The boundaries of the surveys were disregarded as the objects of the surveys, so as to accustom the students to a readiness and facility in expressing the various features of the country at sight, in reference to military rather than revenue purposes' [Phillimore 1950-96] The standards of accuracy also varied considerably

In 1822 the directors decided to start an atlas of India to cover the whole country on the quarter-inch scale, and called on the surveyor-general to send reductions from all the surveys fit for incorporation The sheets were engraved in London as material became available and formed the standard map of India for the next 80 years It was decided that only those of the surveys that were linked to the trigonometrical survey were considered to be final Though Colin Mackenzie's survey of Mysore was not grounded on the great trigonometrical survey it was also considered final Much of the early revenue surveys were thus disqualified Everest very much doubted the mapping value of the old surveys even when connected up by the new triangulation And in some regions even though topographical surveys were based on triangulation these were not linked to the trigonometrical survey and the quality of such work was often poor For instance Jervis's survey of south Konkan was considered of poor quality though his statistics and reports were useful Even though he had attended a course with the Ordnance Survey in England and often referred to the works of Laplace Roy and Lambton the maps he compiled did not qualify to be included in the Great Map of India that is the quarter-inch atlas There were also a number of surveys going on that were not linked to the great trigonometrical survey in the late 20s but nevertheless yielded useful information on unknown territories Often in those cases sketches were accompanied by detailed field books' Burnes' survey of southern Rajputana is presented as a sketch entitled Geographical Index to the Map of Southern Rajputana constructed in 1829-1830 and is accompanied by a field-book which is indicative of the style in which he worked For instance he noted

> By 2 pm the survey of the morning figures on the map and the latitude is determined to correct it when a party of two three or four, villagers are invivted into my tent to talk till within half-an hour of sunset I ask the distances of all the villages around within ten miles the road to each and the cross distances of one to another which I sketch roughly on paper without any regard to scale but which greatly facilitates the survey In the evening I take the angles to all hills and towns in sight of my encampment and also a series of bearings to such as are beyond view by guess on the direction being pointed out by a villager [Phillimore 1950 132]

During Everest's visit to England between 1825 and 1830 he persuaded the authorities that the trigonometrical survey should take priority over all other surveys in India On his return he decided to devote all his attention first to the completion of Lambton's Great Arc and then to subsidiary triangulation on which future surveys should be based and which would also tie up such old surveys as were fit for the quarter-inch atlas The making of new surveys without the control of the great trigonometrical survey was not considered favourably by Everest but since the government was impatient for up-to-date maps, it appointed a non-professional committee to conduct map-making policy at Calcutta This committee proposed the compilation of maps from old surveys without any regard to the regulations for the quarter-inch atlas of India Everest launched a protest and it was then resolved that the responsibility for map making would be only with the surveyor-general

V

Trignometrical Survey: Grid of Precision and Rhetoric of Accuracy

The purpose of a trignometrical survey is to provide the lines of latitudes and longitudes using trignometrical calculations from the Greenwich base meridian rather than the earlier determination of latitudes through astronomical observations Even before the Greenwich base line ushered the great trignometrical survey surveying by the method of triangulation was considered superior and Michael Topping was one of the early advocates of triangulation in the early years of the 19th century The method entailed fixing a base point and then carrying forward a series of triangles in different directions the base lines were to be done by actual measurement This was considered a superior way of unambiguously fixing the places

Lambton submitted in 1799, after Mackenzie received his orders for the Mysore survey his Plan of a Mathematical and Geographical Survey which was approved in 1800 In it Lambton noted

> In a former communication I took the liberty of stating my idea of a survey to be extended from the Coromandel to the malabar Coast with a view to determine the exact position of all the great objects that appeared best calculated to become permanent geographical marks facilitating a general survey of the Peninsula and particularly the territories conquered during the late glorious campaign The Surveyors of particular districts will be spared much labour when they know the position of some leading points to which they can refer because when these points are laid down in the exact situations in which they are upon the globe all other objects will also have their situations true in latitude and longitude I have now adduced the principles of my intended survey which involve many more objects than what immediately appertain to Geography Whenever a cooperation with Captain Mackenzie can be dispensed with I shall then direct my views to the General object of determining the Geographical features of the Peninsula [Phillimore 1950 234]

The essential features of Lambton's proposals were 'that his survey should be based upon 'correct mathematical principles' that it should extend right across

the peninsula and be capable of extension in every direction, and that it should form a reliable basis for all other surveys At the same time it sought to accomplish something more sublime viz, to determine by actual measurement the magnitude and figure of the earth which was then considered of great importance for physics and astronomy Lambton noted

> Should the earth prove to be neither an ellipsoid nor a figure generated by any particular curve of known properties but a figure whose meridional section is bounded by no law of curvature then we can obtain nothing until we have an actual measurement [Phillimore 1950 251]

Between 1802 1815 Lambton covered the whole peninsula south of the Krishna river with the exception of a few small areas along the western ghats with a network of triangles He fixed the geographical position of several thousand prominent points and compiled a general map of the southern peninsula south of Mysore He observed in arc of the meridian stretching from Cape Comorin to parallel 18 degrees the longest geodetic arc ever measured so close to the equator and he computed his results and published them

In 1812 Lambton received new values of the earth s figure from Europe giving ellipticity as nearly as 1/304 These induced him to recompute the whole of his great central arc up to Gooty Then after he had extended it further to Bidar to an amplitude of nearly 10 degrees he worked out his own constants and in 1818 recomputed the whole arc again In 1821 on receiving from England the report of the parliamentary committee on the standard of length and Kater s reduction of Cary s brass scale to that standard he set to work to readjust all his computations and derived final values Owing to its great length and proximity to the equator Lambton s measured arc became an important contribution for all later investigations of the figure of the earth more especially in those deduced by Everest and Bessel

The publications of the Asiatic Society generally known for promoting scholarship under the rubric of Oriental Studies also served as an important avenue to propogate the results of the scientific researches going on then The report of Lambton s meridional arc in the Carnatic was submitted in October 1803 one copy being passed to the Asiatic Society at Calcutta and published in the Asiatic Researches The second report 1807 1811 was submitted in February the *General Map of the South Peninsula* having been submitted with a memoir in December 1810 Accounts of the geodetic work were published in Asiatic Researches and an abstract of the measurement of the great meridional arc appeared in the *Philosophical Transactions of the Royal Society*

Everest joined the trigonometrical survey in 1822, and ran a chain of triangles westwards towards Poona and Bombay In 1828, a more extensive survey was started by Boileau from Allahabad, he ran a traverse through Kanpur to Delhi and Agra, incidentally correcting an error in the longitude of Kanpur which had persisted since that fixed by Reuben Burrow in the mid-18th century In planning these surveys Hodgson aimed at a system of co-ordinated and intersecting traverse lines, controlled by regular astronomical observations as continuous triangulation was out of question Neither the Deccan nor the Konkan survey was of very high standard, and both lacked the accurate control that would have been given had Everest s longitudinal branch of triangles been continued to Bombay In 1827 Jopp obtained the surveyor-general s support for a trigonometrical survey on scientific lines and Robert Shortrede famous later for his logarithm tables started triangulation from a base measured just above Khandala ghat on the Bombay Poona road His work was not however in any way comparable with that of the great trigonometrical survey and was stopped by Everest s orders in 1834

The work which was executed before 1830 though of value for geographical and topographical purposes ceased to be of value for geodetic requirements and shared the fate of all similar operations which were executed contemporaneously in other parts of the world The operations prior to 1830 may be briefly described as the construction of a network of triangulation over southern India grounded on and verified by chain measured base lines Through the middle of the network a chain of principle triangles was carried in a meridional direction the angles and base lines of which were measured with greater care than was done on the surrounding network to obtain a determination of the figure of the earth for the calculations of the latitudes and longitudes

1830 is considered an important date for the Indian surveys for it marks the triumph of Lambton s great conception the subordination of all surveys work to the one master survey the great trignometrical survey which was to facilitate ascertaining the geographical features of a country upon correct mathematical principles [Phillimore 1950] Several new instruments such as theodolites astronomical circles and the Colby base line apparatus began to be received from England, where they had been constructed under the superintendence of Everest With the new equipment new systems of observation and new methods of reduction were introduced Though making no major contribution to the theories of geodesy as a science Everest introduced important innovations in practical procedures in the field

The immediate task of the great trigonometrical survey was the provision of points over the whole country to form a reliable basis for topographical and other surveys and maps Measurements and observations had to be taken, and results worked out with all the refinements of geodesy and niceties of mathematics The completion of Lambton's great meridional arc as the backbone of the whole system was Everest s first task The measurements of the base lines and the observation of the principal triangles were to be completed The determination of meridian by astronomical azimuths and the observation of zenith distances whereby a definite amplitude of arc could be expressed in linear measure was the next task Initial values for latitude and longitude had to reinvestigated and the ruling elements of the figure of the earth decided upon before tables of geographical co ordinates could be drawn up

His final computations are given in his *Account of the Measurement of Two Sections of the Meridional Arc of India* drawn from the material contained in *Ms General Report 7* and published by order of the directors in 1847 These values for the figure of the earth are described as Everest s Constants 2nd set and have never been widely accepted His first set published in 1830 had already been generally adopted for Indian purposes and was considered to be sufficient

Like Mackenize Everest was obsessed with accuracy and uniformity For instance he instructed all officers on first starting out to acquire the habit of

> extreme care in taking observations and undeviating regularity in registering them and omit no opportunity of scrupulously examining every individual observation taking the means of all the micrometer readings and deducing each angle The sun never should rise and set twice on an unexamined angle book

And he sent out a circular calling for

> the strictest uniformity in all operations whether as regards observing registering, or computing Until my consent is obtained no innovation on prevailing methods can be permitted [Phillimore 1950 92]

Everest s obsession with 'accuracy' and uniformity was of course part of the 19th century rhetoric of apprehending the world within a framework of scientific rationality But it was not that scientific interests brushed aside the other cognitive interests of colonial rule Everest for instance, asked all his surveyors to make collections of specimens One of his surveyors recorded the following observation

> With regard to the Geological Survey it is impossible to say of what advantage it may prove to be in a mineralogical and commercial way But lately only I have discovered inexhaustible stores of Carbon-

[illegible] by crystallisation, and which a commercial gentleman is now trying to introduce into the market in England A supply would be invaluable, just when the supply of sulphur required for its production in England has been cut off, while pure salt can be here produced for a mere nothing [Phillimore 1950 101]

There were also many times the conflict between fulfilling scientific objectives and administrative objectives For instance, long before Everest completed the field-work of the great arc and before he completed the computations, he was pressed, both by the directors in London and the government of India, for approximate geographical results to be used for mapping purposes instead of waiting the 10 years required for complete verification

In July 1840 the survey committee at Calcutta complained that the surveyor-general's office in Calcutta was not in possession of a complete set of triangulation of the grand trigonometrical survey and that without that document it was not possible to compile any maps in the correct manner Everest was asked to submit by the surveyor general s office a copy of all that has already been made out Although Everest was of the opinion that in all trigonometrical operations a complete map was the last task in the performance and that it ought not to be done until the whole of the topographical materials have been worked up the surveyor general s office on the contrary felt that no high precision was necessary for mapping purposes

VI

Revenue Surveys: Indigenous vs European Methods

The object of the revenue surveys was to determine the size, the productive potential and the nature of ownership claims to landholdings It is not surprising that such an endeavour should have generated considerable controversies relating to measurement practices and revenue settlement procedures In particular unlike the topographical and trignometrical surveys which entailed the application of modern scientific principles and measurements, the conduct of revenue surveys brought forth to the forefront the conflict between the indigenous methods and the Europe in methods In the Bengal presidency indigenous methods for land measurement and assessment of revenues were used, and it was decided to adopt a permanent settlement, i e the decisions made in 1793 for assessment was to be permanent for all time In the Madras presidency the first tendency was to form such a permanent settlement with the leading zamindars But in most parts of the presidency only small landholders prevailed and it became necessary to think of a different mode of revenue settlement This brought to debate the manner of conducting revenue settlement

With the defeat of Tippu Sultan in 1792 Alexander Read was sent to conduct the revenue settlement in those parts Read was able to demonstrate the possibility of detailed settlement directly with the ryots for a period of years Read's method entailed field measurement by 'amins working under Indian supervisors and European officers Thomas Munro one of Read s assistants is said to have perfected the methods of Read when he took charge of the survey of the ceded districts in 1801 1807 Munro s contribution to surveying have been considered noteworthy

It was however on the Bombay side that the first successful revenue surveys were carried out by European methods In 1810 a survey of fruit plantations was begun which was taken over by Dickenson as revenue surveyor in 1812 During the next eight years he is credited to have completed an accurate land survey of the whole of Bombay and Salsette islands Besides the exact measurements some of which were carried out by Indian measurers Dickenson and his assistants all military officers compiled a complete register of land tenures and a classification and valuation of crops His survey was based on triangulation and traverse and he also produced maps and records based on his surveys

So far the distinctive features of the early revenue surveys have been highlighted briefly In what follows I will highlight the debates surrounding the practices of measurement and the conduct of the revenue surveys in the Madras presidency While there are certain common and recurrent themes in the debates in the different presidencies and it would be interesting to consider both the commonalities and the specificities of debates in the different regions I have for purposes of expository convenience limited it to the Madras presidency

Efforts of Read and Munro

Alexander Read was appointed in charge of the regions known as 'Ballagaut ceded by Tippu Sultan and in January 1792 he sent the first report of the settlement work he had carried on in the Kolar district The report is a very interesting testimony of how an unknown territory was sought to be known in a short span of time for revenue purposes I shall highlight some of the salient features of Read s reports from Ballagaut [1] First Read opens with an account of how the inhabitants of the region have become distrustful both of the Company s and Tippu's people, in particular the 'aumildars of Tippu were rapacious and so the people had locked the gates of the villages and would let people in only if they apprehended force, which made Read deploy the Company troops over them as well as experienced official people to gain 'every requisite information of their affairs This is of course the most direct and obvious use of force in the acquisition of knowledge He notes:

> My first measures therefore were to raise *subhinds* peons and appoint such men, as I could find qualified for the employ, *serristadars* to every district to dispense *cowle* to encourage the inhabitants to seek under the company s protection to take Revenue accounts from the provincial registers and to assess them for supplies
>
> I next entered upon an enquiry into the system of Polity and Finance in Ballagaut, for though it be generally the same throughout India there is a difference in every two provinces and a material one in the two Carnatics a knowledge of which I found essential in every revenue transaction
>
> While occupied in this undertaking and waiting the information my serristadars were collecting and my professional vocations proved of service to my new department, for by directing my researches to the discovery of *sirkar* papers at the captures of *Bahamunghur* & *Kundy Droog* I fortunately secured at those places the records of the districts under me which serve to check and to complete the amounts given in by the zamindars and village registers whose interest is to mislead and to conceal whatever relates to the affairs of the country a truth I daily experience being obliged to draw from them by stealth and by perseverance every point of information [Read 1792].

To reestablish order Read found it necessary to make a political survey of the districts under him and to enforce some regulations of the late government's and to make others suitable to the present time He drew up a code for the information and guidance of the Company's aumildars in Ballagaut These related to a whole range of issue that would make revenue assessment and revenue collection efficient for alien rulers who had to first familiarise themselves with the local practices These related to tables of exchange for regulating the aumildars accounts with the farmers and the exchequer tables of weights and measures for regulating the quantities and prices of grain and other articles of supply required for the sirkar a calender of the current revenue year in Ballagaut showing its correspondence with the present and ensuing years of the Christian era specifying the terms of leaseholds granted by the late government and directing them to be considered valid by the company s aumildars; particularising the proportions of money rents and rents in kind of dry grains, prohibiting any deviation from ancient usage specifying government s and the farmer s share of wet grains according to the

banks required for watering them, with the like injunctions to be guided by custom, requiring that pecuniary aid may be given to the contractors for keeping reservoirs of water in repair directions respecting the reservoirs of water, the expense of which is defrayed by government, rules for renting betel leaf, betelnut, sugarcane plantations and coconut topes, injunctions to aumildars to regulate their collections by the rules of every 'sunnad', as they are found to vary from one another, requiring the aumildars to reimburse themselves the losses they may be in danger of sustaining, by an increase of ploughs, and not by oppressively assessing the inhabitants, to ascertain the quantities of 'gur' that can be processed in every district for the use of the army, similar orders respecting bullocks saddles and gunnies prohibition of collecting any road customs, regulations respecting the effects of people dying without heirs, directions concerning the property of people in the Envoy's service or belonging to the army orders about clearing the country of the numerous bodies of thieves that infest it, and orders respecting fines

In March 1792 Read was also appointed collector and manager of the Company's revenues in the ceded districts of Baramahal and Salem and his letter of appointment explicitly required him 'to inspire confidence among the inhabitants of the just and moderate intentions of the English Government [*The Baramahal Records* March 31, 1792] He was to enter on the office in the best possible manner prepared with such authentic information as can be gathered together respecting the real annual produce of the Districts and for that purpose was to provide himself with such number of accounts and subordinate instruments from amongst the natives on whose integrity you can place reliance' [*The Baramahal Records* March 31 1792]

In the initial year, settlement was at the level of districts or small portions of it, and no survey of them were undertaken though in Read's instructions to his assistants he carefully noted the Hindu calender year, the revenue calenders then prevailing in the districts, the cropping seasons of the dry and wet grains, and for other crops as well and the prevailing tax and customs system all what he termed as 'the ancient usage of the country" Leasing by village farms seemed preferable to the revenue board but Read was of the opinion that the value of every farm should be truly ascertained before given in lease, and the paucity of accounts had so far made that impossible though in 1792 Read saw it as a possibility for the ensuing revenue year, based on the accounts of the then current year Read also felt it expedient to lease out farms for five or seven years as it then gave sufficient time to 'survey them [*The Baramahal Records* November 1792]

As Read noted in his letter to the governor-general Cornwallis in 1792, his scheme for the management of the districts was to bring every head of revenue into order, and afterwards to carry it on with a steady eye to improvement thus requiring a perfect knowledge of the affairs as an initial necessary step [*The Baramahal Records*, November 15, 1792] To that end Read proposed a political survey of every district but soon finding that it was a work of many years rather than one incorporated it into a general survey His scheme for the political survey included among others the following

1st Section Inquiry into the prevailing distinctions occupations and privileges of their inhabitants to ascertain their respective places in society, the uses to be derived from each class to the community and a thorough knowledge of their municipal policy

2nd Section Inquiry into their divisions of time, tables of their weights and measures used in different commodities, an analysis of coining, assay and exchange

3rd Section A particular account of every production of these countries illustrated by drawings properly classed and specifying their sowing and reaping seasons the periods they are in the ground average prices their qualities and uses comprehending a thorough investigation of the season and crops

4th Section Inquiry into the various conditions of land rents and tenures and into the various modes and rates of taxation

5th Section History of these countries tracing the origin of institutions in the present system of finance and their effects in successive governments to the present time

6th Section Particular statements of the settlements of every district in 1792 with every necessary information respecting their sale productions and situation, illustrated by a map defining their respective boundaries and places of forts

7th Section Review of the foregoing sections and a mode of revenue management deduced from them by which may be effected equal and legal assessments the same annual receipts to government, and perfect security to the inhabitants against oppression [*The Baramahal Records* Section I, No XX No I]

In filing his report on the progress of settlement to the president and members of the revenue board in August 1794 Read noted that he found that even the most intelligent of the natives were 'partially and 'imperfectly' informed on revenue detail, and that any general plan must be the result of much practical experience and information, which none of them possess' [*The Baramahal Records* Section I, No XXVI] He therefore felt that the 'survey was the only means While Read surveyed Tirupattur, Vaniambadi, and Coonotoor, his assistants surveyed the greater part of four other districts One of his assistant collectors from Kaveripatam wrote to Read in October 1793 that the common practice of appropriating 'sarkar' lands under the denomination of 'Inam' lands could be 'effectually remedied' only by a survey [*The Baramahal Records*, Section I, No XXVI] The idea was to settle every district, village by village, in small farms as the "best method to establish property"

To make it even more 'complete', Read intended to accompany every such settlement of a district with a "copious and correct map" though time and the lack of trained geographical surveyors prevented this accomplishment He therefore had to settle only for a 'sketch' that conveyed the idea of the situation, shape and magnitude of every district sufficiently correctly for general purposes [*The Baramahal Records*, Section I, No XXVI] Again in his letter to Cornwallis in September 1794, Read pointed out that his map though defective due to the method adopted in the survey of them conveys much information that is very useful Read noted that the object of the system projected was to consist in making everything it comprehended 'as distinct simple and permanent as possible [*The Baramahal Records*, Section I No XXVI] The court of directors in its letter to the revenue board dated October 4 1797 appreciated both Read's map of the Baramahal and Salem districts and his survey taking note that it is 'the first of its kind for procuring the knowledge of the real value of any part of the Company's possession on the coast [*The Baramahal Records* Section I]

Munro's Early Contributions

While Read was in Baramahal, Munro was appointed the first collector of Kanara during which period he made a settlement there with the landholders estate by estate based on vernacular records and also made an experimental survey of one village In October 1800 Munro was transferred to the ceded districts covering Bellary, Kurnool, Anantapur and Cuddapah where he instituted a survey and assessment of that country Munro noted that in the ceded districts, unlike that of Kanara there was no private property in land, and land was always regarded as the property of the state He also claimed that accurate records of earlier assessments were not available, though since the time of Haider Ali they were apparently in as complete a form as possible

Munro began a survey of the districts in June 1802 with four 'gomashtas who he claimed were the only ones then who understood land measurement Though it proceeded very slowly at first, the number of surveyors were progressively augmented by training the inhabitants, so that by the end of the year there were about a hundred of them, who could then be formed into groups With the exception of hills and rocks,

all land of whatever kind was measured, including roads, sites of towns and villages, beds of tanks and rivers, and wastes and jungles. The surveyors used everywhere the same standard measure, a chain of 33 feet 40 of which made an acre. Out of this survey Munro evolved a code that was followed during the introduction of the ryotwari settlements in the 1820s.

While surveys and settlements in Baramahal and Salem were initiated in the last decade of the 18th century there was no regular policy for the assessment of revenue in the various districts of the Madras presidency each was dealt by the board of revenue according to local conditions which included past history and the capacity of the collector. It was in 1805 a general principle that the collectors of revenue should proceed with a 'survey of their respective districts'. These settlement surveys were entirely distinct from the more general district surveys entrusted to the assistant revenue surveyors and which were considered untrustworthy for revenue purposes. Remarking on these general district surveys Bentinck noted in 1804:

> How great would the advantage have been in forming either the annual or permanent settlement of our Revenues if the districts had been laid down by men of science precluding the necessity of trusting to the surveys of natives equally liable to error from want of honesty and from want of knowledge (Phillimore 1950: 182).

Except in the Chingleput Jaghire and the Northern Circars where permanent settlements were introduced in most other districts a survey or permish by the native staff was completed before 1808 and these formed the basis of all periodic assessment during the next 50 years.

What is significant in the early debates is how the discourse progressively shifts from placing' reliance on the natives to the natives being equally liable to error from want of honesty and from want of knowledge and how that discursive shift was associated with the introduction of surveys. A case for surveys had to be made out it was not something that was so apparent. Such surveys as would be clear sought to achieve two objectives. On the one it sought to define property relations and on the other it led to a detailed mapping of village plots, which were then fitted into village maps.

From 1818 onwards, the board of revenue sought to introduce the ryotwari system on an experimental basis in the Madras presidency and to that end conducted experimental surveys of a few villages laying great emphasis on measurement and classification of lands, and on assessment procedures. Munro's code evolved at the time of the survey of the ceded districts provided the guidelines. In evaluating the results of one such revenue survey for the village of Covoor in Nellore district, the board remarked on the manner in which measurement methods deviated from the one suggested by Munro. Whereas Munro had suggested that separate numbers be given to fields keeping the distinction between dry, wet and garden lands, the surveyors had numbered the fields serially in their order of appearance without distinguishing between dry wet and garden lands (Company Government 1826). 'Purrumpoke lands that is waste lands never cultivated, were not to be numbered but the different kinds of waste lands had to be stated. Measurement and classification were thus seen to go hand in hand.

The board's Minute further noted that where as the inhabitants showed no inclination either to obstruct or retard the measurement they were reluctant to assist in the classification of lands (*Company Government* 1826). Whereas the classification of lands was to fix the assessment the people of the villages felt that such fixity was not possible for the quantity of produce of each field was unknown means of irrigation often failed and custom had in some places instituted the system of vesubuddy in which cultivators have a joint interest in wet field cultivation and often they did not have the means to cultivate the whole lands.

Wet lands were classified into eight sorts according to the proportion which the produce bore to the quantity of seed sown that is an index of land productivity. Thus land calculated to yield 40 fold was classed as first sort 35 fold as second sort and so on. But as no single whole field could produce forty or 35 fold as a field was often composed of different qualities of soil some more productive and some less productive an average was taken thus rendering the eight fold classification of wet lands into a five fold classification. Dry lands were classed into four according to the quality of the soil. In the case of garden lands whereas the Munro code only specified that betel and cocoanut be also classed as garden doubts persisted as to whether this was true of only tree plantations, and as to whether differentiation with other non cereal crops was necessary or not. In other words whether garden lands be differentiated on the basis of soil alone or whether 'produce and the value of produce' becomes the basis for further classification. Similarly the code for assessment required the correct ascertainment of the produce for each field, which was not possible to obtain either from the accounts of the karnams or of the cultivators. Therefore the quantity of seed each field was capable of receiving, along with the productivity in each class of land was used to get at the gross produce of each field. This was compared with every other account that exhibited the total average revenue and average produce of the village. Thus, the correctness of assessment depended crucially on the correct classification of lands.

In 1822 the board of revenue submitted a report on the extent to which the survey, classification and assessment of the lands had been completed in each district (Company Government 1826) and Munro recorded a Minute on the subject, which the board accepted. Munro noted that different standards of measurment had been adopted in different districts and sometimes even in the same district. He pointed out that the main objects of a survey were to record "the exact quantity and description of all the land in every village to ascertain the tenures and rights of the occupants or owners as well as the rights of Government, to fix limits and by removing doubts to obviate disputes respecting them to establish mutual confidence between the Ryots and the Government by showing each what belongs to it to ascertain the grounds of the assessment not for the purpose of increasing the amount but rather for that of enabling Government to avoid over taxation and in short to make what is now vague and fluctuating definite and permanent" (Company Government 1826).

Munro was not only involved in evolving a framework for the ryotwari system, but as deeply concerned with systematising all aspects of administration. One of the important requisites for effective administration in Munro's view was information. In one instance while arguing the case for including natives in the civil administration who can supply all the necessary information he noted:

> Intelligent collectors are necessary at all times but more especially when it becomes expedient either to raise or lower the revenue. Such an operation requires not judgment alone but great knowledge of details, and if undertaken without these essential requisites would be productive of much mischief. We ought therefore not to be satisfied with a superficial knowledge of the general state of the country but make it a part of our system to obtain the most minute and accurate information concerning its internal condition and preserve and accumulate that information in clear and detailed revenue accounts and statistical statements (Company Government 1826).

While the necessity of accurate measurements of the land and of a more or less exact classification of soils, as the only right basis of a land revenue settlement was acknowledged early on in the Madras presidency, it was not acted upon in the ensuing years. Whereas in most provinces regular revenue surveys were undertaken, in the Madras presidency alone there were no such regular surveys. In some districts of the presidency attempts were made in the earl

years, to establish something like a register of lands, and fixed rates of assessment, founded on actual measurement and valuation. But these measures were considered in the later years as very defective in many respects. The surveyors were under no effectual control; there were no maps, either field, village or talook, and no permanent boundaries; and even the records of the surveys that were done were imperfectly preserved. Hence, even in those districts where the work was the least imperfect, as in the ceded districts, it was realised that few of the advantages of a really effective survey had been secured

But even these defective and imperfect surveys extended to only a few districts; and there were many, wherein the land revenue demand was based merely on the unchecked statement of the karnam. For instance, it was claimed that, in the Canara district during the last 60 years preceeding 1858, considerable waste and forest land had been reclaimed, which was liable to pay revenue to the government, but on which there was no means, in the absence of a survey to enforce that right. In Nellore again, the land revenue arrangements were considered to be in a state of utmost confusion. The settlements of the first collector at the beginning of the century were based on no certain data; and it was believed that they had been tampered with since, such that it was impossible to say to what class any given piece of land belonged, or what was the proper demand upon it. The only thing certain was that very numerous and extensive tracks had been committed and were in operation, which it was admitted only a survey could correct. In the districts of Rajamundry and Masulipatnam both of which were in process of being brought under the influence of extensive systems of irrigation, there was once again no accurate information rendering the levying of a water tax that much difficult [Government of Madras 1858].

The government decided that the revenue survey should be connected by minor triangulations with the trigonometrical survey, to ensure both greater accuracy and permanence. As to its more immediate objects, what was required was a survey for revenue purposes, not a topographical survey. Its main design was to show all the principal variations in the surface of the soil, as whether hill, jungle, roads, channels, tanks, topes, houses, cultivated and cultivable land, and also to exhibit accurately the sizes of fields in the cultivated and cultivable land. For a system of ryotwari field settlements, the sizes of fields require to be accurately determined. It was also decided that the survey should extend to enam lands as well as to government lands; and that the occasion should be taken to investigate the titles of enams, as well as their actual extent. The detailed survey was limited only to the cultivable land, including all ever actually cultivated, with such other land as may seem likely to be brought under cultivation within a few years. The rest of the area of the village, viz the jungle and unreclaimed waste generally, was not to be surveyed in detail, but only in its chief features And as further portions of it were to be successively brought under the plough from time to time, it was decided that they may be surveyed by the survey establishment which was to form a part of the permanent establishment of every district. Lastly, it was considered essential that permanent boundary marks should be established; and that field maps, village maps and talook maps should be prepared.

The government was of the opinion that the survey should be done by the English methods of surveying, as was done in Bombay, and was then being done in South Arcot, and not in the "inaccurate Native Method".

The method proposed therefore stipulated both the size and nature of fields to be covered. It noted:

> The proposal by the Board of Revenue in para 25 of their letter of the 27th February 1854, appears judicious, viz that fields in the survey shall not generally be smaller than one acre of irrigated and two acres of unirrigated land, and that minor subdivisions shall be shown by dotted lines according to the village accounts. Very near the village, where land is valuable and is held in very small plots, it may be proper to relax this rule In Bombay, the smallest fields allowed were much larger, none being permitted under ten acres; and this was not only a detail of the survey, but a part of the revenue system, and if a field were held in partnership, and one of the co-partners died or gave up his part, the other co-partner must take it or abandon his part also, unless he could find someone to take the vacant share. Under this Presidency, where land is almost invariably regarded as property, it would be impossible to enforce such a rule, and the attempt would lead to great discontent, and possibly to popular outbreaks [Government of Madras 1858]

The government was of the opinion that the ryotwari or individual system, should be adhered to generally. They looked upon that mode of settlement as an advancement of settlements by villages, or other communities; and they believed that in the progress of society the latter must give way to individual holdings.

Maps, Mapping Problems and Map Functions

It has already been mentioned that mapping was an important follow-up of the surveys, and it was not always efficiently executed, at least in the case of the early topographical and revenue surveys. At the turn of the 19th century, the published maps of Bengal were considered more defective than the maps of the other parts of the company's provinces. The old engraved sheets of Rennell's survey had gone out-of-date and out of print. Also many regions in the map were still left as blanks. Copies could only be made by hand-drawing, and it was almost impossible for local officials to get hold of maps of their districts In some districts surveys were copied on their original scales, and there was no appreciation that maps on a reduced scale would be useful for purposes of administration. It was still a stage when the function and utility of maps for administration had to be argued out. A district officer in Bengal remarked:

> The convenience of a good map for judicial and police purposes I can speak of from experience. . We know at a glance what officer can most conveniently be employed on any special duty, and we can adjust the proper stations for our police *chokies*. The new settlement of Azimghur is about to commence, but the Collector has nothing on which to found his measurements or surveys, and even the sites of the principal towns are unknown [Phillimore 1950: 275].

Some amount of mapping was done in the early years of the 19th century. In the Madras presidency, the military institution and the district surveys produced some maps though mapping was not given the same priority as surveying. Arrowsmith's first map of India based on information from route surveys was published in 1804 in six sheets on a scale of about 2½ inches to a degree. In 1816 he reissued a new map in eight sheets on a scale of 16 miles to an inch and revised yet again in 1821. The other map of India that was prepared was Reynold's map, but it was generally believed that there were more places laid down in Arrowsmith's map than in the Reynold's map and Reynold's map was never published. Between 1821 and 1823, Hodgson, as surveyor-general sent to the directors in London a large number of maps, journals, fieldbooks, originals and copies, to which the directors responded:

> "...surprised to find that the Collectors and Judicial authorities are not furnished with maps of their respective districts. We are not aware who is to blame for this omission, but we desire that no time be lost in issuing instructions to the Surveyor-General to prepare in all practicable cases maps of the several revenue districts for the use of the local authorities... [Phillimore 1950:276].

The directors also instructed that a map be prepared for their own use showing the boundaries of all the districts as well as the 'sudder' (headquarters) stations. The directors further requested for

> a sketch map of India on a moderate scale, describing the course of the principal rivers, and the situation of the principal cities of the peninsula, together with the names and

positions of all military posts at which more than five companies of troops may be stationed and that the Adjutant or Quarter Master General of the Army may be directed *to insert in words and figures* under each military post the number and description of troops stationed at it We desire that such a map may be transmitted to us annually [Phillimore 1950 282]

When Colin Mackenzie was surveyor-general he was much preoccupied with surveys rather than the prepartion of maps He however laid down the scales for geographical maps as 8 12 24 and 48 miles to an inch A useful geographical map on the 48 miles scale entitled Map of the countries included between the parallels of Madras and Delhi designed to exhibit at one view the capitals of States and of Provinces was compiled in 1817

This map was reproduced in Blacker s Memoir and was incorporated into the 25 mile map of India engraved by Cary in six sheets Blacker was the first to propose a map of southern Asia that was completed some 60 years later An essential condition in his opinion was that the surveys used for his proposed map should have been linked to Lambton s triangulation and at his request an exhaustive report on the surveys of Madras were made Further in order to ensure that all materials should be uniformly prepared ready for engraving Blacker drew out a graticule based on the projection used for the French military map *La Carte del Empire Francais* The surveyor-general issued instructions for the preparation of quarter inch degree sheets on the projection devised by Blacker

Inserting names of villages and towns on the maps was not free of problems either There were rival systems of transliteration of Indian names that of Sir William Jones and that of Gilchrist Whereas in some provinces either of the two systems were adopted in yet other regions some combinations of both were used Though in general surveyors were not particular about the question of orthography as the map-makers were, revenue surveyors were advised to use some fixed principle in expressing native' names Apparently much confusion was experienced with village names, not only from differences in pronounciation and doubtful transliteration, but even from the existence of two or more forms of the same name, or from the use of a name in the official list that was never used by the villagers Colin Mackenzie had instructed his surveyors to follow the lists of names supplied by the collectors, but as Campbell who was in charge of the Salem survey in 1840 noted while preparing his maps that the names of the villages supplied by the collector had to be corrected for spelling which were sometimes very preposterous as "to be totally unlike the real one", and to which the "native Tamil names form no guide" [Phillimore, 1950] Everest was also supposed to have been exacting in ensuring uniform spelling in the maps and charts prepared under his direction He ruled that his topographical surveyors should adhere undeviatingly to the orthography of the names from the Great Trignometrical survey [Phillimore 1950 310] Following the method of William Jones, he was in favour of the introduction of Italian vowels which were considered to have the most definite intonation of all known languages with English consonants into the orthography of all maps and the trigonometrical survey

Also a fixed system of signs had to be evolved and since the early years of surveying this had been a preoccupation For instance at the time of the appointment of Colin Mackenzie as surveyor general in Madras the council of the governor wrote to the directors of the company

> Plans of the nature which I have described cannot be constructed either without great personal exertion or within a short period But although such sketches and remarks must be highly useful where none before existed yet it is easy to conceive how imperfect and even unintelligible such works must often be where no system of drawing and no fixed signs to represent particular objects and features of a country have been established but where every officer pursues a different mode of expressing the objects which he sees [Phillimore 1950 124]

In due course district maps became available from the revenue surveys though the early ones had no trigonometrical control The various general maps published such as the Arrowsmith s and Allen s went out of date Orders for the standard quarter inch atlas of India were first issued by the court of directors in October 1823 and the first published sheets reached India in 1828 Though from their start, the revenue surveys were recognised as valuable material for topographical and general maps and the surveyors were directed to sketch in all the main features of their village areas to that end, they could not be accepted for the atlas of India until they were linked up by the trignometrical survey The atlas occupied 177 sheets each 40 inches by 27 and on a scale of 4 miles to an inch For the first sheets of the atlas materials were furnished from the Madras topographical surveys, and it took nearly 60 years for the atlas to be completed

It was from around the 1830s onwards that a large number of maps to suit different purposes were produced For instance, in 1833 Parbury and Allen issued in a book form a set of five small maps of India that were "illustrative of the European connection with India and of the British administration in its several departments" These were the general and commercial map, the political map of India with a list of states and chronological table, a military map showing stations occupied by troops, revenue maps showing districts but no roads and few place names and a judicial map Further to illustrate Thornton s *History of India*, they ussued a smaller map appropriate to the periods of each volume A second edition with five additional maps were brought out in 1848 These were however, still only skeleton maps

It was with the series of illustrative maps by E A Prinsep the settlement officer in the Sealkote district of the Punjab in 1863 that maps as an instrument of knowledge acquired new epistemic heights, a feature that was undoubtedly being constantly developed as we have seen for nearly a hundred years since Renell's maps Prinsep s *Statistical Account of the Sealkote District* contains maps showing the agricultural tribes arranged according to occupancy of land political and fiscal divisions rent-free aspect of the district physical features and zones of fertility different kinds of soils acres under different kinds of produce police divisions; statistical aspect of area, agriculture, and population and prevailing tenures and modes of assessment [Markham 1871 273] In 1870 Prinsep published yet another series of maps all relating to irrigation aspects of the district

For each presidency there are at least three sets of maps – the presidency maps, the district maps and the village maps, and in some instances the taluk maps as well It is noted that in 1871 from the Madras presidency alone four districts maps, 17 taluk maps, eight maps of parts of Madras town 76 plans of Wynaad coffee estates, and 5650 village maps were sent to the geographical department of the India Office [Markham 1871 134]

The era of geographical and topographical surveying also ushered numerous other surveys on the botany, geology, forests and other natural resources as well as on the antiquities and archeology Though population was not the object of concern in these surveys it has been noted that right from the early surveys of Colin Mackenzie, population and its characteristics figured in the statistical surveys to some extent By the mid-19th century, population became an explicit object of concern, and this moment of surveying and mapping was extended to the population as well From surveying and mapping territories the epistemological concerns and administrative requirements shifted to mapping populations

Notes

[I am thankful to the staff of the Tamilnadu Archives (Madras) the National Archives (New Delhi) the library of the Asiatic Society (Calcutta) and to Rama Debroy of ISI (Calcutta) for helping me in acquiring the material on which this paper is based]

1 For a lucid account of how the project of geography and history in colonial India particularly with reference to the work of Colin Mackenzie were linked and the politics associated with the writing of new histories and the denial of historicity and the erasure of the histories of the colonised read Nicholas Dirks (1993)

2 There is indeed a very interesting chapter on the Akbari Measure of distance called The Karoh or Kos in Abul Fazl Allami (1989) It notes that directions were issued by Akbar for the ascertainment of distances and their determination by the standard measure of the kos The kos was fixed at 100 tanabs each consisting of 50 Ilahi gaz or of 400 poles (ibans) each pole of 1¾ gaz to the kos It further notes that whenever Akbar travelled the distances were recorded in pole measurements by careful surveyors and their calculations were audited by the superintendent and inspector The chapter also contains evidences on the diversities of measurement the problem alluded to by Rennell It notes that Sher Khan fixed the kos at 60 jaribs each of 60 Sikandari gaz which measurement was employed in the Delhi country In Malwah it consisted of 50 tanabs of 60 gaz each and in Gujarat called the cawas kos that is the greatest distance at which the ordinary lowing of cows can be heard which is put by experts at 50 jaribs In Bengal it was called Dhapyah which is the distance that a fast runner can traverse at one breath It further notes that some assert that the dhapyah is the distance within which a green leaf placed on the head of one who walks rapidly will become dry Some measure by the steps of a woman with a water pot on her head and carrying a child in her arms reckoning a thousand such steps to a kos The chapter also contains a footnote on the length of a kos fixed by Babur It appears that this note has been inserted by Jadunath Sarkar who was the editor for this edition of the book

4 Concurrent with Lambton's trigonometrical survey in India there were surveys done in other parts of the world France was in the vanguard under the leadership of Cassini family in the early and mid 19th century National surveys of comprehensive triangulation measurements then followed in Denmark and England For more on these read Sven Widmalm (1990)

Industrial Growth and Stagnation

Edited by

Deepak Nayyar

A selection of essays presenting the main strands in the debate on industrialisation in India The contributors analyse the factors underlying the deceleration in industrial growth from the mid 1960s to the mid 1970s and discuss the conditions and policies for a return to the path of sustained growth Alternative hypotheses about the macroeconomic determinants of and constraints on industrial growth in India are examined focusing on the performance of the agricultural sector intersectoral terms of trade between agriculture and industry disproportionalities within and between sectors the level of investment in the economy the nexus between public and private investment and the relative significance of supply and demand constraints

Poverty and Income Distribution

Edited by

K S Krishnaswamy

While there has been, over the years, a perceptible increase in per capita income and expenditure and possibly some decline in the incidence of poverty in India, what still remains is massive and of a kind that is not remedied quickly or smoothly Even with radical policies, the shifts in income and occupational structures to make a serious dent on it will take more than the rest of this century In the welter of recent exchanges between the government and the opposition as well as between planners and market advocates on the strategy of growth, these issues have been largely obfuscated It is therefore more than ever necessary today to recognise the magnitude of the problem and the inadequacy of the measures adopted so far to deal with it

Technological Slips between the Cup and the Lip

Unlearnt Lessons from Inter-War Colonial Madras

Nasir Tyabji

The establishment of the Government Industrial Institute in Madras in 1919 coincided with the development of chemical engineering as a distinct discipline at the Massachusetts Institute of Technology. It would thus be unhistorical to expect that readymade chemical engineering expertise would have been available to the Industrial Institute. However, other problems at diverse levels, raised by the history of the Institute, remain unresolved to this day: the provision of venture capital, infant technology protection, and plain incomprehension of the issues involved. The case of the Industrial Institute clearly forms the prehistory of more recent lunges at self reliance.

I
Introduction

It is well recognised that the technological base underlying German industrialisation in the late 19th century was provided by the chemical industry in contrast to the leading role of textiles in English industrialisation a century earlier [Schorsch 1980: 401-17]. Recent scholarship has added to the understanding of the ways in which nation states which industrialised even later depended on the utilisation of successively more modern generations of technology, the case of electronics in Japan being the most dramatic.

Very recently, analytical work has enabled scholars to understand how American technology in the chemical industry managed to surpass German efforts in the field during the first two decades of this century [Landau and Rosenberg 1992: 73-119]. Apart from the obvious disabilities that Germany faced after the first world war, two key issues have been identified. These are the development of the chemical engineering discipline largely at the Massachusetts Institute of Technology in the US, and the switch from coal to petroleum as the basic feedstock which decisively moved the raw material advantage in favour of the US.

It is the first issue that is relevant to the analysis of the situation in colonial Madras. Essentially, the point is that while expertise in applied chemistry is important in developing processes for industrial applications, the development of large scale plants for commercial use of chemical reactions requires specific technological knowledge. This is the core of chemical engineering. Although Germany had a distinguished tradition of applied chemical research in industrial establishments, the actual plants were designed and fabricated by mechanical engineers, in contrast to the situation in the US.

This factor does not appear to have been appreciated by the members of the 1916 Indian Industrial Commission (IIC). Although Alfred Chatterton, a distinguished technologist and the initiator of attempts to develop the chemical industry in Madras was a member, the distinction between applied chemistry and chemical technology, and the critical importance of the latter in generating commercially viable plant and equipment seems to have eluded IIC. The discussion which follows uses this hiatus as an explanatory device to organise the empirical details of the inter-war history of attempts to develop the chemical industry in Madras.

The historical importance of these rather patchy efforts lies also in the fact that objectively they contradicted the logic of imperial fiscal policy. As is well known, this logic discriminated in favour of the export trade in primary commodities as opposed to the development of industrial production. In this paper it is exemplified by the effects of the two Retrenchment Committees which collectively sealed the fate of the initiatives described.

II
Experiments with Fluid Inks

The department of industries and administrative support to industrialisation had started in Madras in the early part of the century. After fairly substantial progress had been made in demonstrating the possibility of manufacture of a range of articles, the department was abruptly asked to close down its activities. This order by the secretary of state for India followed protest by British manufacturing interests on the ground that the government was thus going beyond its natural functions.

With the closure of the department of industries in 1910, the focus of attention moved to the department of fisheries under the honorary director Frederick Nicholson. It was here that examination of the possibilities of fish oil, and then of coconut oil took place, leading to the establishment of the Kerala Soap Institute in 1916 [Hyderabad].

This Institute had by the end of the decade shown the technological and commercial possibilities of soap production from coconut oil on the west coast of the presidency. Hydrogenation of the oil started by the Tata Oil Mills (TOMCO) factory in Ernakulam represented a further stage in the industrial application of the edible oils of the presidency, and these two developments characterise the beginnings of chemical technology in southern India.

The Madras government was allowed to restart the industries department under very specific conditions in 1914, and during the first world war, in effort was made to encourage simple industrial activities, particularly for the war effort. Even before the end of the decade, however, another institution had been set up again at Frederick Nicholson's initiative, which showed every sign by the end of the 1920s of taking technology to the next stage. This was where both the mineral and oilseed base of the presidency would have been used, in combination to produce ink for printing purposes, paints and similar substances. Ultimately the enterprise failed under the remorseless logic of retrenchment cut-backs in 1932, but in the process it managed to commercialise processes of manufacture of writing ink and printers ink. The other experiments were aborted by the same pressure of expenditure squeezes.

When Nicholson asked in 1919 for the services of a chemical assistant for what was then called the industrial laboratory, he had suggested that experiments could be undertaken in the manufacture of vinegar, inks, adhesives, specialty toilet soaps, and in the extraction of volatile oils and essences. These were characterised as experiments in the minor chemical industries suitable for the presidency, and the proposal was passed without any difficulty.

Even before the end of 1920, ink was successfully produced from material said to be easily available but unused for any industrial purpose till then. Some progress was also reported on the experimental manufacture of adhesives and vinegar. On the basis of these successes, the chemical assistant's post was extended for five years, i.e. up to 1925.

The technical development of the ink was, in fact, complete and the task lay now in

demonstrating its successful commercial manufacture. Research on vinegar and adhesives was still in the experimental stage where, amongst other items, the use of casein for adhesives was being investigated. As Venkataraman Iyer, the chemical assistant, had been appointed for five years Nicholson's proposal for a block extension of the laboratory for the remaining four years was also agreed to, support for this coming from the minister for the development department.[8]

These measures should have added a degree of stability to the Institute's development work, but quite the opposite happened. In March 1922, Nicholson left for England and Venkataraman Iyer was placed in charge of the experiments. Although the Institute's activities were moved to Madras in October 1922, the possibilities of continued supervision of the work by a senior chemist were seriously reduced by the instructions of the first retrenchment committee, that the post of chemical advisor be abolished. Although the government continued the post up to the time the then incumbent retired in 1925, the career prospects for chemists in the government's service did not look promising. The retrenchment committee suggested that greater use should be made of the expertise of the Indian Institute of Science in Bangalore, a logical step in terms of the scale economies of experimental work, but raising a new set of problems, to be discussed later.

The retrenchment committee in fact, argued that as the technical possibilities of the manufacture of writing ink were proven, the Institute, now renamed the Government Industrial Institute, should be closed. Fortunately, printer's ink had recently been granted tariff protection and the finance secretary's suggestion that the Institute should develop the manufacture of this more complex chemical provided an authoritative case for its continuance. Even otherwise, the commercial feasibility of manufacturing writing ink was still to be explored.[9]

In early 1924 this task was completed with the reported agreement of the superintendent of stationery, Madras to buy the ink and the submission of tenders to the Government of India's controller of stationery and stamps in Calcutta. There were also prospects of sales from the Madras and south Mahratta railways, district boards and municipalities. In addition, Taylor and Company of Madras, major importers of ink, were appointed sole agents.

Although the government hoped that by giving this company the sole selling agency they would overcome the unwillingness of dealers, presumably associated with Taylor and Company, to stock the ink, this move did not succeed. Sales were not noticeably higher than in the years before the agency agreement and, as such sales as there were, were to government departments, the rationale for paying Taylor and Company a 5 per cent commission on even these orders was questioned by the audit organisation. It was explained by the director of industries that this payment should be treated as a necessary cost of entering the ink market when imported brands held dominant sway, but the continuing poor sales of ink except to the government itself did not lend much credence to the argument.[10]

Essentially, the problem lay in the fact that while the IIC had provided legitimacy to the role of government in pioneering industry, through the stages of technological and then commercial feasibility the government had not committed themselves to the financial implications of these measures [Government of India 1918].[11] The philosophy underlying the formation of the retrenchment committee was, in fact, directly opposed to subventions and subsidies for developmental purposes, at least in the field of industry.

In general, 1925, was a turning point in terms of the prospects of the industrial enterprises run by the government. In that year, it was decided that with the provision of state aid to industry, government's efforts would be devoted to laboratory work while experimental production, let alone commercial organisation, would be left to private enterprise.[12] Such a policy also had implications for the continuance of Venkataraman Iyer, in his role as an applied chemist involved in laboratory work. For it was then a small step to argue that laboratory work itself could be more efficiently done at the Indian Institute of Science. What was missed out here was that the stage of demonstrating that a process developed in the laboratory could be scaled up to produce a commercial scale technology was not, and could not be, the responsibility of the Institute of Science. On the other hand, the state aid to industry act was also not designed to provide the sort of venture capital that financing the development of technology essentially represented.

More immediately the challenge to the claims of the Industrial Institute to have produced a commercially viable ink technology came from the superintendent of stationery. This office refused to buy the special purpose registration ink, used on documents, on the grounds that it was available more cheaply from private sources. In that instance a determined effort by the minister for development succeeded in getting the order for the Institute on the grounds that its inks were of superior quality not testible by normal government standards, and essential for documents of long term importance registered with the inspector-general of registrations.[13]

The director also argued that no quality standards were laid down beyond the minimum required to pass the test of the chemical examiner which was purely concerned with the composition of the ink, rather than its qualities as a writing medium and its permanency.[14] This, though a valid point if the ink factory's products were of higher quality, was not pressed further in the direction of the laying down of general standards. If the government industrial establishments were indeed to demonstrate the manufacture of products of exemplary quality, this is clearly a step that should have been initiated. In fact, there is little doubt that professionalism in industrial management was seriously lacking.[15]

However, the long-term indications were that there were attempts at dumping by private ink dealers so as to undercut systematically the ink factory's commercial prospects. These dealers appeared to be both Indians and Englishmen. Under these conditions, the government did not agree to sanction the extension of the institute and staff for more than one year at a time and for the remaining seven years of its existence, they worked on the basis of the uncertainty which was inevitable from then on. By the following year, i.e. 1926-27, doubts about the feasibility of extensions of the term of Institute had spread from the finance department to the secretary of the development department, himself. Interestingly, however, the Indian members of the legislative council on the advisory committee on industries and fisheries asserted themselves. A far-sighted proposal, emanating from the secretariat also suggested that the Institute should have a scheme of apprenticeships. Here was the realisation that in the short and medium term, greater political support could be obtained for a scheme of employment-related training, than for any effort at import substitution industrialisation by itself.[16]

The scheme for training apprentices began in July 1926, initially for Folders of the SSLC with a background in Chemistry. Four apprentices were to be admitted for a two year course. When, after some dithering, advertisements were placed it was found that there were no applications. On investigation, it was found that the advertisements had appeared in the English press, which did not have the readership likely to be interested in training in a skilled manual trade. The minister for development suggested that fresh advertisements should be placed in the Indian language press and wished to vet the text himself. This development took place after an intervention in the legislative council.[17]

Unless the Institute was to show its long term utility by being successful in training apprentices, it had to demonstrate the commercial viability of ink manufacture and then be transferred to a private entrepreneur. Achieving commercial viability had become difficult with the uncompromisingly commercial orientation shown by the superintendent of stationery towards ink supplies. Of course, this was his job. It was certainly not his concern to take cognisance of the fragile financial status of the ink factory. But with the post 1925 policy on

government industrial enterprise, it was not possible for anyone in authority to develop procedures to handle such situations Recourse had to be taken to *ad hoc* solutions This probably reflected itself in uncertainty about the prospects of the industry and the demand for apprenticeships [16]

Proving commercial viability was an equally complex task Securing regular and large orders from the superintendent of stationery was critical if the ink factory was to be seen to be successful by potential purchasers This meant that not only was the ink to be of acceptable quality and price, but the tender had to be such as to be able to withstand dumping as mentioned earlier However, there were no provision by which a government institution could lower prices beneath those of costs of production so as to be able temporarily, to withstand this pressure Only if the office of the superintendent of stationery accepted its own role in pioneering an industry and granted price preference, could this problem be overcome Otherwise sales below cost would have been interpreted as conclusive evidence of the unprofitability of the venture

In 1927 the question arose sharply The director of industries pointed out that the Stationery department had changed its practice of the previous three years and accepted a tender for blue-black registration ink from a private firm In the case of blue black ink powder the same firm's offer had been accepted again breaking the precedent of the previous three years In registration grade ink for cheques another private firm's tender had been accepted for two years running, whereas earlier the ink factory had supplied the stationery department

After mediation by the secretariat it was agreed that while the orders already placed could not be cancelled supplies of two ink powders should be provided by the ink factory However later in the year the secretariat had again to intervene as agreement could not be reached on the rate at which these supplies were to be delivered [17]

As the director of industries had claimed that the tenders that has underbid his own could not have been priced at the true cost of production, it is of some interest to examine the background material provided by the department to substantiate their charge This was based on the sudden rise and decline of successful tenderers, which the department claimed was due to price cutting to a level where the viability of the unit was subsequently affected

Clearly, the evidence cannot be used to demonstrate the practice of dumping, but what is of interest, is the erosion in the competitiveness of the tenders placed by the ink factory after 1926-27 What makes the problem more complex is the fact that the chief competitors appear to be four Indian ink manufacturers, Alayam Ink Factory in Coimbatore, Bengal Industrial Company of Calcutta, the Excelsior Oil and Technical Works of Poona, and the Premier Ink Works of Madras Only one of the tenders which outbid the ink factory, by the Students and General Stores, Madras in 1928-29 would appear to be that of a wholesaler rather than a manufacturer But even here, there is no information that this organisation sold British ink rather than ink made by petty Indian manufacturers In other words if the purpose of the ink factory was to demonstrate the technology of high quality ink production by the mid 1920s this job seemed no longer necessary [Government of India 1950] [18]

Detailed consideration of the prospects for the commercial success of the ink factory is necessary because the failure to continue to meet the requirements of the superintendent of stationery had serious consequences not only for the factory itself but for proposals by the department of industries for the initiation of other experiments The assertive phase of the legislative council continued up to the start of civil disobedience, and till then no decisive steps were taken But there were problems in selling the assets of the ink factory, and this led to still further doubts about such experiments Although the ink factory was continued on another yearly extension up to March 1929 the proposal to continue the superintendent (after 10 years of uncertain existence) was postponed to the following year a step which in retrospect sealed his fate and that of the Institute In the legislative council too there was impatience at the apparent listlessness in the Institute, and demands for information of new experiments to be undertaken

In the course of 1928-29 three matters came to a head If the superintendent of stationery was able to get ink of acceptable quality at rates cheaper than those supplied by the ink factory clearly there was a failure to demonstrate the commercial viability of the process it was argued Negotiations for the sale began though as the ink works were to continue as the basis for experiments in printers ink and other chemical experiments there was little to sell except stocks work in progress and the recipes developed by the superintendent The only potential buyer of the stocks was the superintendent of stationery who refused to accept them at the valuation by the department of industries Although the total capital invested in the ink factory was Rs 33,188 at the end of 1927-28 the stocks were valued at Rs 2,776 Thus when Rs 3,000 for the stocks and recipes were offered, they were accepted This was not as mentioned a glorious end to the ink production endeavour, nor to the government's attempt to expand the base of chemical industries [20] As an earlier director of industries was quoted as saying, the history of the fluid ink factory experiments themselves displayed the problems of marketing an easily manufactured product, in competition with small producers with low overheads [21]

III
Printers' Ink Experiments

The manufacture of printers' ink involved processes entirely distinct to that of ordinary writing fluids In many ways it was a much more testing exercise, one worthy of the efforts of a Government Industrial Institute. Essentially, printers' ink consisted of carbon black then imported from the US, which was incorporated in a varnish made from boiling linseed oil The vapour was ignited until the required consistency was achieved. The test to check whether the vapour ignited was dangerous and it was this that qualified the entire process to be considered a complex one

In the course of the year (1925-26) machinery for the manufacture of printers' ink was ordered from England Although the superintendent of the government press was not happy with the samples provided to him, private presses in the city were On a small scale the experiments could be said to be successful and more machinery and the use of an old government factory building was requested as the work proceeded into its fourth year (1928-29) [22]

It was the vexed question of the conveyance allowance that focused attention on the Institute's rather slow progress The question raised was of the necessity of the conveyance allowance originally granted in order to help the superintendent to commute between the fluid ink and printers ink factories With the sale of the fluid ink factory there seemed to be little justification for its continuance The claim which was advanced for its necessity although quite plausible in itself, seemed to carry little conviction in the politically tense period leading up to civil disobedience

The claim was that the work required constant travel and interaction with small printing presses the larger ones were busy and it was felt unwise to prejudice them with experimental samples In the small presses, the machines had to be cleaned before and after the experiments which meant extra trouble for the workmen This in turn, required frequent and often infructuous visits to small presses in outlying areas of the city In addition, different printers varied in their opinion of the results depending on the machines and on the paper used [23]

This was a good case of the problem of introduction of a new product on the market by an enterprise which was unable unlike a private entrepreneur to provide any long-term benefit to the buyer This disadvantage had then to be overcome by repeated visits, entreaties and probably the promise of benefits to accrue once the superintendent

of the ink factory was placed permanantly in a highly coveted government job However there was little sympathy for all this in the secretariat and the image of both the superintendent and of the experiments began rapidly to lose credibility

It is difficult to avoid the feeling that the department of industries displayed a paralysis of will during this period It put forward proposals without sufficient background work and when these were opposed appeared to accept the outcome with little more than an expression of disgruntled feelings It seemed to have been misled by the strong political support which began in 1927 into believing that it had only to advance a scheme for it to be accepted even when the political situation had clearly changed by the end of the decade and its own ineffective supervision of the ink factory related experiments had substantially reduced its credibility [4]

However constraints of a structural form need also to be kept in mind Some indication of these came in a report that the publication *Tamil Nadu* was prepared to place an order for printers ink but found that the machinery dealer who also dealt in paper ink roller composition and so on refused to guarantee spare parts unless all supplies were bought from him Here was an example of interlocking markets about which a government institution could do little Another factor lay in the structure of tariffs customs duty on lamp black was 15 per cent as opposed to 2½ per cent on printers ink Thirdly it was stated that the consistency of the varnish made from linseed oil by boiling was altered by adding amongst other things a mineral oil not made available locally through either Burmah Shell or the Vacuum Oil Company

All these factors led to a high cost of production which could be partially overcome if lamp black itself was made in the country So somewhat belatedly after five years of experiment lamp black manufacture was instituted This was obtained by the incomplete combustion of organic substances rich in carbon such as rosin turpentine and the roots and other resinous parts of trees Significantly for Madras fish and vegetable oils either fresh or rancid could also be used to make lamp black In actual fact ingenious experiments were initiated on its manufacture from dead and crude oil using a specially devised furnace and collecting apparatus The yield was about 20 per cent of the oil burnt and the results seemed to be good enough both for rotary and higher quality printing ink Coal too was also suggested as a suitable material to be tested However these experiments were made by a research engineer specially recruited whose performance was monitored at three month intervals The Government Industrial Institute itself and Venkataraman Iyer its superintendent for 10 years and government employee for over 13 years had both to go on the recommendations of the Second retrenchment committee in the early 1930s In July 1932 the Institute was to close and the printers ink enterprise to be handed over to private hands

The financial stringency which led to the closure of the Institute also led to the discontinuance of perhaps the most industrially important of the initiatives the manufacture of white lead used both in white and coloured paints

In 1926, a proposal to manufacture paint had been dropped because linseed oil was said to be unavailable in the presidency Although it was recognised that barytes and ochres were important raw materials in addition to linseed oil the possibility of using the Kurnool barytes deposits was not investigated until five years later In 1931 the director of industries discovered after a visit to Bangalore that Kurnool barytes were being used by the Bangalore Whitelead Syndicate in a process developed by the Indian Institute of Science during the war Barytes were largely sent to Calcutta where the English firm Shalimar Paint Company had a plant It was because this company kept the process a commercial secret that the Institute of Science had to rediscover it In this case strenuous argument led to the successful initiation of experiments which were to be discontinued within the same year on the grounds of financial stringency A proposal to transfer both Venkataraman and the white lead experiments to the Kerala Soap Institute did not succeed It was argued that the Indian Institute of Science should be increasingly used for such work [5]

IV
Conclusions

In its 1918 Report the IIC had legitimised the role of the government in pioneering industry through the demonstration of the technological and then commercial feasibility of a prototype factory However it had not sufficiently noted the then current evolution of the specific discipline of chemical engineering and the impact that this was to have on industrial design and on the production of more cost effective plants Nor was it able to offer a solution to the evergreen problem of inducing large institutional buyers to accept an indigenous article with all the attendant risks when they had a long tradition of buying imported substitutes with well established trade names The history of the government Industrial Institute described in this paper demonstrates the critical absence of a systematic approach to both these problems

Concept

EDUCATION AND VALUES IN THE MAHABHARATA

N.L. Gupta

Hardbound Rs 300

The present book utilises for the first time the vast material on various aspects of education and value-system available in the Mahabharata The author has made deep study of the subject in all its aspects and dealt with various topics such as the aims of education, educational institutions the teachers and students the subjects of education, methods of teaching, examinations etc He has quoted profusely from the Mahabharata and other works in Sanskrit in support of his observations He has given an exhaustive account of branches of learning then prevailing and the masters of learning as visualised in the Great Epic It is a comprehensive and erudite work on the subject

Dr. N. L. Gupta is presently working as Assistant Commissioner, Kendriya Vidyalaya Sangathan (Delhi Region) JNU Campus, New Delhi

Publishers Ph 5554042, 5504042

It also shows that import duties, by modifying the price ratios between the raw materials necessary for the manufacture of an article, and its imported substitutes, can affect the economic viability of plant which may be intrinsically efficient. Finally, it shows that venture capital is a form of financial advance quite distinct to a loan, and that while individuals like Nicholson were for short periods able to operate with an advance in a decidedly venturesome way, eventually the government of Madras' financial conservatism prevented the consolidation of the Institute's contribution to technological knowledge. For all these reasons, the Government Industrial Institute in Madras born in 1919 led a Soloman Grundy like existence until its death in 1932.

Notes

[Revised version of a paper presented at the conference of the Cambridge Delhi Leiden Yogyakarta project on the Transfer of Science and Technology between Europe and Asia, Istanbul, October 1994. I am grateful to Ashok Parthasarathi and Ghayur Alam and Ravinder Kumar for their comments and to the Indian Council of Historical Research for a travel grant which made my participation in the conference possible.]

1. The report of the Department of Industries for 1919-1920 in Rev (Spec) 4 January 3, 1921 contains the major landmarks in the fortunes of the department from the initial proposal in 1905, the expression of European opposition to it in 1908, its closure in 1910 and a legislative council resolution opposing this step in the same year, reconsideration of the question in 1912, and its re-establishment in 1914. For the history of the department's activities in the earlier period see Sen (1972), Swaminathan (1988).
2. Frederick Nicholson played a critical role not only in various industrial experiments in Madras but also in the development of the agricultural co-operative credit system. For details see Bruce L. Robert (1979). There is an interesting vignette of his role in the Madras of the 1920s in Slater (1936).
3. Revenue G.O. No 892 (Press) of March 21, 1914 for the orders to restart the department of industries, Revenue G.O. No 2802 (Press) of September 26, 1914 and No 3468 (Press) of November 30, 1914 for details of some industries in the presidency. Revenue (Special) G.O. No 374 (Ms) of September 13, 1918 for the steps taken to start industries for the war effort. 13. It had, for instance, to be pointed out to the director of industries by the commercial audit that if the superintendent of the ink factory was involved both in commercial ink production and in experimental work, his salary should not be entirely debited to the commercial accounts of the ink factory. As a rule of thumb thereafter, half of the salary was set against the experiments and the other half for ink production. As this appeared to have been done entirely at the Director's office without an investigation of the actual situation, this may well have continued to raise artificially the costs of production of ink due to superintendence charges. Dev 1827 November 9, 1927.

   However, mention may be made here of an attempt (unfortunately rather rare) to handle one question that of high overheads inevitable in a government concern, in an imaginative manner. This arose in connection with the problem of the preparation of raw material for ink production and the cleansing of used jars for storing newly manufactured ink. If sequentially undertaken, these tasks would have taken up a substantial amount of the working time of the few lascars appointed for the purpose. This time could be saved if these tasks were undertaken at night outside official working hours. However, in the absence of substantial overtime payment, the lascars would for good reason have been unwilling to work at night and overtime payment was not an item that government easily accepted. A way out was found by appointing the lascars as night watchmen by which means payment for their work at night was sanctioned. Unfortunately, this was not the major issue affecting the prospects of the industrial institute. Dev 412 March 20, 1925.

Postcolonial in the Postmodern

Or, The Political after Modernity

Vivek Dhareshwar

A crucial issue for any cultural or political theory today is, what are the consequences of the challenge to the modernist interpretation of modernity presented by theory and by globalisation, and what happens to notions such as national identity sovereignty and citizen-subject. In this paper the author examines these issues by looking at three different scenarios of postcolonial political identity illustrated by writings of modernist writer U R Ananthamurthy, cultural theorist Geeta Kapur and philosopher Kwame Anthony Appiah.

Our Modernity[1]

WE have been mediating modernity. Whether we take our political practices or our work upon ourselves our bodies or the ties that have bound us together into some form of community – if in short we take the identity programmes that have been shaping us – we have been striving toward modernity. But a certain problematisation of modernity, both as a notion and as a lived experience, has been part of this commitment. The reason for this is well captured by the Martinican writer Edouard Glissant:

> *On the notion of modernity.* It is vexed. Question: Is not every era modern in relation to the preceding one? It seems that at least one of the components of our modernity is the spread of the awareness we have of it. The awareness of awareness (the double, the second degree) is our source of strength and our torment.

As the institutional and discursive horizon that governed our function of mediating modernity is disintegrating before our eyes, causing our torment to deepen, we must turn to what Glissant calls our source of strength: our reflective awareness of our practice of modernity, our ability, in other words, to problematise that practice – to work our way out of the aporias of our modernity. The problematic that Kwame Anthony Appiah calls the articulation of the postcolonial and the postmodern[2] focuses our attention precisely on the issue of defining a reflective relation to our time, to its historicity.

I would like to make an attempt here to draw out the theoretical consequences of particular ways of staging that articulation. My strategy involves looking at three scenarios, which we might like to think of as scenarios of postcolonial political identities. I have chosen a short story – 'A Horse for the Sun' – by the modernist writer U R Ananthamurthy,[3] some essays by the cultural theorist Geeta Kapur,[4] and an essay 'Is the Post in Postmodern the Post in Postcolonial?' – by the philosopher Kwame Anthony Appiah. The setting up of these three scenarios will enable me to outline what I take to be the crucial issues that any cultural or political theory must confront today. What are the consequences of the challenge to the *modernist interpretation of modernity* by theory on the one hand and globalisation on the other hand? What happens to notions such as national identity, sovereignty, citizen-subject, tradition – notions supported by the modernist understanding of modernity?

Modernity and Its Doubles

Ananthamurthy's 'A Horse for the Sun' stages the encounter between discrepant experiences of modernity and the dilemma of the 'modern' writer mediating that experience. I will analyse how that encounter is framed and how that framing leads to a doubling/splitting.

Written in the mid-1980s, the story can be read as an interrogation of modernity itself – not only the aesthetic modernity of the writer but also its implication in or complicity with the project of modernity in its political and economic sense. The story – an explicitly autobiographical one – goes something like this. The writer Ananthamurthy, a leading modernist writer with considerable involvement in some form of left politics, is visiting his village. One day at the market place he encounters his boyhood chum Venkata whom he has not met in the last 14 years. Although Venkata is older than the author by five or six years, they had been in the same class at school thanks to Venkata's repeated failures. The author had subsequently left the village, gone abroad and returned to teach in the university and had become a city-monkey. And Venkata, who was already something of a 'good for-nothing' 'character', had blossomed into an 'idiot'-like figure, irresponsible as far as his family was concerned, but generous in his help to the villagers, giving massages and oil-baths to anyone he could get hold of. This sudden encounter makes the author nostalgic for the many adventures he had shared with Venkata, and for the way Venkata 'had time and again freed up [his] mind" (HS, p. 100). So the author decides to visit Venkata's house and spend the day there. Delighted, Venkata offers to give him his celebrated oil-bath (which as it turns out is an elaborate ritual embodying Venkata's 'philosophy').

This 'accidental' meeting opens up' our modernist writer and initiates his self-interrogation. Although the self-interrogation is occasioned by this accident, it is clear that the space for it was in some sense prepared for.

> Wait, I said. I had to talk to him honestly and say I had ignored you. Although I came to the village every now and then, I never came to see you. You met me accidentally today and are opening me up like this. Yet I know that this game is only momentary. I am drying up. This clowning of yours may be a habit with you. But in me there's been born a disquiet that I cannot understand. I desire nothing. Of late I can't think of anything to write. The moment I open my mouth, big fat words tumble out – the heads in front of me nod in appreciation. The moment the play is over, I feel empty. Why don't I see anything? Do you see, or are you merely pretending that you see? Isn't even your humility a posture? Or is it that I who had spent my childhood with you didn't write about you, but instead went on to write about high falutin things and ended up being an empty drum like this? (HS, pp. 104-05)

The crisis in which the author finds himself is something more than the crisis of creativity, which is one of the self-defining cliches of the modernist self. The crisis seems to have called into question the very vocation of the modernist practice. The interrogation, however, has already initiated a doubling and splitting of the subject. Starting out as a cause of nostalgia (for the writer's own childhood), Venkata (the writer's past as well as his unrealised future) doubles as an agency of self-critique. The rest of the journey toward Venkata's house unfolds as an oscillation between a critique of Venkata's form of life and ironisation of that critique and its language.

The author's own ambivalence toward Venkata makes him alternate between an attitude of aggression and one of empathy – aggression toward the "inertia" that he sees

Venkata as embodying and empathy for his intimacy with the landscape

> I began to think the village idiocy that Marx spoke of, which is the cause of this country remaining backward and so on Venkata seemed to symbolise for me everything that lived in a state of inertia I tried as seriously as possible to expound to Venkata my anxieties about the stagnation in this country that I had been sharing of late with my friends But is he the kind who would listen? (HS p 106)

Venkata at first evades this assault, but in his own clowning fashion expounds his philosophy He clearly diagnoses the author as someone possessed whose head is all heated up the cure for which of course, is his oil bath He confesses disarmingly to being a coward and narrates an incident that illustrates both his cowardice and his strategy for coping with aggressions such as the one the author directs at him

> You know we were in Panjurli's grove before we crossed the bridge An idiot They say this Panjurli spirit has his temper at the tip of his nose Once long ago I was coming through the grove singing to myself It was evening The dry rustling sound behind me like someone stepping on dry grass I turned around to see what it was It was a tiger I blacked out and collapsed I came round and found that I had peed in my shirt (HS pp 107-08)

. Irritated and baffled by this anecdote the author wants to know the point of it

> Che Che just like that I am a sissy Ananthu I didn't know what to say to you when you started to talk as if that demon Panjurli had possessed you I was frightened by the tiger do you know why? Because I don't know how to catch it and make it sit down and give it an oil bath If only I knew I'd hold it by its whiskers make it sit down and gently massage it forehead (HS p 108)

Confronted by the aggression of modernity or its mediators like the author Venkata's response is either to cool it down or evade it altogether Frightened by the seductiveness of Venkata's response and provoked by the laughter that followed the author renews his assault

> "Hey you fool Can you live without an ego? Even a saint needs an ego Saying this I thought without destroying the likes of Venkata there is no electricity, no dams no penicillin, no dignity no respect, no joy of sex no woman won no peaks, no aircraft no evolution no memory no passion, no joy (HS, p 108)

But Venkata laughs off this too and what's more, further refines his philosophy to characterise the aggressivity of the author's subjectivity

> The supreme Soul is Father to some, Mother to some Those who think of it as Mother always have their eyes on Mother's breast It is a breast ever flowing with milk Those who drink it can't take their mouth off that breast They don't ask for other breasts Those who think of it as Father raise their heads and look at the Lord in his eye and they are roused They want to look and they want to swallow the whole world Can the hunger of the eye ever be quenched? The infant at the breast falls asleep it wakes up again and drinks the milk I am one of those who drinks You are one of those who sees (HS, pp 110-11)

It begins to look as though the other as the agency of self critique is exceeding its terms And the already ironised language of that critique ("I shouldn't give in to him just because my raised fist has withered [HS p 110]) finds it difficult to contain the double The problem is not simply that the author 'need[s] English words to do that Or translations of them that Venkata doesn't understand' (HS p 112) He clearly understands the consequences of that language and tries to evade or refuse them

This is not to say however that Venkata's philosophy can cope with the consequences of modernity as is evident from what is happening to his college going son This son has turned out to be something of a lout he had beaten up his college principal and threatens to beat up his own father and his mother discovers during the author's visit that he had also stolen whatever jewellery the mother had preserved for her daughter's wedding A victim of modernity then with whose predicament – being trapped in the narrowness of village life – the author at first sympathises seeing in the son his own struggles to escape from the village However an incident that occurs when the author is sleeping in Venkata's house disturbs him deeply At the crack of dawn the author waking up to some noise finds the son ravaging the beautiful garden cultivated by Venkata's wife and daughters and threatening to chop up whoever goes near him Then he begins to see in the raised hand of Subba the son the nihilism of modernity (that had indeed created nuclear weapons and poison gas), thus more or less subscribing to Venkata's theory of aggressive subjectivity Yet this nihilism of Subba seems to reveal the limit of Venkata's philosophy The author, who had tried to contain and subdue this double, feels deeply for Venkata and wonders if this incident has shattered him A few hours later, when the household is engaged in its early morning activities, he finds Venkata standing by the fence and gazing at something in complete absorption Going near Venkata he finds him looking at a 'suryana kudure' (a sun's horse or grasshopper)

> Venkata turned around and looking at me said with such innocent ecstasy 'The sun's horse' My eyes locked into those wonder struck eyes of his that had seen the sun's horse and my mouth fell open "The sun's horse" I said (HS, p 126)

Two interpretations are possible of what this story stages One is that Ananthamurthy frames the encounter of the discrepant experiences of modernity within a *modernist* understanding of modernity, which sees the content of the latter as simply the *loss* of tradition, writing itself then becoming a 'fall' into irony Passages like the following would support such a reading

> If he reads what I write he will only read himself Since he is a simpleton to begin with even my irony won't touch him But what began as an object is now confronting me as consciousness For one without desire, the incessant movement of the world its flux its change are of no interest In the presence of such a non political being all my knowledge is a waste This man is the exact opposite of a Kissinger But in Gandhi along with an inspiration there was a quietude too Aric Venkata you came in as a story now you are growing into an essay' (HS p 127)

The feigned surprise at confronting the figure of the other at staging the other as a critique of one's own modernist self (But my mind wouldn't let me brush aside this childhood friend of mine who had begun to kindle in me the human love that I seemed to have lost of late [HS p 124]) can be read as an attempt to recuperate the figure of Venkata as a redemptive double of the politics that underlies this aesthetic The other is cause for nostalgia he and his habitus are also possible agency of a self-critique, but the divide is nonetheless absolute Even the value of that critique is an aesthetic one to celebrate this peculiar subaltern oneness with nature but also and perhaps more importantly a display of the author's aesthetic virtuosity in staging a self-critique

Another interpretation the one I favour here would inflect the above interpretation to foreground the political impasse The story is indeed an ironic self critique of modernity The other - who cannot strictly be seen as an other of modernity but is more like a doubling or splitting produced by modernity itself tries to evade mediating modernity even steps aside when confronted with it accepts it even but does not resist modernity The self questioning ironic modern(ist) self tries to confront it, then delights in it, and finally tries to learn from it The exhaustion of modernism (and of modernity) has made the writer already question his role as a mediator of modernity – the attempt to confront Venkata to show him his failures, has none of the force that an energetic modernity (including and especially Marxism) had brought to its critique of society That critique and the politics made possible by it is already perceived as violent although the terms of that critique are seen perhaps as the only

available political and aesthetic vocabulary – now used with increasing irony and scepticism The impasse or aporia is evident in the absolute divide the doubling between the author and Venkata they are of course figures generated by modernism and modernity The story does not (cannot) resolve the aporia the divide or doubling Although it is plausible to interpret (as I did above) the story as an aesthetic redemption where the ironic subject of modernism stages the other as the 'idiot subject' in order to recuperate it as its redemptive double it is equally plausible (and fruitful given my purposes) to interpret it as staging the aporia of political modernity in India The aesthetic delight that the author shares with Venkata in looking at the sun's horse cannot conceal the fact that their relationship has no chance of being embodied politically Our time our discrepant modernity is experienced then as an aporia It remains to be seen if it can be overcome dialectically

The Modernism and Swadeshi Avant Garde

Let's make an attempt to locate the space and subjectivity of Venkata within a Marxist theory of modernity We remarked earlier that the figure of Venkata cannot strictly be seen as an other of modernity One reason for this is of course that he is within the social relationships instituted by modernity by capitalism Although he and his household appear marginal to the market he cannot escape from it (he sells banana leaf cups made by his wife) He appears that is at that stage of the capitalist relations that Marx characterises as formal subsumption of labour by capital and he and his habitus are bound to disappear when real subsumption occurs As Etienne Balibar explains it

> the idea of this real subsumption (which Marx opposes to merely formal subsumption) goes a long way beyond the integration of the workers into the world of contract of money incomes of law and official politics it implies a transformation of human individuality which extends from the education of the labour force to the constitution of a dominant ideology capable of being adopted by the dominated themselves

For this to occur the inertia of Venkata would have to be overcome and that is how Ananthamurthy diagnoses the stagnation of our country Is the figure of Venkata then the leftover of an incomplete modernity who will vanish when the real subsumption begins who will then reappear as the redempted double in the aesthetic modernity of a fully modernised nation? We also noticed a lack of conviction that seemed to introduce tensions or ambivalences in modernist aesthetics as well as in modernising politics To fully account for those tensions and ambivalences we need to understand the exigencies of a modernising capitalism and the modernising imperatives of a left politics and how both these get interarticulated by the nation-as subject To explore these tensions we will turn to the work of Geeta Kapur who in a couple of programmatic pieces as well as in a series of analyses of art-practices in India is setting out the project of an Indian avant garde

Geeta Kapur sets out her argument and frames her problematic within what seems at first blush to be the terms of a classic left agenda Her argument in fact starts from the premise that modernism has not yet exhausted its possibilities in India And the reason for it is obviously not unrelated to the fact that the modernising project as envisaged by the left has not exhausted its possibilities The project of left modernism then has to be embodied in an artistic avant-garde whose function would correspond to and no doubt complement that of the vanguard Leninist party Posited as a horizon, it will never be questioned for itself although its function will become obvious when Kapur makes an attempt to delineate the tradition which makes possible the left modernist project, its political value will remain undetermined

How to name the contemporary (MIP p 2805)? That is the form that Geeta Kapur's attempt to specify the modern takes She prefers the use of this neutral term in order to refocus the problems generated by the embattled (and also absolutised and reified) terms like tradition and modernity (CP pp 49 53 54) The task is to say how to experience our own time and it involves defining (or recovering) the founding equation between history and subject and thus constituting the revolutionary or avant garde subject in the historical context of a decolonising post-colonial India (MIP p 2805) To name the contemporary to figure out the category or register in which this naming takes place one needs an account of the multiple and conflicting registers in which a people (in this case Indian) have been named Thus a theory of tradition and of tradition in use

To begin with though, for whom is this question of the contemporary important?

> Once independence has been gained nationalism itself poses ontological questions what is at stake in being Indian? And though the question may easily devolve into rhetoric there is a burden of it that rests on a particularly fraught class and its individuals This is the urban middle class intelligentsia including the artists (CP p 55)

This descriptive statement embodies a normative argument as becomes obvious when she argues later on in the same article that

> Moreover when nationalist truth and unrealised socialism no longer suffice this class must cope with the further states of social entropy The responsibility of reckoning with that falls neither on the state nor on the national bourgeoisie (nor on the peasant or proletarian classes) because none of these are so evolved in their identity or role (CP p 55)

So the burden of identity of naming the contemporary, is assumed by the new citizen subject The site occupied by this subject is where the chiasmus between nation/tradition and modernity takes place, for the sovereignty of the citizen is exercised in the name of a people who have to be named again and again Geeta Kapur's own theory of the interplay between the national and the modern occupies that site even as her reworking of the tradition prepares the political and aesthetic ground for the arrival of an avant-garde That is to say her interpretation of the tradition imagined by the nationalist intelligentsia offers a normative framework within which contemporary art practices may be situated

> Instead of internationalism there is in India the double discourse of nationalism and modernism It is a generative discourse and when projected outward it becomes a four part equation nationalism recalls the category of the tradition modernism always implies internationalism The four part equation further enables one to confront the question of tradition (or invented tradition that ensues during nationalism) with current internationalism (or globalism) and its appropriative techniques (MIP p 2804)

The double discourse of nationalism and modernism indeed the doubling of the one into the other has been the founding problematic of defining the national (or citizen) subject, the self-inauguration of the subject as subject of history But the history of this subject, that is to say, the history of the subject to see himself (the masculine pronoun is appropriate here) as the subject of history has been naive bold, and anomalous' Because, of course, the naming of the subject took place in response to colonial modernity The native as the historically displaced subject had to articulate itself into history, that is into European modernity both aesthetic and political The norming narrative (or metanarrative) of European modernity and its ever-receding synchronic symbols provide the structure within which the self-definition of the colonial subject takes place This defines the continuity of colonial and post-colonial modernity the interchange or the chiasmus between modernism and nationalism subtends, even now, the self-fashioning of the citizen-subject According to Geeta Kapur the practices of the artists at test to the anomaly of the Indian modern

> First of all there is a dissembling modernism at the heart of the argument about authenticity This characterisation is

> artists revert time and again to naive solutions to formal problems that have their source in modernism even unrecognised by the artists in question (MIP p 2804)

So the apparent weakness of Indian modernism is its strength Though it takes its bearing from the norms of international modernism, its struggles for self-definition reinscribe and revise that internationalism Forever denied a place in the canon of the modern because always out of step" with the norms of the European modern, the modern in India has 'a paradoxical value' rather than a canonical position'

> To cut down the issues to reasonable size, nationalism in our experience is at the very least a foil to the universal modern It helps resist imperialist hegemony up to a point it serves as environmental testing ground for unbecoming modernism Just as modernism as cultural and specifically aesthetic category interrogates through its formalist means through its negative dialectic and valorised transgressions the dangerously totalising ideology of nationalism (MIP p 2805)

Given the logic of this chiasmus it turns out that internationalism has never been the paradigm for cultural discourse in India although progressive aspects of international modernism (especially its avant garde principles as formulated in for example Brecht and Eisenstein) have been influential And for Geeta Kapur this needs reiterating especially in the present when a cannibalising post modernism threatens to destabilise the founding equation between history and subjectivity and to dissolve the nation-space into multiple local traditions in order to co opt them into the circuits of a global market

Where we may well wonder at this point is the project of left modernism in all this? If the unresolved subjectivity of the national subject still forms the horizon of a possible avant garde praxis isn't the enunciative space of this avant-garde already re-occupied by the nationalist project? And, furthermore, in the face of the 'aggressive *laissez faire* of postmodernism" the avant-garde seems to have no room left to question that re occupation without feeding into the logic of postmodernism In an ironic reduplication of the passive revolution of the Indian bourgeoisie, the Indian left avant-garde seems condemned to complete the nationalist project and in the process lose its own enunciative space, caught as it is in the never-ending doubling of the nation into the modern, and vice versa [10] The interchange between the nation and modern has become a double-bind which Geeta Kapur's framing of the problematic seems only to replicate

> The point is to tackle the very problems western cultural hegemony suppresses or neglects This requires above all that the two concepts, tradition and modernity, be disengaged from the abstractive ideology of capitalism – retaining to one a self-reflexive mechanism, and to the other the utopian dimension We have to bring to the term for example the concreteness of extant practice and to make genuine extension of small particularities into new and contemporary configurations Also at the same time we bring to the term [modern?] a less monolithic less formalistic indeed a less institutional status so as to at least make it what it was once a vanguard notion leading to a variety of experimental moves Only with such initiatives can third world cultures begin to justify their worth as alternative cultures (CP p 56)

Alternatives to what? Globalised post modernism? Turning traditions into tradition in use has been the task that artists have set themselves since the last *fin de siecle* This was done partly through the appropriation of the folk the regional etc Such appropriations were justified insofar as they gave content to the self-definition of the national subject and its goal of uniting disjointed histories and trajectories into a coherent and complex whole But this still seems to be the task even today As for the task of transforming modernism into an avant garde project it is forced to hold together the nation in the face of globalisation The left avant garde then supplements nationalism The social antagonisms that modernisation brings about and which nationalism tries to suppress cannot be addressed or they have to be deferred

The problem arises not only because of the present political conjuncture, the very subject that the left tries to articulate into history is articulated by the suppression of antagonisms Indeed this subject is the symptom of that suppression, and the articulation of antagonisms would mean risking the disintegration of this subject Although Geeta Kapur notes the antagonisms a Marxist is obliged to notice, she does so only in an extraneous fashion, as it were That is to say, her own organising concepts do not register them internally

She would certainly see Ananthamurthy as an 'anomalous modern' – modern insofar as his dominant trope in the story we analysed is irony anomalous because the story moves away from the formalism of the high modern in order to foreground local or indigenous practices Thus the story can be seen to execute a double-take", precisely what according to Geeta Kapur defines the Indian modern (MIP p 2805) The political aporia the story foregrounds would have to be excluded in order to reconstitute the citizen-subject In the process of making the tradition self-reflexive of making it tradition-in-use, what takes place is precisely what Edouard Glissant calls 'folklorisation" of culture (for the purposes of this argument we can take Venkata to be a folk artist, which he could very well have been) The aesthetic double-take then necessarily excludes from its consideration the political problem of doubling. The constitution of the unitary subject seems to be the unfinished task of the Indian modern The task of articulating this subject into history and figuring him as the contemporary falls upon left modernism Even as it appropriates the folk, the regional, the local for this task, it stakes claim to the power of the collective, to *re present* the latter [11]

Globalisation, and with it postmodernism, however threatens once again the task of articulating the self into history While postmodernism releases possibilities contained in alternative practices and cultures it does so only to turn them into pastiche it destroys a monolithic high modernism only to turn all cultural artefacts into commodities it proposes forms of politicising culture (race/gender/ethnicity) as so many loci of resistance only to turn them into multiculture so many constituencies to be mediatised' in short, by deconstructing modernism it also deconstructs the subject of modernism So that the unfinished task of modernity becomes the unending task now of combating cultural and political forms of globalisation Strangely enough, while Geeta Kapur notes how postmodernism may have released or made visible alternative practices she does not extend this insight to the very constitution of the citizen subject - that indeed this constitution itself was a form of identity politics that an embattled modernism now perceives as a danger coming from postmodern multiculturalism (relativism, celebration of difference etc) If the project of the left avant garde is forever deferred or it fails to appear on the site prepared for it it is undoubtedly because, as I have suggested, that position is occupied by a subject which is the creation of the exchange between modernism and nationalism And what the present conjuncture makes clear is that this subject is the very suppression of antagonism, and that is why when threatened with dissolution, this subject can only defend that which enables it to maintain its identity, namely the nation-state and its politics The story of modernity that Geeta Kapur narrates is compelling and, in some sense of the word, true, because it outlines the cultural elaborations of the citizen-subject and the logic of identification that maintains the site it occupies as the only legitimate horizon for understanding our time [12] As such it cannot allow discrepancies and dislocations to arise at that site And the teleological historicism that this story requires in order to institute culture as the problematic of identity, of identification, must exclude any questioning of the very instituting of the political, the social imaginary in which the form of society appears to itself, because that would reveal the radical contingency of instituted forms of politics, the dissimulation which is sought

to be accomplished by the chiasmus of modernism and nationalism It is indeed ironical, but not accidental, that a left modernism should play either the role of supplementing them or compensating for their excess, and either way, end up supporting the sovereignty of the nation-state The transaction between left modernism and nationalism leads in fact to a re-occupation of the former by the latter [13]

The 'Post' in Postcolonial

The problematic that Kwame Anthony Appiah calls the articulation of the post-colonial and the postmodern (PP, p 341) focuses our attention on the disintegration of modernity as a social imaginary and the consequent multiplication of perspectives on, and evaluations of modernity Appiah's elegant if rather convoluted and elusive, essay proposes that we reject the modernist interpretation of modernity Taking the Weberian interpretation of modernity as somehow paradigmatic what this rejection involves is a denial of the triumph of western rationality – whether evaluated negatively or positively - as the telos of all cultures That is to say, western modernity has certainly achieved universal significance but that it has "universal value is extremely doubtful What this interpretation of modernity mistakes for rationalisation – positing such distinctions as tradition and modernity – is simply the commoditication of all areas of life Therefore Appiah wants to

> argue that to understand our our human modernity [we will return to interrogate this later on] we must first understand why the rationalisation of the world can no longer be seen as the tendency either of the west or of history why simply put the modernist characterisation of modernity must be challenged (PP, pp 343 44) [14]

The rejection of modernist interpretation, however manifests itself in various spheres is the rejection of the claim to the exclusive insights claimed or implied by modernism

> Postmodernism can be seen then as a retheorisation of the proliferation of distinctions that reflects the underlying dynamic of cultural modernity, *the need to clear oneself a space* Modernism saw the economisation of the world as the triumph of reason, postmodernism rejects that claim, allowing in the realm of theory the same proliferation of distinctions that modernity had begun (PP, p 346, emphasis added)

The 'post' in post modernism, then, is a space-clearing gesture, a distinction creating gesture linked to the exigencies of the market The exigencies of the market apply globally bringing into their orbit practices that it would be misleading to characterise as 'traditional'

And that is how "the issue looks from here", that is, the US, where Anthony Appiah, a postcolonial intellectual from Ghana, has come upon a "neotraditional" sculpture called 'Man with a Bicycle' by an anonymous artist from Nigeria, which prompts Appiah to "explore the articulation of the postcolonial and the postmodern" How do things look from "there", that is "from the postcolonial spaces inhabited by 'Man with a Bicycle' (PP, p 347)? Now Appiah rightly says that some of what he says about how things are "there' would hold for other postcolonial spaces and some would not My interest is certainly not to quarrel with that since I think that the problematic formulated by Appiah is valuable in our space too To begin with, Appiah argues that

> postcoloniality is the condition of what we might ungenerously call a comprador intelligentsia a relatively small western style western trained group of writers and thinkers who mediate the trade in cultural commodities of world capitalism at the periphery In the west they are known through the Africa they offer their compatriots know them through the west they present to Africa and through an Africa they have invented for the world for each other and for Africa (PP p 348)

This provocative characterisation is meant to highlight some essential, if obvious features of postcolonial culture First the post in postcolonial, like the post in post modern, signals a space-clearing gesture Second this concern with transcending with space clearing, is the business almost exclusively of the mediators of modernity, those whom Appiah calls 'comprador' For although colonialism (and now postmodern culture) pervades all aspects of postcolonial cultural life, not everyone is interested in or concerned with going-beyond The anonymous artist who produced 'Man with A Bicycle' is not or so Appiah supposes, concerned with issues of 'cultural imperialism', cultural autonomy, etc, he produces to survive and since his buyers are largely western tourists, he produces for them without worrying about the politics or aesthetics of his activity Certainly, this international cultural transaction – which accounts for its hybrid or syncretic character – can be understood by a postmodern theory, but the producer himself/herself does not understand it in the terms of that theory In short, the sculpture 'Man with a Bicycle' is not the result of a space-clearing gesture

The concern with going-beyond, argues Appiah, makes sense only in a domain where the distinction between 'high culture' and mass culture' operates, and this domain is obviously the one occupied by the western-educated intelligentsia Therefore postcoloniality as a problematic turns up, for example, in discussions of African novels The African novels of the first generation – Achebe's *Things Fall Apart*, *L'Enfant Noir* – produced narratives of the nation and realist legitimations of nationalism In contrast, the second generation novels – Appiah's privileged example being Ouologuem's *Bound to Violence* - deconstruct precisely those legitimising narratives, they are, in that sense post-realist, post-nationalist, post-nativist In this, their post- is like the post- in postmodernism There is, however, an important difference Appiah contextualises the difference in this way

> Far from being a celebration of the nation then the novels of the second postcolonial, stage are novels of delegitimation they reject not only the western *imperium* but also the nationalist project of the postcolonial national bourgeoisie And so it seems to me the basis for that project of delegitimation cannot be the postmodernist one rather it is grounded in an appeal to an ethical universal Indeed it is based, as intellectual responses to oppression in Africa are largely based, in an appeal to a certain simple respect for human suffering a fundamental revolt against the endless misery of the last thirty years (PP p 353)

Making his argument largely through a reading of *Bound to Violence*, Appiah is at pains to show the difference between the two posts The critique of the nation found in that novel is not postmodernism since the novel is concerned with postmodernisation, "not an esthetics but a politics" (PP, p 352), that is, with denying the claim of the modernisers that after colonialism 'comes rationality" And its rejection of the nation too may seem misleadingly postmodern, that rejection, however, is predicated not on a return to traditionalism, but on "the continent and its people" (PP p 353)

Let's begin by noting what on the face of it might appear to be terminological problems the first contrast above seems to make sense only if one restricts oneself to an aesthetic postmodernism Appiah's own characterisation, which we noted above, should allow for a postmodernism which links modernisation and modernism and which rejects them both The second contrast is even more unclear, it seems to imply that a postmodern rejection of the nation might involve some sort of nativism or, if we take into account the appeal to human suffering that the postcolonial novel makes, some sort of nihilism or relativism What these terminological or definitional problems point to is something that Appiah constantly elides namely, what politics is in post-modernity, and how that is addressed by postcolonialism and postmodernisms [15]

Despite the insights achieved by the postcolonial novelists, they do not seem to point toward any political forms, except a postnativist internationalism which, however, remains at the level of abstract

humanism. Perhaps because of this pessimism – "postcoloniality has become, I think, a condition of pessimism' (PP, p 353) – Appiah argues that "the place to look for hope is not just to the postcolonial novel, which has struggled to achieve the insights of Ouologuem and Mudimbe but to the all-consuming vision of this less-anxious creativity [of the anonymous artist]" (PP p 357) The question is why does Appiah think that the creativity of the anonymous artist is 'less anxious' Merely because it is not concerned with going-beyond with space-clearing' His worry seems to be that the logic of the space clearing gesture leads postcolonial intellectuals to the risk of becoming otherness machines with the manufacture of otherness as our principle role Our only distinction in the world of texts to which we are latecomers is that we can mediate it to our fellows (PP p 356) The mediators of modernity seem condemned now to mediating postmodernity – which is to say avoiding any mediation with our fellows For mediating modernity involves politics however problematic it may appear now however questionable its achievements have turned out now Having deconstructed the nation state and having declared their allegiance to humanism all they can do is to adapt the responses made famous by Albert O Hirschman voice and exit leaving the nation to the less anxious creativity of the subaltern artist [1]

Politics after Modernity

There is a sense in which the three scenarios I have sketched above could be seen as illustrating respectively the local the national and the international where the three terms are seen as embodying some sort of hierarchy of situational scope of power, and perhaps even of value (provincial to the cosmopolitan/universal, in some perspectives) This is certainly the "common-sense in India", and its logic is evident in the first two scenarios The national-secular or the secular-modern is often marked off in relation to the local The latter to be sure is valorised but only by the former, the self valorisation of the local is regarded with suspicion, if not outright hostility [17] However that may be, what interests me primarily in the three scenarios is, as I have tried to mark out in my discussion of each of them, a certain impasse that is common to all of them It is an impasse that results from the loss of a certain dominant conception of the political, a conception so dominant as to be considered, or mistaken for, the political itself Precisely because this conception still dominates our horizon – to such an extent that its crisis seems to signify the loss of the political itself – it is important to analyse how the impasse comes about in the way that modernity is staged in each of the scenarios

Ananthamurthy, as we saw, leaves us with an aporia – the divide or doubling between the author and Venkata seem unresolvable Since the figure of Venkata is presented as a critique or a self-interrogation of the modernist identity programme to respond to which the latter seems to have no resources left the story might be seen as gesturing toward nativism as postmodernism whose theoretician would be Ashis Nandy Yet the story manages to something that Nandy's critique of modernity is unable to do namely to show the figures of both Venkata and Ananthu (the author) as generated by modernity the aporia, in other words is internal to modernity itself What the story shares with Nandy's theory is a certain valorisation of the folk', the rural the pre- or non-modern cultural practices without realising that such a valorisation is indeed a symptom of the loss of the political The valorisation is indeed an attempt to posit certain kinds of *agency* as an aesthetic/political value without however ever making clear what politics might be elaborated by such an agency If the suggestion is that such an agency embodies anti modernity which is a form of politics – then it would have to be shown what concepts and what forms of political sociability such an agency can enable In the absence of any such reflection if not theorisation we are left with the aporetic divide between our culture – the authenticity of our identity – and their politics – the cause of the alienation or diremption of our authenticity Such a nativism if it is the right word simply concedes modernity its self interpretation (if only to reject it) without reflexively theorising the historicity the historical experience that has made us what we are of our modernity our discrepant, non-contemporaneous relationship with our present To set up therefore modernity as external and alienating, as Nandy does or to show it as generating a divide a doubling in order only to valorise the doubled part as a critique of modernity, is to evade or even to suppress the loss of the political brought about by the crisis in the social imaginary of modernity

Geeta Kapur's resolution seems at first to be the most unambiguous, she is not troubled, as Ananthamurthy clearly is, by the identity programme of the modernity project (including its leftist version) In fact, she would deny that the aporia as it emerged in the first scenario is intrinsic to modernity While her programme is outlined in the most orthodox terms – the creation of a historical avant-garde out of the ideology of left modernism its idiom is said to be 'swadeshi The need, therefore, is to invent or reinvent a tradition and make it tradition in-use Yet the resolution she proposes avoids the splitting of the subject that occurs in the first scenario only at the cost of redoubling the nation into the modern and vice versa The politics of left modernism ends up reiterating or supplementing the popular sovereignty, i e, nationalism, of the nation-state And the notion of the tradition that she constructs as the historical condition of possibility of an avant-garde may have already lost its legitimacy (which is precisely why it appears monolithic and imposed) It is the force and validity of these questionings that she must repress in order to articulate her prolegomena for any future left modernism that will be able to present itself as an avant-garde Thus the identity programme articulated by the conjunction, or better still, the chiasmatic exchange, between nationalism and left modernism leaves no space to sustain a radical politics Once the nation-as-subject is seen as both the ground and the telos of left politics/aesthetics the latter will inevitably let the former reoccupy its space and its project The result is the loss of the political and this loss is covered over when the issue is seen as the defence of sovereignty against a cannibalising postmodernism A large part of the problem in the way Geeta Kapur conceives of her project lies in the way she abstracts from a specific historical experience of Europe and tries to give it swadeshi content rather than beginning with an interrogation of that content to determine what could be a radical politics or aesthetics that could define our present In some ways her project is the symmetrical obverse of Ananthamurthy/Nandy's If they hold on to culture as our content and reject the form as alien, she accepts that form (which is also a norm) as necessary and desirable and tries to shape the content (culture) into that form Both repeat the founding split of nationalism – culture and politics A politics of culture comes to stand in for a radical politics that can both expose the contingency of instituted forms of politics and open up new forms of political sociability [18] Ironically, therefore, the foregrounding of culture by both left modernists and nativist modernists can be seen as a symptom of the loss of the political

Appiah's 'story' allows us to relocate or rearticulate some of the aporias of our previous scenarios What I take to be most valuable in Appiah is his argument, or, rather, the implication of his argument, that the work', as it were, of modernity is over It is no more an ideal to be striven for or a telos to be realised, to do so as Geeta Kapur does is to be caught in the modernist interpretation of modernity Once we reject that, we can see the neo-traditional artist as well as Venkata as inhabiting our present, demanding a political response rather than an aesthetic attempt to redeem and recuperate them or a post-political gesture of simply

acknowledging their space and their 'less anxious' creativity And perhaps because the nation-state has already disintegrated in Africa, Appiah is able to see through the traps of nationalism (although in the process he conflates the nation, nationalism and the nation-state) Perhaps the illusions of political modernity have lasted longer in India (as we saw with Geeta Kapur) or it may be that the narratives of citizenship have not undergone the same wrenching disidentification or disinvestment as in Africa and therefore still retain their political possibilities Furthermore the logic of the space clearing gesture that implicates postcolonality in a specular relationship with the west alerts us to the dangers of undertaking the "provincialisation of Europe as in intellectual task [19]

Yet when Appiah posits a divide between the comprador mediators of modernity located or relocated now in the multicultural space of the US and the less anxious' creativity of the anonymous artist, he displaces the problematic of postcolonial politics Although clearly sympathetic to some form of left politics he leaves to caricature a Wittgensteinian dictum, everything as it is Or rather for him the hope clearly lies with the subaltern artist unlike Ananthamurthy who hesitates to so unambiguously place any hope on Venkata's way of life rather than with the kind of politics or creativity engaged in by people like himself (or myself or Geeta Kapur or Ananthamurthy) The question raised by Appiah's displacement is not simply that he exempts himself from the political (creative) impasse but that he never examines the political vocabulary and subject position that compels him in the first place to set up the problem in that particular way We are confronted then with the same kind of aporia that we saw emerge in Ananthamurthy s figuration of Venkata and in Geeta Kapur's figuration of the avant-garde project/subject, even though the route to it has been radically different Appiah s staging of this particular 'story however posits the anonymous artist as the double of the mediators of modernity (a category that, I take it, includes the author himself) between whom one cannot envisage any kind of relationship, that is to say since one is not talking about direct relationship, what possible politics can relate the two? The problem with invoking humanism is that it simply depoliticises – its invocation, possible *an*where and *an*time absolves one of evolving concepts that tell us what we are and how we are related to one another Appiah's rejection of the modernist conception of politics seems, therefore, to imply a rejection of politics *tout court*, and the postcolonial appeal to humanism begins to look suspiciously like a gesture toward post-politics [20]

What is at issue is not, obviously, the creativity (anxious or not) of subalterns in the face of unimaginable adversity Nor is the issue of postcolonality about whether we will have genuinely Ghanaian or Indian novels or art-works (a question which perhaps necessarily embodies a nationalist ethos and its essentialism may in fact be open to appropriation by the difference producing machinery of postmodernism) Nor, lastly is it a question of what Ananthamurthy/ Appiah should do about Venkata/the anonymous artist and his habitus apart that is from placing their hopes – political as well as creative on them The issue is really this given that the postcolonial spaces (India Ghana or Kenya) are in the state they are their precarious position in the world economy the crisis of the state and of the history/discourse of their sovereignty as nations how do any of the practices and institutions that derived their legitimacy from modernity interrogate themselves in such a way that the problems created in large part by the very logic of modernity itself can become the focus of a politics?

One conclusion that we could draw from the impasses that we witnessed in the three scenarios would be that today it is impossible just to be a nativist postmodernist or a modernist leftist or a nationalist or a postcolonial humanist To say this is not to imply either some fragmented subject position or a liberal 'multiculturalist' (and a multipoliticist) position which tolerates all these positions It is to recognise the non coherence of our present experience and the deeply conflicting idioms with which we struggle to decipher its reflective possibilities The coherence was achieved by the modernist interpretation of modernity the belief in progress and the confidence that reason could organise and order our cultural and social world and the belief that true universality would be achieved when all human practices could be brought under the rule of reason By rejecting that interpretation one is not rejecting reason but to use a very Kantian formulation the illusions of reason The many forms of reasoning underlying our diverse practices cannot always be abstracted from those practices As Wittgenstein and Heidegger, in their different ways showed, reasoning itself is a form of practice, embedded in a form of life, although not identical with it Once we give up the desire for that kind of coherence – the false coherence, as we might be tempted to put it now – we are faced with the task of constructing a politics no longer derived either from philosophy or history or from the dictates of reason standing outside the practices and claiming to replace them The task is all the more daunting since among other things this politics will have to make reparation for the very interpretation of modernity whose own institutional logic is so pervasive and deeply embedded For the people of the left (to use a deliberately fuzzy expression) – the addressee of this essay – the task is, then, to rescue the project of communism and its promise of an egalitarian and democratic society from its forcible reoccupation by both modernity and varieties of nativism/nationalism This would mean not a deliberate pursuit of non coherence, but the eschewing of forms of coherence that do violence to and delegitimise practices that give us what reasons we have for reflection and action [1] We need to undertake therefore, the construction of coherences and idioms that will involve us in an exploration of the reflective possibilities of our practices which include, it is needless to add or repeat, the cultural and political practices of our modernity

Notes

[This essay took shape as a presentation to the Social Science Forum University of Hyderabad Subsequent versions have been given as talks at the Department of English University of Melbourne Department of Communication University of Illinois at Urbana Champagne and Centre for Studies in Social Sciences Calcutta I would like to thank Tapati Guha Thakurta M Madhava Prasad Partha Chatterjee Ashish Rajadhyaksha and Dipesh Chakrabarty for their comments Tejaswini Niranjana as always helped me to give the article coherence and closure]

1 Although this essay is self standing some of the claims I make about modernity here are given theoretical elaboration in my Our Time History Sovereignty and Politics *Economic and Political Weekly* Vol 30 No 6 February 11 1995 pp 317 24

2 I use the term in the sense given to it by Michel Foucault Problematisation does not mean the representation of a pre existing object nor the creation by discourse of an object which does not exist It is the whole set of discursive and non discursive practices which causes something to enter into the game of truth and falsity and constitutes it as an object for thought (whether this be in the form of moral reflection, scientific knowledge political analysis, etc) The Regard for Truth Interview between Michel Foucault and Francois Ewald , *Art and Text*, Vol 16 Summer 1984-85 p 25 Foucault saw his genealogy essentially as an attempt to investigate 'the condition in which human beings problematise' what they are, what they do and the world in which they live". *The Uses of Pleasure*, Vintage, New York, 1985, p 10

3 Cited in Paul Gilroy, *The Black Atlantic Modernity and Double Consciousness*, Verso, London, 1993, p 1 For a brief discussion of Glissant's work, see Vivek Dhareshwar, Toward a Narrative Epistemology of the Postcolonial Predicament', special issues on 'Travelling Theories, Travelling Theorists', James Clifford and Vivek Dhareshwar (eds), *Inscription*, Vol 5, 1989, pp 135-57, and Vivek Dhareshwar,

'The Predicament of Theory' in *Theory between the Disciplines: Authority, Vision, Politics*, Martin Kreiswirth and Mark A Cheetham (eds), University of Michigan Press, Ann Arbor, 1990, pp 231-50.

4 Kwame Anthony Appiah, 'Is the Post- in Postmodern the Post- in Postcolonial?', *Critical Inquiry*, Volume 17, Winter 1991, p 341 All further references to this article, abbreviated PP, will be included in the text A revised version of this article, entitled 'The Postcolonial and the Postmodern', appears in his *In My Father's House: Africa in the Philosophy of Culture*, London, 1992 I have preferred the earlier version mainly because of its sharpness which is somewhat compromised by the author's attempt to elucidate postmodernism with textbookish examples in the later version

5 U R Ananthamurthy, 'Suryana Kudure' in *Aavdu Entu Kathegalu*, Akshara Prakashana, Sagar 1984 I have used the translation by Manu Shetty and A K Ramanujan, 'A Horse for the Sun', *India International Centre Quarterly*, Volume 19, No 3, Monsoon 1992, pp 99 126 All further references to this work, abbreviated HS, will appear in the text 'Suryana Kudure', the Kannada word for grasshopper, literally means 'the sun's horse' As will be obvious, the translators have wisely opted for the literal rendering

6 Geeta Kapur, 'Contemporary Cultural Practice: Some Polemical Categories' *Social Scientist*, 202 Vol 18, No 3, March 1990, pp 49 59 (cited in the text henceforth as CP), 'Place of the Modern in Indian Cultural Practice', *Economic and Political Weekly*, December 7 1991, pp 2803-06 (cited as MIP) Although my analysis will largely focus on these two essays I shall, where appropriate, draw on her 'Articulating the Self into History Ritwik Ghatak's *Jukti takko ar gappo*' in *Questions of Third Cinema*, Jim Pines and Paul Willemen (eds), London, 1989, pp 179-94, 'Ravi Verma The Representational Dilemmas of a Nineteenth Century Indian Painter', *Journal of Arts and Ideas*, Vol 17-18, June 1989, pp 59-80, 'Further Narratives', *Journal of Arts and Ideas*, Vol 20-21, March 1991, pp 99-104, 'Cultural Creativity in the First Decade The Example of Satyajit Ray', *Journal of Arts and Ideas*, Vol 23-24, January 1993, pp 17-50; 'Body as Gesture Women Artists at Work', paper presented at the conference on Subalternity and Culture organised by Anveshi Research Centre for Women's Studies/Subaltern Studies, Hyderabad, January 1992; 'When was Modernism in Indian/Third World Art?', *South Atlantic Quarterly*, Vol 92, No 3, Summer 1993, pp 473 514

7 Given the nature of the texts I deal with, it may be useful to clarify at the outset that I am not concerned, except marginally, with the politics of the aesthetic I will not be, in other words, dealing with issues such as the politics of literary modernism or the politics of avant-garde art practices. [I have in mind works such as Raymond Williams, *The Politics of Modernism*, (Verso, London, 1989); Peter Burger, *Theory of the Avant-Garde* (University of Minnesota Press, Minneapolis, 1984) and *The Decline of Modernism* (Pennsylvania State University, University Park, Penn, 1992).] Such works are urgently needed in India Geeta Kapur's own work has been important in opening up this field for theoretical examination. For a historical reconstruction of the transaction between nationalist politics and the aesthetics of the Bengal school, see Tapati Guha-Thakurta, *The Making of a New 'Indian Art'. Artists, Aesthetics and Nationalism in Bengal, 1850-1920* (Cambridge University Press, New Delhi, 1992) For an attempt to characterise literary modernism in Kannada, see Tejaswini Niranjana, 'Whose Culture is it? Contesting the Modern' in *Journal of Arts and Ideas*, Vol 25-26, December 1993 My interest here, on the contrary, is exclusively on the political as it figures in the texts I examine

8 As Jacques Derrida puts it in his discussion of the question of the subject, "Moreover, one could put the subject in its subjectivity on stage, *submit* it to the stage as the *idiot* (the innocent, the proper, the virgin, the originary, the native the naive, the great beginning just as great, as erect, and as autonomous as *submissive*, etc)" ' "Eating Well", or the Calculation of the Subject An Interview with Jacques Derrida' in *Who Comes after the Subject?*, Eduardo Cadava and others (eds), Routledge, New York, 1991, p 99

9 Etienne Balibar and Immanuel Wallerstein *Race, Nation, Class Ambiguous Identities*, Verso, London, 1991, p 4

10 I am here merely drawing out the consequences of Geeta Kapur's own assertion about the complicity between the state and modernism in India in her 'Cultural Creativity in the First Decade the Example of Satyajit Ray', p 18 My remarks in the text raise two large questions that I will deal with elsewhere the relationship between modernity and the state, especially in the colonial/post colonial context, and the availability and cogency of 'passive revolution' as a category of explanation

11 Let us note here the exemplary figuring of the contemporary for Geeta Kapur in Ritwik Ghatak ('Articulating the Self into History', p 190) "how to construct a figure that is truly in the process of becoming, in the process of making choices while baiting death, how to figure the archetypal into the contemporary so that it burns with the mortality of the historical subject" " this [figuring the movement of the saint-poets] provides him with a way both to *humble his overriding subjectivity and to give it the power of the collective* For we know that the saint-poets even as wanderers were embedded in the true collective of peasant and artisanal communities and that they rose beyond it, into vanguard positions of reformist and revolutionaries within the larger, hierarchically structured society"

12 This position is very sharply outlined in her, 'When was Modernism in Indian/Third World Art?' where she says: "In India it looks as if there is a modernism that almost never was, neither in terms of the secular nor in terms of the avant-garde sublime. Where, then, shall we seek our position except in a lived historical experience of an imploding sense of sovereignty?" (p 523).

13 I borrow the concept of 're-occupation' from Hans Blumenberg, *The Legitimacy of the Modern Age* (MIT Press, Cambridge, Massachusetts, 1983) In this magisterial, if ultimately unsuccessful, work, Blumenberg tries to argue that the distinctiveness of modernity, its legitimation claim, in other words, comes into question only because its structure of propositions is reoccupied by problematics that belong to Christianity and which it has no business trying to answer For a philosophically probing discussion of this work, see Robert B Pippin, 'Blumenberg and the Modernity Problem', *Review of Metaphysics*, Vol 40, March 1987, pp 535-57

14 Appiah manages to capture something important in his phrase "modernist characterisation of modernity", even though his interpretation of it remains narrow in that it fails to capture the significance of *political* modernity And because he does not take into account the latter, his interpretation and assessment of postcoloniality ends up simplifying the whole problematic. On the significance of political modernity, see my ' "Our Time" History, Sovereignty and Politics' However, it is possible to show that influential accounts of postmodernity, such as the one by Fredric Jameson [*Postmodernism, or, The Cultural Logic of Late Capitalism*, Verso, London, 1991] or by Jurgen Habermas [*The Philosophical Discourse of Modernity*, Polity, Cambridge, 1985] remain caught in the modernist understanding of modernity Jameson, because he basically sees postmodernism as resulting from the extension of real subsumption (though he does not use this particular Marxian concept) to spheres hitherto excluded, namely, culture, Habermas, because he still thinks of modernity as an incomplete project, that, despite postmodern aberrations, is still worth pursuing For a historically and theoretically more nuanced account that does call into question the modernist understanding of modernity while vindicating modernity itself, see Alain Touraine, *Critique of Modernity*, Blackwell, Oxford, 1995

15 Actually, what he terms postcolonial should really be post-postcolonial, since post-coloniality was an attempt to go beyond colonial modernity by combining nationalism and modernity

16 Albert O Hirschman, *Exit, Voice and Loyalty: Responses to Decline in Firms, Organisations and States* (Harvard University Press, Cambridge, Massachusetts, 1970); also see his recent 'Exit and Voice An Expanding Sphere of Influence' in *Rival Views of the Market Society and Other Recent Essays*, (Harvard University Press, Cambridge, Massachusetts, 1992)

17 I do not have the space here to complicate these remarks We need to investigate the ways in which the enunciative modality of the national-secular is structured in the discursive field of the Indian modern. Not everyone's discourse is authoritatively

national/secular; not everyone can speak for the nation. In the scenarios we have examined, Ananthamurthy's discourse does not attain the status of speaking for the nation he would be seen and he would see himself as working out a regional dialectic. In fact one could argue that whatever his differences may be with Geeta Kapur he would at some level subscribe to her conception of the traditional and the national modern.

But, and this would mark the moment of postmodernity in India now there is a global circuit which turns the geographically regional into the floating neo ethnic the folklorised native into postmodern neo authentic. In his recent story Akkayya (*Udayavani* Deepavali Special Issue 1994 pp 73-83) Ananthamurthy seeks to reflect in a mode that alternates between the ironic and the parodic on the postmodern appropriation of as well as motivation for the nonmodern. The story is structurally and thematically related to Suryani Kudure.

In this again autobiographically structured story we witnessed the author meeting another of his classmates Srinivas is a reputed academic in a university in Philadelphia he is now an active participant in the highly fashionable critique of modernity discourse. He has evolved from progressive Marxism to postmodernism via liberalism and modernism. But at the centre of his consciousness is his elder sister Akkayya now dead. She was a victim of child marriage abused and thrown out by her husband she had returned to her widowed father. After his death she had brought up her brother looked after the house. But her being/activity like that of Venkata embodied a philosophy a distinctive understanding. Akkayya and her world is if you like Srinivas' *smithome* the Lacanian term for the phantasy core that holds together a subjectivity. In fact whatever philosophical position he has taken up in his successful career has been either because he wanted to get away from that world or indeed because he got away from that world. The only thing he would be against is the neo colonialist attempt to denounce her world as a lie. Does the postmodern saleability of Srinivas' critique of modernity compromise the authenticity of his concern? That is the question the story is set up to answer. Since an analysis of this story cannot be undertaken here I merely note that the subject positions of Ananthamurthy/Venkata/Srinivas/Akkayya can be orchestrated within the first and third scenarios I have sketched.

18 As Claude Lefort argues: The political is thus revealed not in what we call political activity but in the double movement whereby the mode of institution of society appears and is obscured. It appears in the sense that the process whereby society is ordered and unified across its division becomes visible. It is obscured in the locus of politics (the locus in which parties compete and in which a general agency of power takes shape and is reproduced) which becomes defined as particular while the principle which generates the overall configuration is concealed" *Democracy and Political Theory* (Minneapolis University Press Minneapolis, 1988), p 11.

In order to refocus the question of the political the left would have to initiate a critique of the modes of instituting the modern society (which we have also been calling the social imaginary) in such a way that the principle itself is called into question. The task seems more plausible and necessary precisely because of the disintegration of modernity as a social imaginary. Let us remember that Marxism is indeed a critique of modernity and that there is nothing paradoxical in demanding that the Marxian concept of an immanent critique be extended to Reason itself. I develop this argument in my "Valorising the Present: Political Languages and the Left" (ms).

19 I am referring of course to Dipesh Chakrabarty's "Postcoloniality and the Artifice of History" *Representations* Vol 37 Winter 1992 pp 1-26.

20 Appiah never makes clear what he means by "non essentialist humanism or universalism". By the same token and with as much or as little justification one could argue for a "non essentialist nationalism". It is in any case a mistake to think that humanism or universalism is incompatible with nationalism. See Jacques Derrida "Onto-Theology of National Humanisms (Prolegomena to a Hypothesis)" *Oxford Literary Review* Vol 14 1992 pp 3-23.

21 S I Hurley has formulated this Wittgensteinian insight particularly well: "The existence of certain shared practices any of which might not have existed is all that our having determinate reasons to say or do anything rests on. Still it is compatible with their existence that other different forms of life also exist." *Natural Reasons: Person and Polity* (Oxford University Press New York 1989) p 37. Also see her discussion of theorising itself as a practice on pp 200-02. In a different but not unrelated, context, Anthony Appiah makes some philosophically subtle suggestions regarding how one might develop the idea of "noncoherence of practices". I am insisting that there is much to be said for the noncoherence of our different practices for the existence of theories that empower and illuminate certain projects in ways that simply say so what to the fact that they contradict other theories that belong to other projects. Once motivated this noncoherence can be seen as both necessary and desirable. Anthony Appiah "Tolerable Falsehoods: Agency and the Interests of Theory" in *Consequences of Theory* Jonathan Arac and Barbara Johnson (eds) (Johns Hopkins University Press Baltimore 1991) p 83. The remarks that I have offered are not to be taken as conclusions they are meant rather to indicate what seems to me to be a fruitful direction in which a theory of the Indian modern can be pursued as a problematisation of our modernity. There are I think clear affinities between what I say here and what I see as the approach underlying Partha Chatterjee's proposal for a critique of modernity in his *The Nation and Its Fragments: Colonial and Postcolonial Histories* (Princeton University Press Princeton 1993). However the idea of the fragmentary recommended by Chatterjee following Gyanendra Pandey remains too metaphoric its metaphorical charge even obscuring its conceptual reach. Furthermore Chatterjee seems to think the fragmentary needs no justification. That raises many complex questions which I shall take up elsewhere. In invoking the rhetoric of the fragment we should as Maurice Blanchot advises us heed Derrida's warning. "There is reason to fear that like ellipsis the fragment makes mastery over all that goes unsaid possible arranging in advance for all the continuities and supplements to come." Cited in Maurice Blanchot *The Writing of Disaster* (University of Nebraska Press Lincoln 1986) p 134.

NEW BOOK FROM **MD** PUBLISHERS OF THE HUMANITIES NATURAL & SOCIAL SCIENCE

MIZO CHIEFS AND THE CHIEFDOM

By
Suhas Chatterjee

1995, 201p, 4 plates, ill, maps, append, bib, gloss, index, 23x15 cm
ISBN 81-85880-72-7 Rs 275.00

The book deals with the cultural heritage of the Mizos, and gives a correct picture about the Chief-ship and Mizo Chiefs who lives in India, Burma and Bangladesh.

The NEP: The Dangers Ahead

Ramaswamy R Iyer

This article brings together in a broad synoptic overview a diversity of concerns relating to the NEP These include the danger of a deepening of the dualism that already exists in India, the possibility of the erosion of some of the strengths and capabilities built up during the last four decades, the need for wariness in dealing with MNCs, and the importance of safeguarding national interests in the face of the inequities of the global market and the pressures of the global political configuration The article argues against a feeling of helplessness and in favour of a constant endeavour to enlarge the space for independent decision-making

I

WHAT the New Economic Policy (NEP) is expected to bring about over a period of time may be summed up as follows a significant increase in the rate of economic growth a substantial expansion of exports large inflows of foreign investment and so on leading to an era of unprecedented prosperity In this article that proposition will be taken as given without further discussion it will also be taken for granted that the NEP will not be reversed to any significant extent and that the only course open to us is to make a success of it applying such corrective steps along the way as may become necessary It will be further assumed that certain common criticisms, such as those relating to the fiscal and revenue deficits the continuing problem of inflation, and the inadequacies of the infrastructure, will be duly attended to by the government What this article proposes to do is to outline briefly and in general terms certain dangers which are now incipient but which may become manifest as the NEP proceeds further Some of the points made here may have been made before by others in different contexts but this article seeks to bring a diversity of concerns together in a broad, synoptic view

A preliminary point needs to be made at this stage The tendency to use the words 'liberalisation' and 'deregulation' as interchangeable is dangerous Liberalisation is intended to mean the transition to a more open, market-driven economy With such a transition there will be need for more regulation, not less The regulation will of course have to be purposeful, efficient, constructive and non-dilatory Regulatory bodies will necessarily have their bureaucracies A distaste for bureaucracy in the pejorative sense of that word should not lead to a hostility to regulatory bodies under the mistaken notion that they are somehow inconsistent with the spirit of liberalisation they are in fact the *sine qua non* of liberalisation The point need not be laboured, as even the World Bank stresses the need for regulation the progress of privatisation in Britain was accompanied by the establishment of sectoral regulatory bodies and in the citadel of capitalism the US are to be found some formidable regulatory agencies such as the Securities and Exchanges Commission and the Federal Drugs Administration It is obvious that without regulation the profit motive and the entrepreneurial spirit – animal spirits as they are sometimes inelegantly and imprecisely referred to – may produce many more scandals like the infamous securities scam It is therefore a matter for some surprise that the distinguished former governor of the Reserve Bank of India should have seen fit in a recent article (*The Economic Times* June 1 1995) to deprecate talk of regulation and raise the bogey of bureaucracy The danger surely lies not in an overstressing of the need for regulatory bodies but in a disingenuous acknowledgement of that need (as a point that needs to be conceded in order to make the NEP acceptable) without any serious intention of providing for effective regulation and indeed with every intention of impeding the functioning of such regulatory bodies as are established (as happened initially with SEBI) Having got that point out of the way, this article can now proceed to its main theme

II

The first and most evident source of misgiving is the fact that while India may possibly become more prosperous under the NEP, it does not follow that it will become a more just and humane society, or that there will be a dramatic reduction of poverty The danger here is that the divide between the upper classes and the poor will widen further, sharpening the dualism that already exists in India The 'trickle down' effect, (assuming that it works) may take a long time Meanwhile as the lifestyles of the middle and upper middle classes change dramatically and begin to resemble the lifestyles in the affluent west or their images as seen on the ubiquitous TV, the drab lives of the poor will seem even drabber and harsher their poverty and deprivation will be accentuated by contrast Unless the policy-makers heed the needs of the vast masses of this country (around 700 million) and not merely those of the rich and the middle classes (estimated variously at 150 to 300 million), social unrest could take potentially dangerous forms While measures such as basic needs programmes, public distribution systems some forms of social security employment generation schemes and so on may mitigate hardship and improve the lot of the poor, the dualism in the country may still remain sharp One wonders whether anything can be done regarding this without invoking ideas which may run counter to the new philosophy

III

The second danger to take note of is the possibility of the gradual loss of strengths, capabilities and skills built up assiduously over four decades Whatever the errors and deficiencies of the old policies, it cannot be denied that they did result in the creation of a strong, highly diversified industrial base. A concomitant to this was the emergence of a fine skilled workforce and a strong body of industrial technological and managerial manpower These are the strengths of the Indian economy as it embarks on the new paths charted by the NEP these are among the features which interest the potential foreign investors and these are what enable us now to talk about collaborations and joint ventures With the dismantling of import, exchange and investment controls, and with the progressive reduction of customs duties, Indian industry will face severe competition Competition is one of the cardinal principles of the new philosophy it is expected to put pressure on the Indian industry for bringing about improvements in quality and cost-reductions and thus benefit the consumer. In principle that may be desirable, but we cannot ignore the fact that (apart from the time needed for adjustment and the stresses involved) the competition may in many cases be unequal and non survival may not necessarily warrant the conclusion of inefficiency Can Indian industry, however efficient take on giant MNCs with their command over astronomical resources, their vast R and D establishments their tremendous marketing strength and their global reach? Apprehensions on the part of Indian industrialists on these grounds are usually dismissed derisively as a hankering after the sheltered conditions of the past and perhaps there is a measure of truth in that criticism, but there is real problem here Unfortunately, there seems to be little concern among the policy makers and their academic supporters for the retention of the achieved strengths and capabilities

The question is not merely one of import liberalisation and its impact on Indian industry changes in internal industrial policies will also create some problems.

Earlier policies of reservations, soft loans, tax concessions, and so on, have contributed to a remarkable growth in the small scale sector There have been some related problems which we need not go into here The point is that small-scale enterprises are today important actors on the Indian economic scene, employ large numbers of people and contribute significantly to India's exports As the old industrial policies change, and some of the special measures favouring the small-scale sector disappear, small-scale entereprises will come under stress Some commentators fear that the competition from the Indian large scale sector and from imports may result in the decimation of the small-scale sector, such fears may be exaggerated, but there is hardly any doubt that the small-scale sector will face severe difficulties under the NEP While th old protective regime cannot be maintained indefinitely small-scale industries may need some assistance in making the transition to the new situation Similarly, dairy development (which has made remarkable strides in this country) has been deliberately brought about (largely) under a co-operative form of organisation Delicensing and the advent of the organised industry into this area may present severe challenges to the co operatives Another matter of special concern is the peculiar situation in which public enterprises as a class find themselves under the NEP and the indifference of the government to their problems, but that is too large an issue to be discussed here

The point that is sought to be made is that the strengths and capabilities already built up, whether in the organised industry (public and private), or in the small scale sector or in the co operative field, are in some danger of erosion and decay under the new dispensation, and that some care needs to be taken to avert that danger What is being advocated is not a return to old style policies but the kind of supportive relationship between the government and indigenous industry that has prevailed in Japan South Korea etc It is by now generally accepted that the 'East Asian Tigers' achieved their successes not through a blind faith in market forces but through a purposeful kind of state intervention

In passing it may also be mentioned that 'liberalisation freedom from red tape' 'the loosening of the bureaucratic stranglehold', etc, which are claimed as the great virtues of the NEP, are essentially meant for the organised (private sector) industry the NEP takes hardly any notice of those outside that charmed circle

IV

Another area of concern arises from the advocacy of agricultural exports The argument is that Indian agriculture has suffered because of low prices and movement restrictions and that the Indian farmer should be allowed to realise the benefit of the best international prices But what will happen to our food security under those circumstances? It may be argued that India can simultaneously export some agricultural products and import others We can of course export some superior varieties of rice (basmati) and import medium varieties, but this can only be a limited proposition Considering the projected magnitude of our future food needs, self-sufficiency in foodgrains makes some sense for India, we have to be careful about allowing exports of foodgrains freely and hoping to meet shortages through imports The export of vegetables, fruits and the products of agro-based industries is certainly a good idea but even here the needs of the domestic market cannot be totally ignored In the last year or two, a substantial part of Indian coffee production has been exported to fill the gap created by the failure of the Brazilian crop As a result there has been a shortage in the domestic market and coffee prices are very high the price today is about four times the price which was prevailing two years ago This is causing serious difficulty because in south India everybody (not merely the rich) drinks coffee it is regarded as a necessity of daily life It is hardly possible to tell them that coffee is not a necessity and that they could drink tea instead What has happened in the case of coffee can happen in the case of some other agricultural commodities as well, if agricultural exports were freely allowed At the same time, it may go against the grain of the new economic philosophy to impose any restrictions on exports There is no easy answer to this conundrum Suitable policy responses will have to be found to situations as they arise

There is also the question whether the free operation of market forces and the higher profitability of certain non-foodgrain crops (if that be the case) may lead to a diversion of acreage from foodgrains to those crops, whether this should be accepted as inevitable and natural, or whether such an eventuality can and should be obviated through appropriate policy measures, and if so what those policy measures may be Those questions will lead us into a full scale discussion of agricultural policy as a whole, which cannot be attempted here It needs to be said, however that in general the supporters of the NLP who advocate the extension of the market forces philosophy to agriculture do not appear to have thought through the complexities involved

The 'opening up' process renders India increasingly vulnerable to external financial turbulence In the past, the Indian capital market was relatively isolated If stock markets crashed in Japan or the US, there was no immediate impact on the Indian capital market That position has changed The Indian capital market will in future feel the effects of developments elsewhere Similarly the problem of 'hot money' flows was of no concern to India earlier, but today India is as vulnerable as any other country and this vulnerability will increase when the rupee becomes convertible on capital account in due course Further while we may take satisfaction in the increased inflows of foreign investment funds into India, foreign direct investment (FDI) is only a small part of this, a significant part of the inflows is in the form of portfolio investment, which is not real investment but merely the inflow of finance capital However, these are familiar points which do not need to be laboured The ministry of finance and the Reserve Bank of India may be presumed to be well aware of these matters

A more important question is one of control With the removal of the old restrictions on the extent of non-Indian equity in Indian companies, foreign principals have been increasing their holdings in many cases The control which had earlier been wrested with some difficulty from MNCs may now pass back into their hands Companies which are wholly Indian may also get foreign shareholders either through portfolio investment by FIIs or through equity subscription by the foreign collaborators Indian companies finding it difficult to compete with large and powerful foreign business houses may seek foreign collaboration arrangements including equity investments, on the principle of 'if you can't beat them join them' Over a period of time many Indian companies may become subsidiaries or even divisions of foreign companies or MNCs

MNCs are also being welcomed with open arms into crucial and sensitive infrastructural areas such as power generation hydrocarbon exploration and refining and so on Promising oil fields discovered by ONGC are being handed over to foreign companies for development and exploitation that is to say for making money without taking any risks Private including foreign investment in the power sector is being invited on terms and conditions which seem adverse to India's interests Even the World Bank has questioned the kind of tariffs, guarantees and counter-guarantees that India has been offering in order to attract foreign investment in power generation Apart from this, it is ironic that the 'commanding heights' of the economy which were once supposed to be occupied by the public sector and from which even the Indian private sector was excluded, are now being energetically and enthusiastically handed over to MNCs!

There are other issues relating to MNCs which can only be mentioned in passing here for instance, the questions which the entry of MNCs into the areas of agriculture and agro-processing gives rise to, the questionable social value of their entry into industries such as soft drinks, breakfast foods, potato chips etc, and the large outgo of profits which may arise from this, the lavish remuneration packages that MNCs offer to their employees, the enormous sums they are prepared to pay in urban areas for office and residential accommodation, and the impact these may have on salary levels, real estate values and rentals, and so on

Past Indian fears in regard to MNCs might have been exaggerated and might have resulted in control measures which stultified

cannot be dismissed as entirely imaginary. It was not merely India that feared MNCs a concern about MNCs was fairly widespread not very long ago, and there was even a move under UN auspices to formulate a code of conduct for MNCs One does not hear much about this any more but that concern has not ceased to be relevant Some wariness in this regard will not be out of place

Unfortunately, instead of wariness there is some danger of collusion The new beliefs in the inherent efficiency of the private sector the importance of FDI the imperative of globalisation and the desirability of inducting private capital (domestic and foreign) into the infrastructural areas provide wonderful opportunities for large-scale corruption, individual and political One of the criticisms of the old system was that controls tended to breed corruption but the new policies seem to offer scope for corruption on a scale unheard of before It may be argued that corruption is a separate phenomenon and not a concomitant of the NEP but it would not be unfair to say that the NEP increases the opportunities and the temptations

VI

Lastly attention needs to be drawn to a particularly insidious danger A naive belief in market forces and the virtues of international trade and the spell cast by the idea of globalisation should not hypnotise us into imaging that the global market place is characterised by equity or fair play or any special consideration for the needs and aspirations of the poorer countries The Brandt Commission the idea of a New International Economic Order the Cancun Conference the South Commission and so on have now become ancient history There has been a decisive reassertion of western and in particular American dominance over the World Bank and the IMF, and even in United Nations the third world countries have lost whatever little influence they had acquired the UN is in danger of becoming a body which ratifies and legitimises American decisions taken in America's interests (That at any rate seems to be the objective of the US) The functioning of the new World Trade Organisation is not likely to be very different Moreover, the US proposes to retain its own powers of unilateral action under its national laws such as the Super 301

India will be under constant and relentless pressure to open up its economy more and more, conform to American expectations on Intellectual Property Rights and so on at the same time India's access to the American and European markets will face all kinds of difficulties arising from matters unrelated to trade Legitimate concerns such as environmental protection human rights, labour standards, the protection of children from exploitation health and safety norms, and so on, may be misused as protectionist measures The political and security objectives of the US in regard to matters such as the nuclear non-proliferation treaty (NPT) ...ology Control Regime (MTCR) may also be pursued through pressures on the trade front Thus, the potential that the NEP may hold for bringing about an expansion of India's exports and an increase in prosperity is conditional on India's 'good behaviour' in the eyes of the US, Europe and Japan over a wide range of issues If India displeases them on any of these matters doors may be closed to India's exports and investment flows into India may dry up On the other hand, if India conforms fully to the expectations of the US and gains increased access to the American market and increased flows of American investment into India, that too is not without its dangers Indian economic activity will become crucially linked to the US, and the importance of the US connection and fears of jeopardising it may reduce India's capacity for independent action still further (To some extent that inhibiting factor is already in operation)

We must not forget that following the end of the Cold War and the emergence of the US as the world's single superpower, it is that country's declared policy to maintain American supremacy and to ensure that American economic and security interests in any part of the world are not threatened by the emergence of relatively strong regional powers 'Strong in this context refers not merely to military strength but also to economic strength Any country which becomes industrially and technologically strong has the potential of developing military strength it follows that control must be exercised not only over weapons capabilities but also over the growth of the industrial and technological base that provides the underpinning for such capabilities Serious impediments will therefore be placed in the way of technology development in India through stringent controls over technology transfers and over the exports of a wide range of equipment and materials to India, invoking the dubious concept of 'dual use'

Pressures of the kind mentioned would have been exerted on India anway, regardless of whether India had embarked on the NEP or not they have not arisen *because* of the NEP But the NEP with its stress on FDI and on globalisation and the abandonment of the old notions of self reliance as being autarkic , increases India's vulnerability to external pressure India will no doubt have to learn to live in an increasingly difficult world and safeguard her own interests to the best of her ability The short point is that a concern for national interests has not been rendered irrelevant by the idea of globalisation To echo Cromwell's famous remark "Put your trust in God in this case, the market forces philosophy' and keep your powder dry"

VII

To cautions and criticisms of the kind outlined in this article, there are certain standard responses The first is to ascribe them to an antipathy to the NEP That is not necessarily true Even some supporters of the NEP can and do share some of the concerns set forth in this article. The proper course is to look at the validity of the concerns and not at the putative attitudes behind them. The second response is to say that the fears are greatly exaggerated and that even if problems of the kind anticipated do arise they can be easily dealt with Possibly; but before we deal with them we must first fully understand and appreciate the incipient dangers This article is intended as a contribution towards that end

The third response, often accompanied by impatience, is that there is no alternative to the NEP and all that it entails This may be elaborated as follows What choice do we have? Can we opt out of the WTO? If we want infrastructural development and are short of capital, can we afford to drive a hard bargain with MNCs? May they not lose interest in India and go elsewhere? Can we afford to take on the world's single superpower? Should we jeopardise our exports to the US the flow of US investments into India and (given the influence of that country) even the flow of funds from or under the aegis of the World Bank/IDA/IMF? If we antagonise the US, is it not possible that we may even face the prospect of UN sanctions?"

To many that series of rhetorical questions will seem quite persuasive The temptation to succumb to the dictates of the powerful, accept subordinate position, abandon visions of industrial and technological strengths as being ideas above our station, receive the accolade of western approval, and reap the reward in the form of prosperity, will be very strong The pressure in favour of such a choice from those sections of our elites (bureaucratic economic industrial, intellectual) who cherish their sense of belonging to the corresponding international elites will be insidious

However one hopes that there are others in the country to whom such a feeling of utter helplessness such abject surrender, would not appear either acceptable or inescapable. Within the constraints and limitations of the present world situation, it should still be possible for us to try and safeguard national interest and honour, provided we are vigilant and make use of every opportunity of enlarging the space for independent policy formulation and decision making At any rate we have to keep trying to stretch the limits and not give in tamely through a mistaken sense of realism and occasionally we must be prepared to accept some disagreeable consequences Such an effort will not be easy but it needs to be made It is in the hope that such a point of view, if explicitly stated in simple terms, will find some response (not merely among the diminishing numbers of people who are opposed to the NEP but also among the supporters of the new philosophy) that this article has been written

[I am grateful to Chetan Vaidya for some useful comments on a draft of this article Needless to say he bears no responsibility for what has been written here]

REVIEW ARTICLE

A Marxian Social History beyond the Foucaultian Turn

Sumit Sarkar

The London Hanged: Crime and Civil Society in the Eighteenth Century by Peter Linebaugh Penguin, London, 1991, 1993

A STUDY of crime and capital punishment in 18th century London might seem to be of interest only for a very specialised readership Its appeal even within this limited circle may be in danger of diminishing further after the charges of factual inaccuracy made by Sir Keith Thomas Regius Professor of History at Oxford [1] Such constrictions of readership however would be extremely unfortunate, for *The London Hanged* happens to be a book of quite exceptional importance for historiography intellectual life in general and indeed contemporary politics The alleged errors concern matters of detail that must be left for evaluation to specialists of 18th century history though Linebaugh has come forward with what appears a convincing reply I feel, however that the importance of the basic arguments and hypotheses he has formulated would be little diminished even if some of the charges of inaccuracy be found valid Professional historians have found some factual errors and inadequacies in Foucault s studies of madness and incarceration without this seriously undermining the profound impact of *Madness and Civilisation* and *Discipline and Punish* (A comparison, or more precisely counter point, I intend to argue, that is particularly relevant because Foucault is the implicit interlocutor of much of *The London Hanged*)

Linebaugh had been a student of Edward Thompson at the Warwick Centre for the Study of Social History and some will remember him as a co author with Thompson of Albion s *Fatal Tree Crime and Society in Eighteenth Century England* (1975) That had been a significant landmark in the development of Thompsonian' social history, its point of entry together with Thompson s own *Whigs and Hunters* published the same year into an 18th century England so long construed in terms of unruffled paternalistic gentry rule or factional squabbles among the elite The British Marxian historiography of Hill Hobsbawm Hilton, and Thompson possibly the best and the most influential academic historical work produced by Marxists anywhere – had then been at the height of its prestige, providing inputs into the 'histories from below' that were coming into vogue in many parts of the world (It was an important impulse, for instance behind the formation of the Subaltern Studies project, even though the latter has acquired a very different dominant trajectory today) But intellectual moods are now qualitatively different so much so that the *Economic History Review* feels obliged to locate Thompson s *Customs in Common* (1991) as 'part of a romantic, empathetic historiographical tradition which is no longer useful" having become outmoded in the eyes of current students [in] the ideological and research climate of the Thatcher years "[4] It is symptomatic therefore that some of the hostile comments evoked by Linebaugh s book in reviews very different from Keith Thomas scholarly critique uses a cold war language that is triumphalist (Marxism surely being at last dead and gone safely buried with the Soviet Union) and yet curiously nervous in the very violence of its abuse Thus one reviewer is irritated by 'the introductory references to Marx and Malcolm X' and dismisses *The London Hanged* as 'relentlessly tendentious essentially an unsuccessful effort to reassert the discredited assumptions of an outmoded historiographical tradition "[5] Another a historian who is also a Tory politician, is angry because though Lenin's tomb may be under threat the historical certainties of Marxism lie undisturbed "[6]

The anger is understandable, for Linebaugh remains an unrepentant Marxist What is much more important he is an exceptionally creative one who has triumphantly vindicated the best kind of Marxian social history of the 1970s precisely by going beyond it appropriating themes and spaces which it had tended to neglect

The changes in historiographical moods have often had an appearance of naturalness, of an inevitable coming to terms with new circumstances and pressures The hopes of radical transformation through popular initiative once aroused by happenings like Vietnam May 1968 the Prague Spring or US anti war and civil rights movements had ebbed away by the late 1970s and early 1980s Interest and empathy for rebellions and transformations from below' now appeared excessively romantic and attention shifted towards studies of power structures and assumptions of inexorable all pervasive cultural hegemony a mood expressed most profoundly by Foucault Thus as Linebaugh points out in his introduction, the study of crime within a broader framework of social history that had started with Hobsbawm s social bandits' and Rude s crowd' was interrupted and reversed soon after *Albion s Fatal Tree* It was displaced by 'a conservative orientation that considered methods of preventing crimes rather than the circumstances giving rise to them that accepted the inexorability of the legal juggernaut that fascinated itself with state power and that doubted the existence of classes Resistance tended to be relegated to the domain of the purely fragmentary and episodic to carnivalesque moments of inversion and licence Crowd responses to the Tyburn public hangings in London for instance were interpreted as mere raucous spectacle a carnival that ultimately reinscribed a deeper community (pp xvii xix) In a parallel move, the necessary rejection of economic reductionism that Thompson had inaugurated was transformed into a holy fear of matters economic' and avoidance of questions of production and production relations Foucault's masterly studies of modern institutions of disciplinary power – asylums, clinics the army, schools, prisons – mentioned factories only in passing, and remained significantly silent about business firms and multinational corporations

Western', and eventually all Marxism simultaneously came under attack for its alleged Euro centrism' – a charge that could appear to be particularly damaging for a social history, the foundation-text of which

of the 'English' working class, written moreover by a historian who subsequently spoke with some pride in a famous polemic about the 'peculiarities' of the English Hobsbawm apart, the great masters of British Marxist historiography have admittedly written little on empire Such inadequacies came to be felt more deeply in the new era of vastly intensified globalisation resurgent neo-colonialism and racism and the rise to unprecedented prominence of expatriate third world intellectuals located or seeking location in, western universities There was, it needs to be emphasised a real absence here, which helps to explain what can be summed up in shorthand terms as the shift from Thompson, not just to Faucault but even more sometimes to Edward Said But the critique of colonial discourse' tends to be marred by displacements of its own, for which the old bogeys of crude Marxism and economic reductionism once again serve as justifications It has so far added little or nothing towards the understanding of the realities of contemporary transnational capitalism preferring to recite endlessly the grand narratives of 19th century western cultural domination through Macaulay and English education which at least in the Indian context should have become by now tediously familiar The old predominantly Marxist critique of imperialism has been replaced by a focus on race and culture, firmly abstracted from class and production It is tempting to suggest some broad correlations here with the lived experiences of migrant non resident intellectuals for whom racial discrimination and questions of ethnic identity tend to have greater immediacy than class[7]

The post modernistic moods that underlie Foucault, Said and a host of influential contemporary thinkers have often gone along with a subjectively radical orientation It is becoming increasingly clear, however that a narrow 'culturalism' which in effect detaches the critique of Enlightenment rationality and colonial discourse from the structures of capitalism and imperialism is 'inherently incapable' of resisting the current global advance of 'free'-market neo-liberalism, an ideology, incidentally, that can claim quite impeccable descent from the Enlightenment, but somehow manages to escape detailed critique in the anti-rationalism campaign[8] Empathy for the 'moral economy' of peasants and artisans, and projects that try to rescue the wretched and the defeated of past generations from "the enormous condescension of posterity", in Thompson's once oft-cited phrase, are likely to receive short shrift amidst today's hosannas for rampant consumerism and unrestricted *laissez-faire*

The London Hanged deliberately seeks to go against this tide of current orthodoxy it "gives us exceptional insights, pitiless and without moralising, into the conditions of labouring life among those whom the consumer society consumed"[9] Its principal data-base consists of the biographies of 1,242 men and women hanged at Tyburn, London, between 1703 and 1772 compiled and published by the jail official known as the Ordinary of Newgate, and cross-checked by Linebaugh against other judicial, parish and apprenticeship records The aim, as defined by the author in the 'Introduction', is to pursue the suggestion made in Thompson's *Making of the English Working Class* (1963) to follow the early history of labour 'into the annals of crime", investigating how in 18th century London the 'class war may have been fought out in terms of Tyburn the hulks and the Bridewells on the one hand, and crime riot and mob action on the other' (quoted in Linebaugh, p xvii) This then is not any narrowly-bounded social history of crime, but, as Linebaugh explains in his reply to Keith Thomas a 'book – about class Against the light of accumulated property is the dark figure of crime I write about the development of a relationship the class struggle and the wage"[10] The same point is made with true epigrammatical brilliance in the opening paragraph of *The London Hanged* where Linebaugh draws our attention to the obvious but seldom-noticed double meaning of capital' signifying both crimes punishable by death and the accumulation of wealth founded on the produce of previous (or dead) labour – this book explores the relationship between the organised death of living labour (capital punishment) and the oppression of the living by dead labour (the punishment of capital) (p xv)

Such remarkale widening of horizons becomes sustainable only if the sharp disjunction – of Victorian middle-class provenance but one that infiltrated Marxist language through the term lumpen-proletariat and lingers on at times even in some of Rude's work – between a 'criminal' subculture and the 'respectable' poor is abandoned as unhelpful for 18th century contexts[11] Statistical analysis of *The London Hanged* by occupation and parish origin alike, reveal little marked distinction from the overall profile of the London labouring poor,[12] and a similar conclusion emerges from the multitude of biographies extracted by Linebaugh from 237 issues of the Newgate *Ordinary's Account*. Relevant here – and crucial, we shall see, to the principal thrust of Linebaugh's argument – are the processes of criminalisation and vast extensions of capital crimes so central to English history during the century after the Restoration The bulk of the capital statutes, significantly, were oriented towards the defence of private property and a single legislation the Waltham Black Act of 1723 analysed in Thompson's *Whigs and Hunters*, created in theory 200 new offences that could be punished by death Of the 32 adjudged guilty at the Old Bailey session of January 1715, 29 had been charged with crimes against property mostly of objects of small value, rather than money – and in the early 18th century you could be whipped for stealing goods worth less than a shilling, burnt in hand for values between a shilling and five shillings and transported or hanged for higher valuations What was being criminalised, Linebaugh argues, is an enormous range of customary perquisites and appropriations of producers, at a time about which in the words of a historian not known for any particular radicalism 'historians have not been able to explain how the poor lived [13]

The London Hanged however, does seek to give a merely humanitarian account of the sufferings of the poor or the excesses of an oppressive legal system and its biographical sketches of the Tyburn han are presented in a deliberately unsentimental, often dead pan style Linebaugh is interested first in what he calls 'excarceration' resistance through seeking to run away escape justice the heartfelt longing for freedom the detestation of confinement, silent observation of gates locks and walls (p 12) which he finds to have been a experience common to those incarcerated in workhouses, manufactories and prisons This is counter-posed 'to a recent historiographical trend exemplified by Michel Foucault who stresses incarceration in the great confinement' and who makes the rulers of government and society seem all powerful (p 4) The book thereof begins with Jack Sheppard house breaker and gaol breaker whose repeated ingenious and daring escapes from confinement in the 1720s became a legend that survived in popular pantomime ballads songs plays, and vase paintings so much so that an official commission quoted by Engels' study of Manchester labour conditions in 1844 found his name better known among child labourers than Victoria, Wellington Nelson and Napoleon The 'growing propensity skill and su

of London working people in escaping from the newly created institutions – designed to discipline people", Linebaugh provocatively suggests, was one principal way through which the 17th century revolutionary traditions of liberty and the free born Englishman" were transmitted and developed, as 'the activity of freedom in contrast to its ideological or theoretical expressions "

But plebeian resistance is the least original of Linebaugh's new stresses It had been central to the many 'histories from below of the 1960s and 1970s as well as to Subaltern Studies in India in its early phase By itself, this would have been no more than a recuperation, necessitated by subsequent historiographical developments but otherwise not all that remarkable Far more striking is the international dimension that Linebaugh has opened up, in which crime and punishment in London becomes the entry-point for a study of the Atlantic economy 'from below – and here he goes decisively beyond his teacher, E P Thompson We are introduced first (Chapter Four) to the deep-sea world of ships and sailors, that linked up "the handicrafts of India to the plantation in America to manufactures and putting-out in London Labour aboard the ship "combined the necessities of large scale co-operation such as was found on the plantation with the intricacies of the division of labour such as was found in manufacture and the versatility of individual skills such as might be found in handicraft' (p 66) Above all, "the ship was not only the means of communication between continents it was the first place where working people from the continents communicated (p 134) Linebaugh goes on to note that a by product of the centrality of the slave trade to the 18th century Atlantic economy was the growth of a substantial population of slave and ex slave Afro-Americans in its metropolis London, consisting of drummers horn-players, fiddlers prostitutes cooks boxers and writers (p 355) Of the six men tried for leading roles in the successful attack on Newgate prison during the Gordon Riots of 1780, two were Afro American ex slaves (pp 348-56) Throughout Linebaugh tries to highlight the scattered evidence of solidarities of common oppression and class across racial divides Out of the necessities of communication aboard ship developed creole and pidgin, going into the formation of "an 'oppositional culture that expressed its own motive of justice Crucial for Linebaugh's argument here are the two London-based pioneer Afro American writers and activists, Ottobah Cugoano, who combined calls for the abolition of trade with a kind of proto-pan-Africanism, and Olaudah Equiano, active in the early 1790s helping the radical English artisan Thomas Hardy organise the London Corresponding Society [14]

Linebaugh at one point suggests that by the 1790s the coloured population of London was ' posing a significant political challenge to the ruling class, whose ideology consequently needed to be reformed" (p 355) Though an element of exaggeration may be suspected here, there are still traces in this part of Linebaugh's book of what could have been developed into an alternative way of looking at western racism which, notably through the major impact of Said's *Orientalism*, has tended to acquire the characteristics of a transhistorical constant totally detached from class and production relations Linebaugh s comment seems to suggest that the popular – quite often working-class – racism of the 19th century may have been in part an ideology which developed as a counter to incipient alternative solidarities across racial divides The point has a potential relevance that goes beyond the purely historical or academic for globalisation today is creating a much more internationalised labour-force in the metropolitan countries amidst conditions of growing white racism that is often sought to be countered purely through forging ethnic or religious solidarities of specific immigrant groups Linebaugh s then, is an interesting hint unfortunately it remains no more than that Said is not referred to anywhere in *The London Hanged*, and Linebaugh appears unaware of the current vogue in third world history-writing and cultural studies for colonial discourse analysis abstracted from class

Linebaugh s handling of Foucault however is fully self conscious, and what he has achieved is masterly dialectical transcendence His is far from being a simple rejection, for Foucault s central theme of growing disciplinary authority and interest in the micro physics of power is very much also Linebaugh's concern with the very major difference that *The London Hanged* has been able to bring out brilliantly the connections between many of the changes noted by Foucault and specific processes of labour, profit, and class struggle Thus Linebaugh applauds Foucault's insight (notably in his *Discipline and Punish*) that the legal and penal reforms at the end of the 18th century represented not a new sensibility but another policy towards the tolerated illegalities of the Ancien Regime' Yet his phrase tolerated illegalities' prejudges a relationship in which e aggressively attacked, and in the end successfully expropriated, rights and usages that employees had customarily practised' (p 404)

The basic contribution of *The London Hanged* is to extend to trade, urban crafts and manufacture the theme of whittling down of customary rights and perquisites of toilers through the development of absolute property rights, which Thompson, notably had opened up for the English countryside through *Whigs and Hunters*, followed by a series of powerful and eloquent essays [15] Long distance trade without uniform standards of measurement or containerisation and the dispersed location of units of production in handicrafts putting out and heterogeneous manufacture could lead to confusion as to the ownership of the means, materials and products of production (p 65) leaving wide spaces and times not fully and directly under entrepreneurial supervision This enabled the persistence of what from one point of view would increasingly be considered pilferage embezzlement and inefficiency but from another were defended as perquisites both customary and needed for sheer survival under conditions of very low wages (Moral judgments at this point incidentally have to take due cognisance of the well-established fact that the biggest thieves and swindlers of 18th century England came from the most exalted circles one need only recall the South Sea Bubble and prime minister Walpole himself) [16] Linebaugh s framework is able to relate the progressive criminalisation of customary appropriations of the poor through tightening up of laws of private property penal codes and police bureaucratic authority with rational technological innovations and the transition to factory production for both processes were intimately bound up with changing forms of capitalist extraction of surplus The end results in other words were the modern state and the factory, the latter defined, strikingly, as 'a place where the principles of production and punishment can be united ' (p 285)

What makes Linebaugh so important it needs to be emphasised is not any reiteration of an abstract or generalised 'base-superstructure formula, but a brilliantly-original series of detailed histories bringing out specific interconnections in wholesale ge of 18th century trading operations and production processes He begins with the international trade in tobacco so central to the pre-cotton Atlantic economy, linking-up slave traders in Africa with Virginia

plantations and London shipping, docks and consumers (Chapter V). 'Socking' – London's plebeian slang for pilferage and illicit trade in tobacco – was customary, widespread, and impossible to stop as long as tobacco was shipped and unloaded in unenclosed bundles From the 1690s onwards, repeated efforts were made to safeguard and enhance profits through standardised and secure containers ('hogsheads'), and two meanings of 'customs' came into direct conflict with each other customary practices of sailors, dock-hands and porters which were being criminalised, and the official Customs bureaucracy, which soon revealed itself to be corrupt on a vastly enhanced scale The interconnections unravelled by Linebaugh in this chapter ran right across 18th century society Walpole's effort in 1733 to safeguard the profits of tobacco planters and the revenues of the state by replacing customs duties by excise almost brought down his government, and so a chapter which begins with the hitherto unknown figure of James White, a London porter transported for stealing tobacco and eventually hanged, can end with a new look at a well known political crisis

"Bejewelled by the watchmaker, grounded by the shoemaker, elevated by the hatter, the 18th century personage was 'made' by the tailor' and had his/her needs cared for by a growing army of domestic servants (p 241) The theme of curbing of customary perquisites through tightening up of notions and legal definitions of private property is worked out in illuminating detail by Linebaugh for these "five trades" (Chapter VII) The argument attains its climax in the chapters devoted to silk and ship-building (IX-XI) Silk, concentrated in the East London region of Spitalfields where so many immigrants have settled through the centuries, Linebaugh reminds us, was for the 18th century 'the fabric of power and class command" the language, simultaneously, of 'haughty command', and "a labour of cringing subservience" (pp 257, 9-10) The analysis of criminalisation of customs gets linked up here with a transition from putting-out towards the factory Spitalfields silk-weavers had survived through customary appropriation of wasted raw materials, recycled through plebeian 'rag fairs' They were also exceptionally militant – "heirs to a history of heresy that included the Lollards, the Anabaptists, the Familists, as well as the egalitarian and millenarian sects that had burst forth during the English Revolution" (p 11) – and their resistance during the 1760s won for them, briefly, certain collective bargaining rights. The employers hit back through numerous parliamentary enactments reducing and tightening controls on "the interval between putting out materials and their return" (p 268), and then, far more decisively, by shifting textile centres to the Midlands and the North, moving from silk to cotton – and introducing the spinning jenny, for which Arkwright took out a patent in 1769 " the divisions of labour", Linebaugh argues, had earlier "been reconnected by activities in the street into an open system of assembly Afterwards assembly became increasingly closed behind factory walls Where once the little producer and the poor consumer met in Rag Fair in a thick economy of their own 'underworld', later they would find that the wastes that had sustained them were becoming distinct branches of a capitalist trade in by-products" (p 286)

Chapter XI goes still further, for here Linebaugh takes on directly Bentham – and Foucault's – central metaphor of the Panopticon "the simple idea in architecture' which Bentham had claimed would provide 'a new mode of obtaining power of mind over mind, in a quantity hitherto without example – of punishing the incorrigible, guarding the insane reforming the vicious, confining the suspected, employing the idle, curing the sick, instructing the willing" [17] Using Bentham's correspondence, Linebaugh is able to establish the striking fact that the idea had actually originated with Jeremy Bentham s brother Samuel, in the specific context of the latter's abortive efforts to instill discipline and efficiency in the naval dockyard being built by Catherine the Great's favourite Potemkin on the Black Sea Returning to England, Samuel busied himself constructing models of the Panopticon, while Jeremy drafted revisions of the plan and wrote letters advancing the idea to influential people" (p 373)

The fully elaborated model of centrality of control, apparent omnipresence of inspection as guaranteed by the invisibility of the ispector (he can see all but none can see him), and total isolation of those confined, has always remained, perhaps, a little beyond reach though 20th century concentration camp authorities have tried their best But the Bentham brothers did get a chance of implementing some of their ideas through Samuel's appointment as inspector-general of Naval Works in 1795 at a critical moment in Britain's war against Revolutionary France, and at a site where capitalist innovation and the vital interest of the English are intertwined in inseparable ways. 18th century naval dockyards on the had balanced a regime of very low irregular money-wages by tolerance practice of 'chips' customary appropri of wood scraps and waste created during as yet physically discrete work of hew chopping, and sawing ship timbers The naval disasters of the American war led to repeated efforts to reduce what the authorities now felt were intolerable levels of waste and inefficiency Samuel Bentham played a crucial role in this process, in particular through innovations like the floating dam which enabled the dock to receive fully loaded ships (thus locating unloadi operations within a controllable space), planning a gradual transition from timber iron The central thrust, Linebau emphasises was in every case di towards 'crushing the power of shi workers" through establishing effect supervision and control over the details the labour-process, and for this he w to replace the ship workers' apprenticeship system by Naval Seminaries "that would divide knowledge according to class: the common workman and the 'superior officers' would attend different branches (p 399) Like Frederick Taylor a century later what Samuel Bentham wanted was "to take all the important decisions and planning out of the hands of the workmen', endi a situation in which the technical organisation of production was not sep from the forms of workers self organisation" through evolving systems of management that would "complete the despotism of capital in the process of production" (p 400)

The curbing of the autonomy of the pro industrial workforce through disciplinary and technological innovations was evidently bound up with specific kinds and uses 'reason through which science command became allies, and "cl despotism was grounded less on f than on rationality' " (p 400) Linebau takes up this theme again in his concludi chapter, 'Sugar and Police the Working-Class in the 1790s, which is the taming of the London waterfront throu enclosed docks and the foundation of Marine Police Office in 1798 the very fi centrally-directed and paid London poli force The key figure here was Patri Colquhoun Scottish textile manufacture agent of British sugar plantation owners i the West Indies, principal organiser of 1798 river police, client of Home Secret Henry Dundas and friend of Ed Burke, Edward Gibbon, and Adam S He was also the author of numerous

which pointed out that the "progressive increases of crimes" is "the constant and never-failing attendant on the accumulation of wealth" and so the organisation of the police "as a new Science" was vital 'for the well-ordering and comfort of civil society" (p 427)

As with the Foucaultian theme of surveillance, though in less elaborated or explicit ways, Linebaugh is engaged in such passages in modifying and appropriating into a renovated Marxian framework elements of the critique of Enlightenment rationalism which has become so ubiquitous in recent times Integrated into the study of changing labour processes and class conflict, that critique itself becomes much more discriminating and precise Enlightenment ceases to remain a homogenised, abstract label, nor is its counter-point sought in any undifferentiated, pre modern 'tradition' What men like Samuel Bentham or Patrick Colquhoun were trying to destroy were quite specific artisan skills and expertise, 'rational' in their own way, while simultaneously establishing monopoly controls over the new forms of knowledge in the interests of capitalist property Linebaugh's approach here comes close to the notions of artisanal 'counter-enlightenment which E P Thompson had touched upon in his posthumously published study of William Blake [18]

Linebaugh's last chapter is marked by a note of pessimism which seems a bit out of tune with the rest of the book If the escapes of Jack Sheppard had epitomised the vigorous independence of the 'picaresque proletariat' of the 18th century, the transition to the industrial working class governed by the money-wage is symbolised for him by the Punch and Judy pantomime, which became popular from the 1790s, during the industrial revolution Punch is able to hang the hangman, as the London crowd in 1780 had destroyed Newgate prison but otherwise Punch is shown busy beating up everyone, friend and foe alike Discipline was becoming internalised, the new wage-labourers were starting to do the hangman's job for him for the imposition of wages erected hierarchised distinctions between the respectable and the criminal poor, regularly-employed, casual, and unemployed, men and women, free and slave (p 441)

But then . was Foucault right after all, and not just for industrial society, but maybe earlier, too? For if we are to judge by consequences, surely the picaresque proletariat had also failed, and their escapes, riots and violations of property rights had achieved nothing substantial, had indeed furthered in a way the capitalist production-processes, property laws, and state power And if wage-labour created divisions, the plebeian survival through 'crime' of the 18th century must have often been at the cost of those only a little better-off than they themselves as Linebaugh himself recognises in his analysis of the Old Bailey jury There is, further, the question of gender divides and oppression within plebeian communities, which Linebaugh discusses only briefly at the end of his chapter on the sailors as a picaresque proletariat, and does not handle in ways that can be considered adequate [19]

I do not think such unmitigated pessimism is called for by the overall tenor of Linebaugh's data and analysis In his closing chapter, Linebaugh, for once, seems somewhat undialectical, leaving no space for the possibilities that were also opened up by the transition to factory labour So much of the real history of the development of democratic institutions and social welfare structures in developed capitalist societies is bound up, after all, with the pressures and struggles of organised labour Conversely, now that the concentration of workers in huge factories that had provided the bedrock for the labour movement from the 19th century seems to be in decline, the opening up by Linebaugh of the possibilities of resistance in more heterogeneous conditions acquires considerable contemporary relevance Capitalism, it is true, has not yet produced its definitive grave-digger what it has never failed to provoke into existence and struggle, throughout its long and ever changing history, are what Thompson once called 'armies of redressers'

Foreign Direct Investment
A Solution to BOP Problems?

Pronab Sen

This paper addresses the central problematic: Do FDI inflows improve the short-run balance of payments or do they require additional foreign exchange funding in the form of foreign borrowings or through depletion of foreign exchange reserves? The answer to this question is crucial not only for formulating a policy structure for foreign investments but also in determining the position that developing country governments should take with regard to pressures for liberalising controls on foreign equity.

I
Introduction

IN the aftermath of the 'debt crisis' of the early 1980s, the view that 'foreign direct investments' (FDI) have a more salutary effect on the balance of payments (BOP) of developing countries than debt finance has become widespread. This is quite apart from the other benefits of FDI, such as greater productivity, better quality, lower costs, etc, which are taken to be axiomatic. The obvious outcome of such a perception has been a sustained pressure by the multilateral aid agencies and OECD governments on developing countries to actively encourage FDI as an integral part of their BOP management strategy.

In recent years, however, the lustre has worn somewhat thin on this prescription, principally due to emerging empirical evidence which suggest that FDI may have a more positive impact on the BOP of the originating country than on that of the recipient country.[1] As a consequence, even the World Bank has muted its otherwise enthusiastic advocacy of FDI by conceding that "...the empirical observation that profits on FDI often climb quite steeply after an initial period of unprofitability ...suggests that FDI should not generally be viewed as a means of financing balance-of-payments needs over the medium term".[2] Theoretically of course this is nothing new,[3] but the evidence had finally become too compelling to ignore.

Despite the more pessimistic view of the medium-term effects of FDI that has come about recently, it continues to be heavily touted as a solution to short-term BOP management problems. Interestingly, this assertion has really not been subjected to rigorous and critical scrutiny either empirically or theoretically within a macro-economic framework – which is the appropriate domain of analysis. There is of course an enormous body of literature on the micro-economic dimensions of FDI, particularly on the behaviour of trans- or multi-national corporations, but this is of limited relevance to analysing the BOP implications. In its modest way this paper seeks to fill a part of this lacuna by examining the short run BOP repercussions of FDI within the framework of a simple pedagogic macro-economic model.

Before entering into the analytics, however, a few definitions need to be established. Total foreign investments, as an item in the capital account, can conceptually be divided into two components: (a) foreign direct investments (FDI); and (b) foreign portfolio investments (FPI). The definitions of these two forms of investment are not the same to all people, and hence a semantic problem may arise unless these are clarified at the very outset. Three definitions are in fairly wide currency today. These are:

(a) FPI is the acquisition of domestic non-equity instruments; whereas FDI involves equity participation, whether in new or existing companies.

(b) FPI involves the acquisition of existing financial assets, whether debt or equity; whereas FDI leads to an expansion of the equity base either in a new or an existing company.

(c) FPI involves the acquisition of claims on existing real assets, whether in the form of debt or equity; whereas FDI leads to the creation of new real assets through equity participation.

The first definition, although attractive from the point of view of financial management and corporate law, is much too imprecise in its economic content for the kind of analysis being contemplated in this paper.[4] As far as the other two definitions are concerned, it should be clear on reflection that they differ only with respect to one specific form of foreign investment – namely, the inflow of foreign equity capital for augmenting the equity base of an existing company which is used to retire existing debt. Such investments would be treated as FDI under definition (b), but as FPI under definition (c).[5]

Although the two definitions differ only on this one count, the difference is significant. Definition (c) is more precise in that the distinction between the two forms of foreign investments is couched in terms of whether or not the capital inflow directly leads to an expansion of the real productive capacity of the country. Under definition (b) a grey area remains, which can cause some analytic problems. Moreover, the third definition is also closer to the common or popular understanding of FDI, which is always a desirable characteristic of any definition. In this paper, therefore, the term FDI shall be used in the specific sense that it represents an equity investment which is directly related to the creation of new real capacity.

In dealing with the BOP effects of FDI, care needs to be taken in defining the time dimensionality of the analysis. This paper, as mentioned earlier, is concerned primarily with the role of FDI in short-run BOP management. The 'short-run', in this usage, refers to the period in which the economy's productive capacity and structure are assumed to remain constant. Thus a convenient cut-off point for the analysis is the time at which the company or project embodying the FDI comes into production. Prior to this point in time, the BOP effects of the FDI are limited to the foreign exchange inflow arising out of the capital transfer and that outflow the occurs as a direct consequence through the current account. Subsequently, however, a number of other considerations become much more important – such as export earnings from the FDI, import intensity of the project, reinvestment and repatriation of profits, etc.

While these latter effects are certainly important in assessing the worth of FDI to the national economy, and therefore to the issue of whether FDI should be encouraged or not, they are incidental to the central problematic that is being addressed here: 'Do FDI inflows improve the short-run balance of payments, or do they require additional foreign exchange funding in the form of foreign borrowings or through depletion of the foreign exchange reserves?' The answer to this question is crucial not only for formulating a policy structure for foreign investments but also in determining

the position that developing country governments should take with regard to pressures for liberalising controls on foreign equity

II
Analytical Framework

Consider a small open economy which produces two goods (a) an export product which is not consumed domestically and (b) a composite home good which is used for both consumption and investment In addition, it also imports a consumption good and, if necessary capital goods from abroad The country is assumed to pursue a free trade policy with a fixed exchange rate [6] It does not however have an open capital account, in the sense that foreign financial capital cannot flow in freely but requires government clearance on a case by case basis, and that domestic capital cannot flow out at all

It is further assumed that there is unemployment in the economy so that domestic factors are available at fixed nominal prices The production of the home good is assumed to be unconstrained by capacity so that its supply exhibits constant returns to scale in the neighbourhood of the initial equilibrium Its output is therefore determined by the aggregate demand facing it The export good on the other hand is assumed to be capacity constrained in the sense that internal diseconomies of scale have set in thus giving rise to an upward sloping supply curve even with constant factor prices

With these assumptions the formal model may now be specified Consider first the export Under the samll country assumption and with fixed exchange rates the demand curve facing the industry is infinitely elastic at a particular domestic currency price Its output is therefore determined entirely by its production conditions With constant input prices, this implies that the volume of exports and the export earnings are fixed *ex ante* Thus, using appropriate normalisation the total export earnings in terms of the home good may be specified as

$$X = \bar{X} \qquad (1)$$

As far as investments are concerned the 'closed capital account assumption frees the domestic investment demand from international influences As a result the animal spirits" of the domestic entrepreneurs can find free play in determining the level of investments In a typically Keynesian manner, this may be written as [7]

$$I = \bar{I} \qquad (2)$$

As is usual in such models, aggregate consumption demand is assumed to depend only on the level of real income Since terms of trade changes and international transfers have been assumed away real income is identical to the real output (GDP). Thus the aggregate consumption function specified in terms of the home good is

$$C = C(Y) \quad C' > 0 \text{ and } C'' < 0 \qquad (3)$$

where C – aggregate consumption demand Y – real GDP

Normally the imported component of consumption would be determined by aggregate consumption dermand and the relative prices of the import and the home good Under the assumptions of constant production cost of the home good constant price of the import and a fixed exchange rate the relative price between the two goods can also be treated as fixed Therefore the demand functions for the import with appropriate choice of units and the home good can be specified as [8]

$$M = F(C) = M(Y) \quad M > 0 \qquad (4)$$
$$D = C - M = D(Y) \quad D > 0 \qquad (5)$$

As can be seen the model conforms to the most elementary 'extbook version of an open economy Keynesian macro economic system Proceeding in the usual manner the national income accounting identities are

$$Y = C + I + X - M \qquad (6)$$
$$Y = C + S \qquad (7)$$

From (6) and (7) the trade balance of the economy can be written as

$$T = (X - M) = (S - I) \qquad (8)$$

Equations (6) and (8) are the two basic equations that will be used in this paper These may be respecified by adding the structure from the other equations as

$$Y = C(Y) + \bar{I} + \bar{X} - M(Y) \qquad (9)$$
$$T = \bar{X} - M(Y) \qquad (10)$$

From (9) and (10) the effects of an exogenous change in I on the trade balance (T) can be derived as

$$\frac{dT}{dI} = \frac{\partial T}{\partial Y}\frac{dY}{dI} = -M \qquad (11)$$
$$\frac{}{} \qquad\qquad S + M$$

where M = marginal propensity to import
S = (1 – C') = marginal propensity to save

Having done the ground work, the effect of FDI on the economy can now be considered Assume an initial equilibrium where the savings and investments are such that the trade balance is zero [9] Suppose now a new investment is planned by a foreign investor of a domestic currency value Z Of this, a fraction d' is for the purchase of the home-good and (1 – d) is to be imported Of the total project value let 'f' represent the percentage which is brought in equity by the foreign investor in the form of foreign exchange Thus (f Z) represents the additional inflow in the capital account whereas [(1 – d) Z] is the corresponding payment for imports appearing in the current account [10] Therefore the net foreign exchange inflow directly on account of the FDI is

$$[f - (1 - d)]Z$$

Notice however, that the amount 'd Z enters the market for the home good as an additional item of investment demand, which means

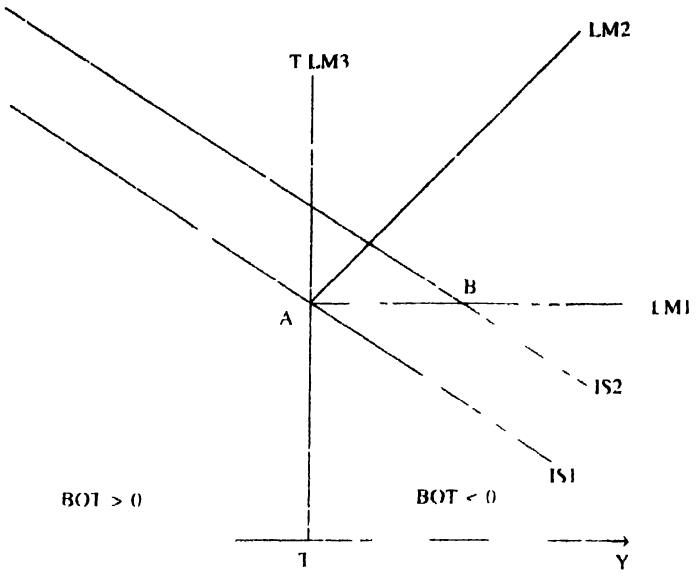
$$\Delta I = d\,Z$$

Therefore from equation (11) the effects of this increased investment dem ind on the trade balance may be specified as

$$\Delta T = \frac{-\,d\,M}{S + M} - Z$$

The total balance of payments effect of the new investment is given by the difference between the inflow in the capital account and the total outflow in the current account

$$\Delta B = \left[f - (1 - d)\frac{d\,M}{S + M} - 1\right] Z \qquad (12)$$



It is quite obvious from equation (12) that unless the capital inflow is actually substantially higher than the value of tied imports (i e f > 1 – d), the BOP must necessarily worsen in the short run as a result of the FDI In order to appreciate the magnitudes involved consider the relevant parameters for India which are (a) M = 0 15, and (b) S = 0 27 Substituting into equation (12) yields

$$\Delta B = [f + 0\,64d - 1]Z \qquad (13)$$

As can be seen even if the project involves no import of real capital (i e d = 1) the equity inflow must exceed 36 per cent of the total project cost for it have a neutral effect on the BOP In other words any FDI which involves a debt equity ratio of above 1 8 1 will always make the BOP worse [11] This maximum debt equity ratio will decrease sharply as either the direct import increases or foreign equity share drops or both

This is such an obvious result that it cries out for an explanation of any contrary position One equally obvious explanation is that the condition for a positive BOP effect is almost always satisfied, that is FDIs normally have a significantly higher capital account entry associated with them than the corresponding current account entry This is clearly an empirical issue, but the weight of common perception, for what it is worth, is firmly against it Moreover, some scattered evidence for India strongly suggests that the foreign exchange component of FDIs does not

FIGURE 1

ed the stated value of the real capital
nted for the project [1]

ic other possible explanation is that the
le minded model used above does not
ire some important institutional and
vioural factors which if taken into
unt would reverse the prognosis There
of course a number of lacunae in the
el but the most significant of these for
urposes of analysing BOP effects is the
ice of the monetary or financial sectors
h has been the basis of the criticism of
sic Keynesian system by the monetarist
ter revolution

III
Credit Market Complications

the model described in the previous
on the crucial assumption that drives
sult is that the additional demand for
domestic investible resources arising out of the FDI is reflected only in the commodities market, but not in the credit market Indeed the credit market is altogether ignored It should be apparent, however that if the domestic currency value of the foreign liquid capital is less than the value of the project, as has been assumed then financial resources must necessarily be raised in the domestic capital market This would presumably have some repercussions over and above those already taken into account

The Keynesian justification for ignoring these repercussions is that the the economy is caught in a 'liquidity trap' whereby any increase in demand for financial resources is met through corresponding increases in the availability of credit and not through interest rate adjustments [13] Thus, in terms of the familiar IS-LM framework, the LM curve is assumed to be infinitely elastic at a given interest rate over the relevant range

The monetarist counter revolution selected the 'liquidity trap' as the central weakness of the Keynesian analysis It was pointed out that the credit market, like any other market cannot be presumed to follow a pure quantity adjustment mechanism at all times but should have at least some price adjustments as well Thus an excess demand for loanable funds should give rise to an increase in the interest rate If investments are interest rate sensitive to any extent and this is pointed out as another extreme assumption in the Keynesian framework then the new investment demand will force out some existing planned investments Thus the net increase in the level of investment demand will be less than the value of the new investment This phenomenon is referred to as 'crowding out' [14] At the limit when there is pure price adjustment in the credit market there would be complete 'crowding out' in the sense that the real value of the investments driven out would exactly equal the value of the new investment [15] Within the IS-LM framework these possibilities are reflected in the slope of the LM curve, which would not be horizontal as assumed earlier but upward sloping and at the limit may even be vertical

For the purpose of this paper it is not necessary to explicitly specify the LM curve, but only to retain awareness of its character and its determinants In the rest of this paper it is assumed that the reader is familiar with the basics of the IS-LM model In order to recast the model in the IS-LM mould some changes have to be incorporated in the earlier equations Consider first the IS curve in this case It is simply equation (9), respecified to make investment demand sensitive to the interest rate (r)

$$Y = C(Y) + I(r, \theta) + \bar{X} - M(Y) \qquad (14)$$

where θ = a shift variable representing the FDI project thus, $dI/d\theta = d\,Z > 0$
$dI/dr < 0$

It is easy to verify that this IS curve is downward sloping in the (Y r) plane

The trade balance effect in this framework can be represented by another curve (call it the TT curve), which is the locus of all (Y r) combinations at which the trade balance is zero This is derived by evaluating equation (10 at T = 0, yielding

$$\bar{X} \quad M(Y) = 0 \qquad (15)$$

Clearly equation (15) defines a vertical line originating from the Y-axis in the (Y, r) plane All points to the left of this line are associated with positive balance of trade, and those to the right with negative BOT

In analysing the effects of FDI in this framework the focus is on the secondary BOT effects which arise from the increase in investment demand for the home-good (d Z) The objective is to examine whether or not the FDI needs to have a capital account entry (f Z) greater than the value of the direct imports for the project [(1 – d) Z] in order to prevent a deterioration in the short-run BOP The situation is depicted in Figure 1 The initial position is shown at point A where the goods market (represented by IS1) the money or credit market (represented by LM1 LM2 or LM3 each representing different assumptions regarding the adjustment mechanism) and the trade balance (shown by TT) are all at equilibrium [16]

The effect of the FDI is to shift the IS curve to IS2 the horizontal shift being [(d M Z)/(M + S)] The trade balance effect is given by the horizontal distance between the TT curve and the new internal equilibrium (the intersection of the IS and LM curves) Note that LM1 represents the earlier "liquidity trap scenario It is obvious that with the LM curve being upward sloping, the trade balance effect will be less negative than derived before (AB in the diagram) The important point, however is that the effect continues to be negative except with complete 'crowding out' (LM3) where it is exactly zero There is no possibility of a BOT improvement, unless the LM curve is downward sloping – which would make the system unstable

It should be clear then that pure crowding out does not provide an adequate justification for believing in a positive BOP effect of FDI Something more is needed In the recent literature this 'something more' is the sensitivity of savings, and hence of consumption demand to changes in the interest rate [17] Introducing this assumption into the model changes its character quite

substantially Returning to equation (3), it has to be respecified as follows

$$C = C(Y, r) \quad C1 > 0 \text{ and } C2 < 0 \quad (16)$$

As a direct consequence equation (4) changes to

$$M = M(Y, r) \quad M1 > 0 \text{ and } M2 < 0 \quad (17)$$

Thus the IS curve now becomes

$$Y = C(Y, r) + I(r, \theta) + \lambda \quad M(Y, r) \quad (18)$$

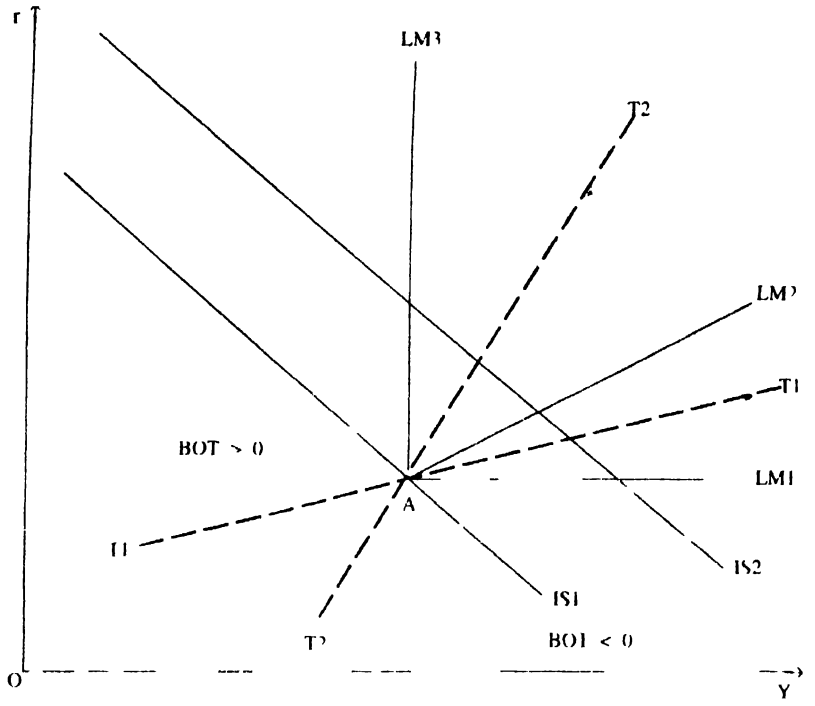
and the TT curve

$$\bar{X} - M(Y, r) = 0 \quad (19)$$

It can be easily verified that the following slopes hold

$$\left.\frac{dY}{dr}\right|_{IS} < 0 \text{ and } \left.\frac{dY}{dr}\right|_{TT} \geq 0$$

The effect of FDI in this case is shown in Figure 2 The first result that is apparent from the diagram is that if M2 is strictly negative i e the TT curve is not vertical then complete crowding out is sufficient to ensure a positive BOT effect of the FDI This is intuitively obvious in that a rise in the interest rate in this case not only crowds out investment it crowds out some consumption as well Therefore if complete crowding out gave rise to a zero BOT effect earlier it must necessarily yield a positive BOT effect here By the same logic if consumption is sufficiently interest rate sensitive then complete crowding out is not necessary for a positive BOT effect This possibility is shown by the T1 T1 curve *vis a vis* the LM2 curve



A much more important point that emerges however, is that the positive BOT effect of FDI is contingent upon a particular relationship between the LM and TT curves This may be seen from Figure 2 by noting that if the liquidity trap holds (i e LM1 is the relevant representation of the credit market) then the BOT will always worsen regardless of the position of the TT curve More generally if the behavioural parameters are such that the TT curve intersects the LM curve from below (which is depicted by the T2T2 curve relative to LM2) then the BOT effects of FDI are always negative It is clear therefore that for a FDI to have a positive BOT effect the following relationship must hold

$$\left.\frac{dY}{dr}\right|_{LM} < \left.\frac{dY}{dr}\right|_{TT} \quad (20)$$

For condition (20) to hold it is necessary that the demand for loanable funds be less sensitive to interest rate changes than the demand for imports The intuitive explanation of this requirement is that unless 'crowding out involves substantial rise in the interest rate the expansionary income effect of increased investment demand will dominate the contractionary interest rate effect on the demand for imports

Thus the basic message of the analysis presented in this section is that the belief that

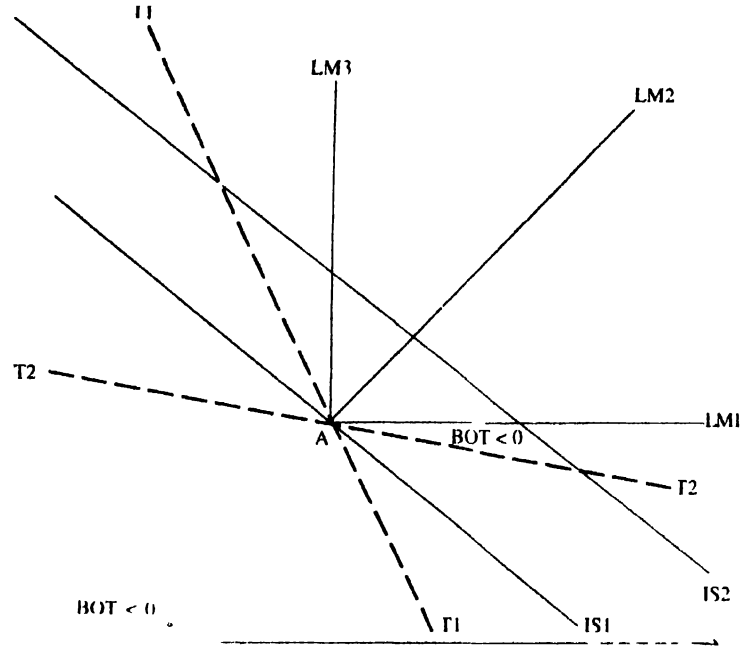
FIGURE 2

FDI improves the short run BOP position requires its proponents to not only have a specific set of behavioural relations in mind but that they must also hold some a priori views on the values taken by a few key parameters The latter is of course an empirical matter and requires rigorous estimation but the former may be subjected to critical evaluation on the basis of existing empirical and theoretical literature

IV
Realism of Behavioural Assumptions

In the preceding section it has been shown that for a FDI to have a positive BOP effect two conditions must obtain (a) There must be crowding out of investments and (b) Imports should be negatively related to the interest rate

Therefore the argument centres around the effect of the FDI on the domestic interest rate and its repercussion on the other macro variables Granting that the economy is not in a liquidity trap so that the FDI will tend to raise the interest rate the issue is whether the effects of this interest rate change on the micro-economy that have been assumed are both correct and complete It is not at all clear that they are particularly in the context of developing countries



Consider first the role of interest rates Thus far it has been assumed that the only function performed by the interest rate is in determining inter temporal allocations via savings and investments [18] This may be acceptable in the case of standard closed economy models where relative prices are assumed to have virtually no role to play It may also be acceptable in the case of countries which employ relatively capital intensive production technologies since the dominant form of capital would be fixed capital whose short run return is not necessarily the prevailing interest rate For the average developing country, however interest rates have an additional role to play which cannot readily be ignored they are intrinsic in determining the relative cost of production of domestic goods *vis a vis* foreign prices

The effect of interest rates on domestic costs and prices as has been well established in the literature on price formation in developing countries operates through the cost of working capital which forms a substantial proportion of total capital in labour intensive production processes In particular working capital has a very significant role to play in the cost of exports, where the time duration between production and sales realisation can be fairly long Therefore in a situation where the interest rate is assumed to change endogenously, the export function would have to be appropriately modified to take this factor into account

$$X = X(r), \quad X \leq 0 \quad (21)$$

As far as the import demand function is concerned, the interest rate affects it through two distinct mechanisms The first is through the relative price between the import and the home-good, which declines as the interest rate increases The second is through the sensitivity of savings, and hence consumption, to interest rate changes as embodied in equations (16) and (17) These

FIGURE 3

two influences operate in opposite directions The former tending to increase import demand as the interest rises and the latter tending to reduce it However the latter effect is also open to question in the case of developing countries

The standard arguments in support of including the interest rate in the consumption function arise out of the Permanent Income hypothesis of consumption demand as distinct from the usual Keynesian Absolute Income hypothesis It is widely recognised that in order for the permanent income hypothesis to hold the domestic credit market has to be extremely well-developed, particularly with respect to consumption credit [19] The credit markets in developing countries are rarely so well developed [20] In some countries specific segments of the economy may exhibit permanent income type behaviour, but these usually represent only a small fraction of total consumption demand The empirical literature on consumption functions in India bear out these assertions Most studies have shown that the Indian consumption function is completely insensitive to the interest rate [21] A recent study, however, demonstrates that the permanent income hypothesis does obtain for the urban sector, but not for the rural [22] Therefore the theoretical and empirical underpinnings for inclusion of the interest rate as an argument in the consumption function are very weak in the case of developing countries Thus for these countries equation (3) is probably a better representation of reality than equation (16)

If the interest rate has only a minimal role to play in determining the consumption levels in developing countries, as has been argued above, then it will tend to be dominated by the relative price effect in the import demand function Therefore, although the general form of the import demand function will continue to be the same as in equation (17) the sign of the derivative with respect to the interest rate should be quite different This function may then be specified as

$$M = M(Y, r) \quad M1 > 0 \text{ and } M2 > 0 \quad (22)$$

Finally the Indian empirical evidence also does not lend strong support to the view that investment demand in developing countries is interest rate sensitive [23] The evidence however is mixed Most studies have found no significant relationship between investments and interest rates but a few have noted that there is a significant negative relationship with respect to nominal interest rates, but not with real interest rates On the other hand real output has almost always turned out to be strongly significant, implying the existence of an "accelerator' mechanism Although it is clearly not possible to generalise from the Indian experience, there is a fair likelihood of such behaviour being replicated in other developing countries as well This would argue for a respecification of the investment demand function in the following manner

$$I = I(Y, r, \theta), \; I1 > 0, \; I2 \leq 0, \; I3 > 0 \quad (23)$$

Putting all these observations together a possibly more appropriate version of the model for developing countries emerges This model is characterised by the following IS and TT curves.

$$Y = C(Y) + I(Y, r, \theta) + X(r) - M(Y, r) \quad (24)$$

$$X(r) - M(Y, r) = 0 \quad (25)$$

It is easy to verify that under reasonable assumptions the slopes of these curves are [24]

$$\left(\frac{dY}{dr}\right)_{IS} < 0 \text{ and } \left(\frac{dY}{dr}\right)_{TT} < 0$$

The impact of FDI in this model is shown in Figure 3 The single most important result that emerges is that if the TT curve is downward sloping in the (Y r) space, then a FDI will always lead to a deterioration of the trade balance regardless of the position and shape of the LM curve The only issue left open to question is whether or not the 'crowding out" effect helps matters at all

As can be seen from the diagram, the answer clearly depends upon the relative slopes of the TT and IS-curves If the TT curve intersects the IS curve from above (as shown by T1T1) which requires that investment demand be more sensitive to interest rate changes than exports and imports, then the existence of crowding out' does reduce the negative BOT impact If, on the other hand the intersection is from below (as with T2T2) then the rise in the interest rate actually makes the BOT even worse than what it would have been with the liquidity trap in operation Therefore, if domestic investments are insensitive to interest rates as has been argued the FDI-induced rise in the interest rate will inevitably lead to a very substantial worsening of the trade balance [25]

Horns of Dilemma

In the preceding sections it has been shown that FDI will almost always lead to a short-run trade balance deterioration greater than that implied by the direct imports associated with the project particularly in developing countries It should be clear therefore that FDI should not be treated as a short run BOP management device The real benefit of FDI lies in augmenting the level of investments in the economy and thereby contributing to output expansion and growth However given the negative BOP effects, the government has to take collateral steps to ensure that the economy does not run into a serious foreign exchange problem The choices available to the government for effectively countering this prospect are (a) Increase planned foreign borrowings (b) Implement appropriate macro economic adjustments (c) Ensure that the foreign investor remits sufficient foreign exchange as equity to cover not only his direct import, but also the additional imports that arise through the macro economic repercussions

The first is clearly not an option since it merely involves the redesignation of what would have been an ex-post outcome as an *ex-ante* decision.[7] The only condition under which this would not be true is if these additional foreign borrowings are provided at appropriately low interest rates by the concerned international agencies for the specific purpose of meeting such FDI-induced trade gaps.

The second option is the most likely one, but great care needs to be taken in determining what the proper policy response should be. The standard prescription in such situations as any one familiar with the orthodox balance of payments policy literature knows is to impose a contractionary monetary policy. This measure supposedly allows the new investment to be incorporated by driving out less capital-efficient projects without any real loss to current output. In terms of the IS-LM framework this means an upward shift in the LM curve. In the situations depicted in Figures 1 and 2 this supposition holds true and a contractionary monetary policy does prevent a BOP deterioration. But what of the situation prevailing in developing countries as shown in Figure 3?[8]

Clearly, if the parameter values are such that T2T2 obtains then a contractionary monetary policy will lead to an even further worsening of the trade balance position. In such cases the heterodox prescription of an accommodating monetary stance is always to be preferred. On the other hand in cases where T1T1 is the applicable balanced trade locus a contractionary monetary policy will be effective in closing the trade-gap. But there is a cost: current output would have to be driven below its pre-FDI equilibrium level. The presumed long run benefit of FDI would have to be high indeed if it is to outweigh the necessary reduction in both current consumption and domestic investments. Thus a contractionary monetary policy is in general an inappropriate response for such a situation in developing countries.

An alternative response would be for the government to reduce its public investments by the same quantum as the domestic component of the FDI and thereby bring the IS curve back to IS1. As can be seen this device corrects the BOT effect in all cases. There are, however, two drawbacks to this prescription which need to be taken into account. First, in most developing countries the bulk of public investments go into creation of infrastructure and there is very little possibility of private substitutes. There is growing evidence that public infrastructural investments are complementary to private investments and any reduction in the former tends to reduce the latter. Therefore the use of such policies for short run BOP management can lead to serious long run consequences. Second, given the finite level of any government investments, such a device is of necessity only of limited applicability. As the volume of FDI increases this possibility will shrink rapidly.

The third possibility is for the government to depreciate the currency so that the negative effects of the rise in interest rates on domestic production is offset. In terms of the model a depreciation of the currency can be depicted by a rightward shift in the TT curves. Although the IS curves too will move in the same direction the magnitude will be lesser than that of the TT curves. Thus in all cases the possibility exists that the negative BOT effect of FDI can be corrected by this measure without loss of current production and consumption. Of all the possible macro economic adjustments this appears to hold the most promise.

The final option namely, requiring the foreign investor to remit more foreign exchange in the form of equity than is required for his direct imports raises the most interesting issues for further research. In the first place such a requirement may frequently run counter to basic commercial principles. As has been computed in the Indian case (see equation (13)) if a FDI project has say 30 per cent direct imports then the maximum permissible debt equity ratio is 0.8:1 even if 100 per cent foreign equity is allowed. Such a stipulation in all probability will discourage almost all potential foreign investors from investing in the country.

The problem gets further compounded when the desirability of permitting 100 per cent foreign equity is taken into account. On one hand short run considerations demand that the foreign investor brings in as much financial resources as possible. On the other hand longer run considerations require that foreign equity holdings be restricted to the minimum feasible particularly when the expected return to equity is substantially higher than the existing international rate of interest. These considerations underlie much of the policies targeted at FDI control in a number of developing countries. The analysis presented in this paper suggests that this trade off may not be trivial and the inter temporal welfare effects of equity based control of FDI are not at all obvious.

There is of course an obvious way around this problem and that is through permitting selected inflow of FPI to cover the short-run foreign exchange outflow arising from FDI. This option however raises a number of other issues which cannot be handled in the present framework.[9] The limited objective of this paper was to clear up certain misconceptions regarding the effects of FDI and to raise the issues for further work. It is hoped that this preliminary analysis is of sufficient interest to provoke further research into this important but neglected area of open economy macro economics.

Notes

[This paper is dedicated to the memory of N C Ray who taught the author the most valuable lesson that useful insights into economic processes do not necessarily require complex modelling but can in fact be obtained from fairly simple frameworks. The paper reflects the personal views of the author and not those of the organisation to which he belongs.]

1 See Reddaway et al (1967), Hufbauer and Adler (1968), Bergsten et al (1978), Swedenborg (1979), Lipsey and Weiss (1981 and 1984), Blomstrom et al (1988) and Bergsten and Graham (1994).

2 World Bank (1993) pp 29-30.

3 The debate surrounding the transfer problem in the 1920s had as its essence the issue of whether the capital outflow necessitated by the reparation payments by Germany to the Allies would lead to an export surplus in Germany's merchandise trade. The later formalisations of this issue in the Heckscher-Ohlin-Samuelson type of trade theoretic models also suggested similar results. See Meade (1951) and Modigliani and Neisser (1953).

4 The imprecision arises from the lack of a well defined linkage between the financial flow and the real economy. Such imprecision inevitably leads to a very wide taxonomy of results and dilutes the focus of the analysis.

5 It may be noted that in India definition (b) is used by the government in its classification of FDI/FPI. It is for this reason that non capacity creating investments such as foreign companies increasing their equity share in existing subsidiaries and GDR issues by Indian companies are routinely classified as FDI.

6 The free trade assumption has been made for expository convenience since it allows the analysis to proceed without explicitly bringing in the government's fiscal actions. The analysis however carries through so long as trade is restricted by tariffs and not quotas.

7 It may be noted that the import of capital goods by domestic entrepreneurs has been assumed to be zero. Some generality is lost by this assumption but similar results could be obtained by making imported capital goods a fixed percentage of investments.

8 Given that the relative price between the import and the home good is fixed it is possible to specify these demand functions in an even simpler way by making them each a constant fraction of the consumption function. The versions given in the text are used because they conform to common usage and are slightly more general in that homotheticity is not assumed. It should be remembered however that the concavity of the aggregate consumption function $(D + M)$ requires that $(D + M) > 0$ and $(D' + M') < 0$. The second argument for this specification is that the import does not necessarily have to be a final good but can be an intermediate in the production of the home good.

9 This assumption can be made without loss of generality since it accommodates an initial trade deficit with an equivalent quantum of foreign borrowings.

10 The 'real' capital brought in by the foreign investor does not necessarily have to be in the form of plant and machinery, which would appear in the merchandise account but can include such proprietary capital as blue-prints, goodwill etc, which would be captured as 'invisibles'

11 This maximal debt-equity ratio is derived from equation (13) by setting d = 1 and assuming 100 per cent foreign equity holding

12 This data has been collected by M Saqib of the Indian Council for Research on International Economic Relations (ICRIER) for an empirical study of FDI in India

13 The standard explanation of the liquidity trap may be found in any textbook on macro economics The later and more sophisticated explanations may be found in the literature regarding the debates surrounding (a) inside money vs outside money and (b) new view vs old view of banking

14 Crowding out does not really require the interest rate to go up Much the same effect is obtained in the recent literature on rationed credit markets

15 This of course includes the possibility that the new project itself may be crowded out if it is the marginal project If not then the FDI would have the effect of raising the marginal efficiency of domestic capital

16 This model belongs to the class of open economy macro models pioneered by Mundell (1968)

17 For an exposition and references see Dornbusch (1980)

18 This assumption is common to virtually all existing open economy macro models of the Mundellian genre of which the model presented in Section III is also a member

19 See Friedman (1957)

20 Although a fair amount of consumption credit is extended by moneylenders and other informal credit market operators in developing countries it is doubtful whether the interest rate prevailing in the organised credit market would have very much impact on their behaviour

21 See Krishnamurthy and Saibaba (1981)

22 See Madhur (1984) This finding however runs counter to the theoretical proposition of Modigliani and Blumberg (1954) that the rural sector is more likely to exhibit permanent income behaviour than the urban

23 For instance see Chakrabarty (1977)

24 The possibility exists that if the accelerator parameter dominates the marginal propensity to save, the IS-curve may be upward sloping The likelihood of this, however, is remote and it is therefore assumed away It should be noted, however, that the accelerator term will make the IS-curve flatter than it would otherwise be

25 The slopes of the IS and TT curves in this case are

$$\left.\frac{dY}{dr}\right|_{IS} = \frac{(X' - M2)}{(S' + M1 - I1)} < 0$$

$$\left.\frac{dY}{dr}\right|_{TT} = \frac{(X' - M2)}{M1} < 0$$

It should be clear from the above expressions that the latter will be flatter than the former

26 Since the balancing item in balance of payments is either a draw down of the foreign exchange reserves or increased borrowings from abroad, the effect is the same whether the borrowings are planned or not

27 This phenomenon is referred to as 'crowding in' in the recent neo structuralist literature

28 In order to take the effects of FPI into account, the monetary/financial side of the model will have to be expanded substantially This is not a trivial exercise and will have to be taken up in future research

INFRASTRUCTURE LEASING & FINANCIAL SERVICES LIMITED

ANNUAL GENERAL MEETING: STATEMENT OF DEEPAK S PAREKH, CHAIRMAN.

ECONOMIC REFORM: THE NEW AGENDA

Deepak S Parekh

LADIES AND GENTLEMEN

It gives me great pleasure to welcome you to the Annual General Meeting of Infrastructure Leasing & Financial Services Limited. The financial results of IL&FS are with you, and with your permission, I will take them as read. You would observe that IL&FS has fared well last year: net operating profit reached the level of Rs 397 million for the 12 month period, as compared to Rs 251 million achieved in the preceding 18 month accounting year. Comprehensive coverage of operations is provided in the Directors' Report, and I will not cover the same ground

SUCCESS OF THE ECONOMIC REFORM PROGRAMME

Economic policy, over the past four years since the process of liberalisation commenced, has resulted in a rapid restructuring of the economy of the country, much more in tune with global trends. Successive Union Budgets during this period have for the first time defined medium and long term objectives over successive years and followed this through with consistency and imagination. As a result, fiscal imbalances have been reduced, and the external accounts position is comfortable. There is scarcely a sector from which private investors are now excluded. Tariffs have been systematically reduced across the board, convertibility has been established on current account, and it is likely that we would participate fairly soon in the global forum of nations who enjoy convertibility on capital account. India today, as a result of this courageous process of renewal, is in a far stronger position than at any time in recent memory

IL&FS finds itself in a unique position, as it is the only Institution structured to address some of the most important priority issues facing an economy in transition: infrastructure development, its financing and the process of financial sector deepening. All three processes offer exciting avenues for growth, and unprecedented opportunities stemming from the economic reforms that have been initiated. Privatisation, public private partnerships and Joint Ventures with strong international partners are some of the more promising initiatives that come to mind

I would hence like to take this opportunity to share with you my perspectives on the reform programme and our operating environment. I would also like to address specific issues and recommend concrete steps that the Government could consider as critical components of a new agenda

THE NEW AGENDA

The reform programme stemmed from a crisis where our country was on the verge of an international default. All consequential actions have arisen from the foregoing, including our drive to target Foreign Direct Investment (FDI) and increase exports

It may now be appropriate to consider the new direction we need to take. I do not refer to the so-called unfinished agenda, but I would like to formulate key components of the new agenda that we need at this stage in our development efforts

(1) Whilst dealing with an array of projects and the financial sector, I am confounded by the absence of adequate rupee resources. This situation is peculiar as India boasts of the 16th largest GNP in the world, although the per capita GNP remains low. Simply stated, there are finite limits to our absorption of international debt. If we are to fulfil the productivity target that we have set for ourselves, it is critical that we now focus on generating domestic resources

(2) Government intervention will still be required to direct resources into the infrastructural sectors of the economy given the fact that we lag far behind our real needs. Without adequate infrastructure, productivity gains will remain marginal, and private capital will flow to other reforming countries where the quality of living and the range of amenities are substantially better

India today, as a result of this courageous process of economic reform and renewal, is in a far stronger position than at any time in recent memory

The new agenda must primarily focus on methods to raise domestic resources by creating a buoyant debt market and successfully channelising these funds into the infrastructure sector.

In order to achieve the foregoing, a number of steps need to be concurrently considered by the Government in its role as a facilitator

SAVINGS, DEFICITS AND INSURANCE

Contemporary literature highlights the importance of improving the rate of public savings and reducing the deficit. This is a valid concern as public savings (the excess of Government revenues over current expenditure plus gross profits of public enterprises) have reduced to levels close to zero. It is obviously important that we correct this situation and create the capacity for additional investment. The Government has rightly enunciated unequivocally that all Institutions, including public sector organisations, need to compete in the market place. Winding up procedures under the BIFR are now equally applicable to public sector enterprises, and budgetary support has been reduced to the bare minimum.

The present state of affairs in some of our public sector enterprises is the cumulative effect of poor management, apathy and bureaucratic interference, that has been suffered by them over several decades. It would be naive to expect wonders to be achieved in increasing public savings (as defined) in the near or even medium term. Some enterprises would continue doing well, the weaker ones would either close or be absorbed by others. Clearly, we cannot depend wholly on public savings to boost our capacity to invest. I would hence recommend an alternate and quicker solution. We must open up the insurance sector to domestic and international private sector sponsors

The insurance sector remains closed and appears to be the last bastion of bureaucratic hegemony. There has been significant debate on this subject, and the Malhotra Committee appointed by the Government of India undertook an exhaustive review of the sector. No action has been taken on the Malhotra Committee Report, though it was submitted to the Government over a year ago

The reform programme stemmed from a crisis where our country was on the verge of an international default. All actions have arisen going, including our drive to target Foreign Direct Investment (FDI) and increase exports. I would now like t components of the new agenda that we need at this stage in our development efforts

To my mind, discussions on the insurance sector appear to be distorted and confused, and seem to focus on our obligations under GATT. There is an implicit and underlying sentiment that the international community is forcing us to open up the insurance sector. I believe this approach to be quite misplaced and erroneous. It is more valid to view the insurance sector from two perspectives:

(1) The State-owned Corporations engaged in insurance have for far too long been the instruments of Government's own directed credit system-mobilisers of capital for "priority sectors" at the expense of the insurance industry and the consumer at large. Direct control of these enterprises have made them far too unwieldy for the emerging market economy. The return on life policies is well below what the real actuarial value would require, as a result of the pre-emption of funds for low yielding investments. In general insurance, customers are provided with few options, inadequate realisable insurance claims, and premia which are unreasonably high. The motor sector continues to be a drain. It is only by creating a competitive insurance industry that the consumer will receive a fair deal

(2) The unfortunate focus on GATT obscures the fundamental feature of insurance as a major mobiliser of public and private finances. India today has a per capita insurance premia of US$ 5. This compares unfavourably with Thailand which has a per capita insurance of over US$ 15, Korea at US$ 700 and Japan at US$ 2500. A doubling of per capita insurance is eminently feasible, and would result in an unprecedented savings flow of an estimated Rs 10,000 crores per annum

IL&FS is currently working with the American International Group (AIG) to raise resources for the infrastructure sector through a speciality Fund. A number of Off-shore insurance Companies are seeking investments in the Fund, as the nature of their business requires investments in long term assets. There is thus a close connection between the development of infrastructure, the mobilisation of savings and their flow into core sectors of the economy. Regrettably, the premia collected by our own insurance companies have largely been pre-empted by the Government for its own priorities

Finally, the opening of the insurance sector can be a key stimulus to the mobilisation of long term domestic savings. I would also recommend legislative change to permit brokers in this sector. I am afraid it is intellectual arrogance that has caused us to look upon brokers as avoidable middlemen. In fact, brokers play an invaluable role in putting together contracting parties in conventional brokerage services. This is also true in real estate brokerage, and it is true as far as insurance business is concerned. In the UK, insurance brokers are extremely sophisticated and bring to bear well honed technical skills to carve out complex and tailor-made policies. In the absence of such brokerage houses, it would be next to impossible to formulate policies relating to residual value, disaster coverage, and a host of infrastructure projects

ENCOURAGEMENT FOR NBFCs

The establishment of new private sector banks is a step in the right direction. Prudential regulations have been introduced, and banks now have greater discretion in their lending decisions

However, financial markets will never come into their own until there is initially a recognition by the Reserve Bank of India (RBI) of the complementary roles of diverse players. The perspective of the RBI

we are to fulfil the productivity target that we have set for ourselves, it is critical that we now focus on generating domestic resources

It would be useful if the RBI could recognise the legitimate role played by NBFCs in the stock markets. Unfortunately, we have chosen to kill the messenger rather than heed the message. It is true that a few brokers and intermediaries illegally channelised money from the banking system to the stock market. However, it is retrograde to deny brokers working capital and timely access to the desired quantum of funds from the banking system

The present artificial divide between the monetary system and the capital market will not facilitate the management of the economy. In the US, an increase in interest rates results in a perceptible and virtually overnight shift from the equity to the bond markets. If money supply and interest rates are to be the key instruments for monetary management, such an artificial separation does not provide the managers of money the requisite flexibility and tools that they require

DEBT MARKET

Every forum dealing with capital markets inevitably focuses upon the need for developing a long term debt market in India. IL&FS was actively involved in the promotion of the National Stock Exchange (NSE), and pioneering efforts are being made by the NSE to develop a debt market. These efforts are, however, yet to make tangible progress:

(1) We do not have adequate players in the debt market, and existing players are uni-directional in their trading strategy. The RBI has recently introduced an innovative auction system for primary dealers. However, telephone broking continues with its attendant lack of transparency. A significant fillip would be provided to the debt market if the primary dealers auction is mandated to the screen

(2) There is a continuing ban on Re-Purchase Agreements or REPOS as they are commonly known. Every developed market, including the UK, today regards REPOS as a fundamental mechanism for roll over of long term debt on a short term basis. We will simply not be able to develop a long term market if this ban on REPOS continues. This ban was first instituted following the detection of irregularities in the securities market in 1992, and the ban remains in effect to this day. The fact that a product was misused by a handful of brokers and errant banks does not render the product deficient to a degree that deserves its total elimination

The new agenda focus on methods to raise domestic resources by creating a buoyant debt market and successfully channelising these funds into the infrastructure sector.

(3) Market making is a critical prerequisite for the creation of a long term bond market. Our brokerage houses are inadequately capitalised in relation to the size of the debt market, and the nature of financial commitments that they are now required to undertake. It is essential that back stop liquidity be provided to market makers to cross the hump of illiquidity that periodically plagues our money market. The operations of the Discount and Finance House of India and Securities Trading Corporation of India could conceivably be enhanced to provide back stop liquidity to eligible market makers

LEVEL PLAYING FIELD

In 1991, the aggregate Foreign Direct Investment (FDI) was limited to a paltry US$ 150 million. The RBI has reported the aggregate FDI to be in the region of US$ 756 million upto December 1994 and the quantum of FDI is bound to increase. The flow of FDI has been facilitated by imaginative steps taken by the Government to position India as a beneficiary of the international capital markets

A doubling of per … insurance … is eminently fea… ld would result in an unpre… flow of an estimated Rs … crores per annum

There has been a lengthy debate on the introduction of scrip-less trading, but legislative enactments to introduce scrip-less trading are yet to see the light of day. The existing system of settlements and share transfers is not only cumbersome, but prone to misuse and loss of physicals. The appalling settlement process remains a major deterrent to attracting incremental investments from Foreign Institutional Investors

(1) International capital will flow to countries and projects that provide the best terms. We need to compete for capital. Understandably, overseas investors need inducements including fiscal concessions and tax elimination mechanisms of the type offered through our double taxation agreement with Mauritius. At the same time, it is simply not rational for domestic investors to be taxed at a rate higher than that applicable to international investors

(2) Off-Shore Funds have been provided comprehensive tax exemptions using prevailing dispensation. Regrettably, this mechanism is not available to domestic fund structures which envisage domestic investors joining on a pari passu basis with international investors

LEGAL ISSUES

IL&FS has pioneered commercialisation of surface transport and is currently working closely with the Ministry of Surface

Transport and the National Highway Authority of India to develop projects and bring them expeditiously to a financial close. The Government has today created an environment that is conducive to attracting private sector investment. The legislative framework allows private concessionaires to levy tolls, and specified fiscal incentives are available in relation to infrastructure projects

We have a well developed legal system, but the efficacy of the system leaves much to be desired. Much of our legislation was drafted in the mid 19th century when the sharing of responsibility between the State and the Private Sector was very different. Some legislation like the Indian Electricity Act is truly incomprehensible. There are two suggestions that can be made in this regard:

(1) We need to enact legislation that specifies commercial interests to be intrinsic to implementing infrastructure projects on a commercial format. Other Governments in the Asean Region have introduced such legislation to attract long term investors and project sponsors. It is time that Government took on this task and reformulated the principal elements of a commercial code that are presently embodied in diverse Acts such as the Negotiable Instruments Act, the Contracts Act, the Indian Telegraph Act, the Indian Toll Act, the Sale of Goods Act, etc

(2) We need a system for expeditious and transparent settlement of disputes. In a typical toll road project or in a water supply project, disputes could arise during construction and thereafter. The present judicial system for settlement of disputes is lengthy and tortuous. For this purpose, I would suggest that for the surface transport sector, an authority like the National Highway Authority be vested with the power of a Tribunal to adjudicate disputes. Similarly, the proposed Telecom Authority could be vested with comprehensive powers to take decisions on all disputes relating to the telecom industry

POWER

The Government has acted with imagination and courage in opening up the sector for private investment. Inevitably, the initial response was lukewarm, and concerns centered around the poor financial condition of the State Electricity Boards (SEBs), and practical issues in realising proceeds from sale of power in a timely and efficient manner. The issue of sovereign guarantees for securing investments in this sector has been well debated and I will not dwell on it further. However, I believe there are alternative credit mechanisms that could be developed

> The present artificial divide between the monetary system and the capital market will not facilitate the management of the economy. If money supply and interest rates are to be the key instruments for monetary management, such an artificial separation does not provide the managers of money the requisite flexibility and tools that they require

Whilst considering new power projects, an analysis is typically made of the projected demand-supply of power in the State in which the IPP is sought to be established. This approach is erroneous and steeped in historical thinking. Not so long ago, when an Indian entrepreneur analysed prospects for a new unit, the tendency was to look at demand and supply on a domestic basis. Today, with tariffs crumbling, the demand-supply estimates are almost always made on a global basis. Similarly, we need to move away from the SEB structure and instead examine the aggregate demand for power on a regional basis, and eventually on a national basis

The Government of India is presently implementing an HDVC project at Chandrapur which will permit the transmission of power between the Western Grid and the Southern Grid by synchronising the frequency cycles of the two Grids. Ideally, power could be sold by IPPs to a central agency such as The Power Grid Corporation which has the ability to shunt power on a nation wide basis. The IPP could sell power at the market price through the Power Grid to users of power who are willing to purchase it at these rates. Such a structure would also serve to shift the focus from SEBs to willing and creditworthy purchasers of power on a nation wide basis

SEBs AS PARTNERS

A study of the SEBs would reveal that some of the SEBs are in fact fairly well managed. Unfortunately, State Governments frequently subsidise their constituencies at the level of the SEBs, rather than at the level of the user. A chronic problem is the paucity of funds to implement even current projects. In hydro-electric projects, it is not unusual to find projects languishing for over a decade

The SEBs along with NTPC and NHPC have installed as much as 86,116 MW of capacity. This is not a small achievement, and one that cannot be wished away merely because we desire to attract FDI into the sector. An imaginative policy needs to be formulated to enhance the working of the SEBs and bring more productive capacity on stream quickly. A number of SEBs have either semi-finished projects that are languishing for want of funds, or could have additional capacity installed in the same location. It would be appropriate for the Government to formulate policies whereby specified assets of the SEB concerned are hived off into a separate Company with market consideration being paid. Part of this consideration could be through issue of equity in the new Company. A joint venture partner – either domestic or international – could then be inducted and additional capital raised to facilitate the early completion of the project. Three advantages would accrue under such a strategy:

(1) Existing SEB projects could be implemented

(2) The SEBs would continue to grow

(3) Employees of the SEBs would be protected as they could be gainfully employed in the new venture

We have mooted proposals of this nature to two State Governments, and are hopeful of receiving positive responses very shortly

TELECOMMUNICATIONS

Significant changes have been brought about in the telecom sector and it is likely that an apex Telecom Regulatory Authority will soon be created. Timely steps have also been initiated by the Department of Telecommunications (DoT) to make the bidding process and tenders more transparent. Telecommunications is a field where India can rapidly create infrastructure on par with facilities the world over.

There are two initiatives that need the special consideration of the Government:

(1) It may be useful to consider a merger of common interests between the Ministry of Information and Broadcasting, the DoT and the Ministry of Communications. As technology progresses, the dividing line between these Ministries would become increasingly blurred

Our current deficit in infrastructure is enormous and we no longer have the luxury of extended time frames to upgrade our existing infrastructure to global standards

(2) The boom in cable TV operators and satellite controlled TV clearly indicates that multi media is here to stay. It is thus appropriate for the Government to consider initiatives to usher in a high technology multi media environment as painlessly as possible. We need to bring together diverse agencies to work with each other to create a backbone optic fibre link that would serve as the base for an Information Highway. IL&FS has mooted a proposal to the Government to consider such a link using right of ways available with the Ministry of Railways as well as submarine optic cables. Base infrastructure of this nature would not prove to be overly expensive, and would inter-connect India globally

OPTIMISATION OF INFRASTRUCTURE

Little attention is being paid to optimising existing infrastructure. It is certainly exciting for Government and sponsors to establish a global size plant. It is less appealing to focus on optimising existing infrastructure

The low plant load factor of our SEBs is a common knowledge. A few agencies – notably the National Thermal Power Corporation – have taken strides in examining existing power plants and modifying them to achieve higher levels of productivity. In the process, the incremental cost of power generation is but a fraction of the cost of establishing a new power plant. The time frame for the increased productivity is also much less than that is possible through a green field project

Similarly, there is scope for optimising infrastructure across other sectors. There is a fair degree of dark fibre in our telecom infrastructure sector. We have networks which by themselves are a useful demonstration of what can be achieved, but regrettably our networks do not talk to each other. The co-ordination between the Ministry of Railways and the urban authorities for optimising urban traffic systems leaves much to be desired. Optimisation of existing infrastructure including development of inland waterways is thus a task that the Government needs to focus on with great urgency

PROJECT DEVELOPMENT

Encouraged by the initial responses received from domestic and international sponsors, several Union Ministries have offered to privatise a number of projects within their control. State Governments have also announced privatisation of projects ranging from power plants to projects in the mining industry. The Government is well intentioned, but is today criticised for lack of transparency in choosing its partners, or in permitting construction contracts to be awarded without a tender

It is possibly a retrograde step to insist on global competitive bidding for all projects. Our current deficit in infrastructure is enormous and we no longer have the luxury of extended time frames to upgrade our existing infrastructure to global standards. Two possibilities could be examined:

(1) There is a need for initial project development to be undertaken to define the project in its entirety. The preliminary project cost, the conceptual basis for privatisation – be it user charges, real estate development, etc – the environmental constraints, if any, and the rate of return to the investor must be defined. Once this project development exercise is completed, it is fairly easy for potential sponsors to respond to tenders on the basis of common assumptions In the absence of such project development, tender responses vary tremendously

(2) The Government could also consider making a distinction between project sponsorship and award of contracts relating to procurement. Not so long ago, it was common for the State Industrial Development Corporations to invite an industrial partner for a project on a bilateral basis. Subsequent to the foregoing, Financial Institutions and IDCs together ensured that procurement was undertaken through competitive bidding procedures in order that project costs were maintained at reasonable levels"

There is no reason why we cannot adopt a similar process. I see no difficulty in any State Government or local authority bilaterally choosing a credible sponsor. It will be up to the sponsor and the local authority to ensure that the subsequent procurement process is conducted in a transparent manner

CONCLUSION

India is on the move; we will need to enter a period of accelerated growth if we are to tackle the formidable challenge we face of improving the living conditions of our people across the country. Initiatives taken by the Government have produced tangible results, though we now need to be carefully strategising this growth process over the next decade. The financial sector and the infrastructure sector will be the heart of this process of stimulating growth as they both are critical sectors; they determine the pace of growth of every other economic activity. IL&FS has only just made a beginning; it is my fervent hope that in the years ahead we will be able to contribute as a major player in both these markets

Thank you

Deepak S Parekh

Joint Forest Management

Superior Property Rights?

Shashi Kolavalli

The forest departments in several states are collaborating with communities to regenerate forests by giving a share of the rights to revenues. This paper argues that high costs of excluding unauthorised use has compelled forest departments to accept this change in rights to forest lands. But we cannot expect forest departments to grant a meaningful role for the communities in forest management because their primary motive is to reduce their costs.

JOINT forest management (JFM) is a new approach to forest management which forest departments in several states are employing to rejuvenate forests with the participation of the communities living nearby[1]. The essence of JFM is forest departments' alienation of some of the rights to forest produce to the communities. In exchange for participating in the management of forests the communities gain the right to minor products of the forests and a share of the revenue from timber sales. Alienation rights to land remain with the forest departments; the communities are given only the usufruct rights. The participation expected from communities merely entails protection of forests in most cases. In some cases the communities may be given the opportunity to participate in decisions regarding how the forests are jointly managed. The most significant aspect of JFM is that by alienating some rights to forest lands which are vested in them to be managed in the national interest, the forest departments induce the communities to aid them in their management of forests.

Although experimentation in management through benefit sharing has been going on for several years in a few states such as Orissa and West Bengal, participation of people in forest management was legitimised only in 1988 by the national forest policy. Some of the basic objectives of the 1988 policy are: "Meeting the requirements of fuelwood, fodder, minor forest produce and small timber of the rural and tribal population. Creating a massive people's movement with the involvement of women for achieving these objectives and to minimise pressure on existing forests." [GOI 1988: 2]. The 1988 policy recognised severe depletion of forest cover since 1952 although the forest policy of 1952 had set a target of increasing forest cover to one-third of the country's land area. It attributed the depletion of forest cover to pressure on forests from increasing demand for fuelwood, fodder and timber, inadequate protection measures, diversion of forest lands to non-forest uses, and a tendency to look upon forests as revenue-earning resources [GOI 1988: 2]. The 1988 policy emphasised meeting local needs even at the cost of the protective function of forests because of growing pressure on forests from increasing population [Chaturvedi 1992: 187].

In June 1990 the secretary, environment and forests in a circular to forest secretaries of all states and union territories, further clarified the policy relating to people's involvement in forest management. The circular stated:

> The national forest policy 1988 envisages people's involvement in the development and protection of forests. The policy document envisages it as one of the essentials of forest management that the forest communities should be motivated to identify themselves with the development and protection of forests from which they derive benefits.
>
> the need for working out the modalities for giving to the village communities living close to the forest land usufructuary benefits to ensure their participation in the afforestation programme was emphasised.
>
> the beneficiaries should be given usufructs like grasses, lops and tops of branches and minor forest produce. If they successfully protect the forests, they may be given a portion of the proceeds from the sale of trees when they mature. [GOI 1990: 9-10]

The nature of community participation envisioned in JFM is quite different from participation accommodated in earlier programmes. Forest labour co-operatives, for example, were initiated to put an end to illegal harvests by contractors [GOI 1988: 6]. Forest labour co-operatives supply labour against wages and also receive a small share of the net proceeds from produce marketed through their own depots. They are not residual claimants to forest revenues. Therefore, they may not have any interest in the long term development of forests. JFM, on the other hand, grants certain rights to benefits from the forests to participating communities because of which they have an interest in enhancing forest productivity.

The nature of community participation envisioned in JFM is quite different from participation accommodation in earlier programmes. Forest labour co-operatives, for example, were initiated to put an end to illegal harvests by contractors [GOI 1988: 6]. Forest labour co-operatives supply labour against wages and also receive a small share of the net proceeds from produce marketed through their own depots. They are not residual claimants to forest revenues. Therefore, they may not have any interest in the long term development of forests. JFM, on the other hand, grants certain rights to benefits from the forests to participating communities because of which they have an interest in enhancing forest productivity.

Property Rights and Their Enforcement

Property rights over assets consist of rights, or the powers, to consume, obtain income from, and alienate these assets [Barzel 1989: 2]. A person's ability to realise the potential value of his or her property depends on the nature of rights and the extent to which his or her rights can be protected. The ability to exclude others prevents the property from becoming an open access resource and the ability to alienate and to derive income permits the owner to realise gains from exchange [Barzel 1989: 85]. The extent to which the rights to a property remain undiluted is dependent on the efforts made by the owner to protect them, efforts made by others to capture the asset, and protection provided by the government [Barzel 1989: 2]. Protection of one's rights involves considerable costs. When protection costs are positive, rights to assets cannot be perfectly delineated [Barzel 1989: 3]. This provides an opportunity for others to benefit from the property.

Forest departments though legal guardians of forest with powers to exclude people from making certain uses of the forests cannot effectively do so. They could exclude people by constructing physical barriers. Costs make this option rarely feasible. The other option is to deter encroachment by making it costly for the offenders. Adequate deterrence can be created only by maintaining the probability of capture, prosecution, and harsh punishments at fairly high levels. All this requires information which is costly to gather. Ineffective laws and faulty legal systems dilute deterrence. Moreover, some encroachments may take place in collusion with the staff of forest department in which case the incentives to protect the department's rights themselves may be weak.

In the absence of effective protection, forest departments rights over forests are not fully delineated In order to economise on monitoring or guarding costs forest departments may prevent only those encroachments which are not costly to prevent thereby providing open access to some benefits from forests As an example forest departments may choose to ignore illegal grazing and firewood collection because they are numerous and difficult to prevent The rights which cannot be fully protected become available for others to capture This affects the forest department's ability to realise the full potential from forest lands

The most numerous encroachments are made by those who depend on forests for their livelihood Their encroachment may take the form of livestock grazing, firewood and fodder collection and harvest of non timber and timber products both for domestic use and sale The forests in which such encroachments occur are likely to be degraded Grazing and firewood collection in excess of sustainable capacity of forests are considered to be the major causes for forest degradation Grazing in forest lands is extensive nearly all forest lands in Rajasthan are grazed UP grazing takes place in 83 per cent of forest land in West Bengal over 70 per cent in Sikkim, over 75 per cent and in Nagaland over 53 per cent of forest lands [Lal 1992 42] There is considerable pressure on forests because of the large gap between demand and supply for firewood The estimated total quantity of wood cut in excess of silviculturally permissible limit was 3 245 million cubic metres in the 35 years between 1953 and 1987 This was estimated to have resulted in total destruction of 3 million hectares and in the reduction of growing stock in 27 million hectares [Lal 1992 40]

Less numerous are encroachments intended for harvest of valuable forest products primarily timber They may be less numerous than livelihood based encroachments but their contribution to degradation is not any less They generally take place in forests which still have valuable timber They are also likely to take place in forests which are isolated from the communities They are easier to control But these encroachments may be facilitated by collusion among encroachers politicians and forest department staff

Encroachments could also take place due to political reasons Forest policies create conflict between national and local needs The 1952 policy states that the accident of village being situated close to a forest does not prejudice the right of the whole country as a whole to receive the benefits of a national asset [GOI 1952 419] 'Rural communities also see little coming back to them from their neighbourhood forests managed by the forest departments in the national interest This conflict was particularly strong during British rule when forests were exploited for the benefit of the empire As a result, there was a general defiance of forest laws and forests were set on fire during the movement for home rule in 1916 Resentment from forest related conflicts with the government 'lent inspiration to freedom struggle in Uttar Kannada [Nadkarni 1988 30] In Puri, for example villagers on several occasions raided nearby forests to cut down trees [FRI 1961 79] More recently large scale fellings by Jharkhand activists in Singhbhum is believed to be a protest against the government's apathy towards the region [Chatterjee 1933]

The costs to the forest department of preventing encroachments also differ among different kinds of encroachments The costs include monitoring prosecution and political costs The more numerous encroachments such as grazing firewood collection and harvest of products needed for subsistence which take place in degraded forests are costly to prevent The information costs are high because they are numerous More importantly the political costs are high The communities may view these encroachments as being moral in the sense of communities having a right to a living to the extent local resources permit' [Scott 1976 176] Smuggling and poaching related encroachments should be easier to exclude because they are less numerous, and such efforts are also likely to receive popular support But political support may be weak The potential for large profits and the possibility of collusion as is evident from sandalwood smuggling for example, make such encroachments difficult to control The collusion may be so powerful in some cases that the forest department may lack the incentive to protect its rights [4]

The forest departments have adopted different measures to discourage encroachments One of them is to reduce pressure on forests to meet grazing firewood, and timber requirements of communities One of the objectives of social forestry is to meet these requirements through promotion of forestry in private and village lands The recent forest policy is clear that sufficient fodder fuel and pasture should be provided especially in areas adjoining forests to prevent depletion of forest beyond the sustainable limit [GOI 1988 3] Policing powers of the forest departments also have been strengthened The 1980 forest bill spells out a number of prohibited acts in preserved and protected forests and prescribes punishment for committing these prohibited acts The bill also has provisions for the seizure of implements used in committing these acts Forest officers were given very wide powers of arrest and of seizure of property to deal with forestry related offences [Kulkarni 1989 150] In Gujarat, the forest department has the authority to seize trucks used for transporting illegally cut timber [5] The intention of granting such powers to forest departments is to make punishment more likely, severe and swift As a result, policing has emerged as one of the primary functions of foresters

Forest departments policing has resulted in high political costs particularly when it deprives the locals of their livelihood Conflicts have taken place as far back as 1772 [Troisi 1978 15] The forester is perceived to be an enemy of the people in many places In Gujarat, for example each year an average of 18,000 forest offences are recorded These include 10 000 cases of timber theft, 2 000 for grazing, 700 for fire and 5 300 others [Pathan et al 1991 3] Since the formation of Gujarat 20 forestry officials have been killed in confrontations Between 1985 86 and 1989 90 there were 376 incidents of assaults in which 383 forest officers were injured and four died [Pathan et al 1991 3] Clashes between individuals and foresters occasionally turn into broad-based conflicts between communities and foresters Given the potential for conflicts the forest departments are not capable of effectively excluding people from making what they consider to be illegal uses of the forest

Joint Management

That punitive measures alone were not adequate for excluding people from the use of forests was realised in the 60s itself [FRI 1961 99] The experience of the West Bengal forest department also suggested that traditional methods of surveillance and policing 'led to a complete alienation of the people from the administration resulting in frequent clashes between the forest department and the communities' [WBFD 1988 113] Having realised the futility of protecting the forests armed with only punitive measures, some forest departments began experimenting with involving communities in forest management [Kant et al 1991 2-3, Pathan et al 1991 3] In West Bengal, Gujarat, Haryana, and Himachal Pradesh some foresters began discussions with communities to encourage them to organise and protect forest lands from further degradation People themselves took the initiative in Orissa Bihar and Madhya Pradesh

Communities themselves, particularly through voluntary organisations, have brought pressure on policy-makers to recognise that they are also interested in conservation and that they ought to be involved in forest management [Bhatt 1987] These pressures may have contributed to changes in policy which have accommodated community participation in forest management But the principal factor which has led many forest departments to experiment with community involvement in forest management and also become receptive to joint management is their inability to prevent encroachments so as to be able to put forest land into productive uses as they perceive

them. The need to involve people in forest management was recognised in the 1952 policy itself. The policy stated

> No forest policy however well intentioned and meticulously drawn up, has the slightest chance of success without the willing support and co operation of the people. The recognition of their rights to forest produce at concessional rates, or, free or royalty is not by itself enough. What is necessary is to instill in the people a direct interest in the utilisation of forests. [GOI 1952 427]

However, mechanisms necessary to instill direct interest were not introduced by the forest departments. But as exclusion costs progressively increased because of the rising number and the severity of infringements the forest departments have become more receptive to creating a direct interest in the communities. The shift in policy towards joint forest management has been primarily to find a property rights structure which would make exclusion more feasible and less costly to the forest departments. This is fairly evident from JFM policy statements of various states which have made some progress in implementing JFM.

Bihar

> It is necessary to rehabilitate these forests and increase their productivity. After serious deliberations the government has reached the conclusion that the management and protection of forests close to the villages must be done with the co operation of the village people. [GOB 1990 11]

Gujarat

> Responsibility of the village community are (i) To protect forest land from encroachment cultivation fire felling and grazing. (ii) The community through its members will prevent any damage to the forest area allotted by any unauthorised persons and will inform the forest officers concerned for taking necessary action. [GOG 1991 16]

Haryana

> Presently one of the major roles of the forest department is to police the surviving forest resources. This results in a continuous confrontation between local villagers who need to exploit these resources for survival and the forest staff who are duty bound to protect them.
>
> The essential learnings from Sukhomajri and Nada were the following: that social fencing by village communities can be more effective in protecting forest areas than any amount of policing by the forest department.
>
> The basic philosophy underlying the proposed policy is to link the economic interests of villagers adjacent to forest areas with sustainable management of those areas. [GOH 1990 18 19]

Jammu and Kashmir

> Whereas active participation of local people is vital for regeneration, maintenance and protection of plantation done for afforestation and rehabilitation as aforesaid, [GOJK 1992:26].

Karnataka

> In spite of several measures like increase in staff communication network and increased intensive patrolling, etc, the desired results have not been achieved. Keeping this in view the state government desires that people living in the villages adjoining the forest areas should be actively involved in the conservation planning and protection regeneration of degraded forests. [Karnataka government order quoted in Hegde 1994]

Madhya Pradesh

> It has been noticed by the government that damage to the government forest is increasing day by day due to illegal cutting and encroachments by some organised gangs. It has been brought to the notice of the government that in spite of adequate measure taken in such sensitive areas such as increasing the number of forest officials intensive patrolling and other arrangements satisfactory results have not come so far. Keeping this in view the state government has now come to the conclusion that until residents of villages adjoining the forest area is sensitive to damage give their active co operation to the forest department in the protection of forests it would be impossible to protect the forest areas fully.
>
> In order to get the co operation of the villagers in the regeneration of such forest areas it is essential to give them incentive by way of a share in the forest produce. [GOMP 1991 38]

Maharashtra

> The illicit cutting of trees from the area is increasing for various reasons. The relevant laws and regulations imposed by the government are not sufficient to prevent the destruction of forests. People's co operation in protecting the forest is very essential. [GOM 1992 44]

Orissa

> After careful appraisal the government is of the view that the task of protecting forests is so urgent and so enormous that the rural community should be fully and actively involved in it.
>
> The assigned villagers shall be responsible for the protection and prevention of illicit felling thefts of forest produce and encroachments in the assigned reserve forest areas. [GOO 1988 50]

Rajasthan

> Since the task of regeneration of such forest lands by afforestation is quite voluminous the success of the efforts made through the state government's resources and manpower has been limited. It has been decided after thorough discussion of the subject at central state and other levels that for the conservation, development and management of such degraded and denuded forest land co operation and participation of the local villagers and voluntary agencies through gram panchayats may be sought from this year. [GOR 1991 52]

Tripura

> Whereas active participation and involvement of local people is vital for regeneration maintenance and protection of aforesaid forests/plantations and successful implementation of the programme.
>
> Now therefore the governor is pleased to decide that forest protection and regeneration committees shall be constituted for this purpose and beneficiaries acting as members of such committees shall be allowed as a measure of incentive usufruct defined herein after para 4 subject to observance of the conditions provided in this resolution. [GOT 1991 57]

West Bengal

> Whereas active participation and involvement of local people are vital for regeneration maintenance and protection of aforesaid forest/plantations and successful implementation of the programme,
>
> Now therefore the governor is pleased to decide that forest protection committees shall be constituted for this purpose and beneficiaries acting as members of such committees shall be allowed as a measure of incentive 25 per cent of the usufruct subject to observance of the conditions provided in the resolution. [GOWB 1989 62]

The perceptions and intentions of policymakers in various states are explicitly stated in their policies. The forest departments have failed to maintain forest cover or improve degraded forests. They will be able to do so only if they involve the communities in forest management. Social fencing is more desirable and effective than policing. Protection from thieves requires the co-operation of the people living nearby these forests they can assist the forest departments by providing information. A direct interest in forest development can be instilled in the communities by giving them a share of the forest revenues.

As the principal motive of the forest departments in promoting JFM is to arrive at a property right structure which reduces their exclusion costs there may be a basis for understanding the reasons for differences in the enthusiasm with which the forest departments are initiating JFM in different states and the types of the forests which have been brought under JFM. Forest departments are least able to exclude people without antagonising the communities where pressure on forests is high because of livelihood-based encroachments. Therefore forest departments in states where there is considerable forest dependent population with degraded forests in the vicinity of communities are likely to be most enthusiastic about JFM. Where theft of high value products is the primary problem punitive measures are likely to be more effective as they would not be objectionable to communities and the forest departments are less and likely to enter into JFM.

Along the same lines one can also hypothesise that forest departments would like to bring under JFM only forest lands which they cannot manage single handedly. Only those degraded lands whether forest depart-

ment or community owned which have the most potential for improving productivity under shared rights will be brought under JFM In Gujarat, for example only forests which are heavily degraded in terms of tree cover) are available for JFM The legal status and the condition of these lands may vary from state to state The states are clearly not interested in sharing rights to productive forests.

Appropriate Property Rights

As property rights to an asset influence how it is utilised one can think of one set of rights being superior to another in terms of the potential of the asset realised According to Barzel (1989 5) maximisation of the net value of an asset requires an ownership pattern which can most effectively constrain uncompensated exploitation As there are costs associated with rights protection and these vary from one situation to another the nature of property rights which prevail vary according to the nature of assets and the uses to which they are put In the case of land they may vary according to the use resources or circumstances involved [Baily 1992 195] To explain the transition from common lands to private lands in New England agriculture Field (1985 364 65) argues that the optimal commonness for using a natural resource is determined by changes in (i) exclusion costs (ii) total value of common property externalities in the communities and (iii) transaction costs of reaching agreements among users Changes in exclusion costs from technological development for example can lead to changes in rights The potential for reducing exclusion costs possibly through changes in the rights themselves provides an opportunity to enhance the value of an asset

A property rights structure which vests the rights to revenues from major products of the forests with forest departments alone may yield less than the potential benefits from forests Forest departments inability to exclude resulting in open access to forests may lead to the unsustainable harvest of forest It can also influence how they manage the forests They may develop forests which yield only timber This is done through planting of what are known as defensive species which can withstand grazing and are unsuited for fodder The consequence therefore of current rights which lead forest departments to pursue timber production is a gap between the potential and actual value of output from forests Forest lands could be put to better use when they are managed to meet both timber and non timber needs such that the total value of output is high Forest management decisions under the current right structure overlook the value of non-timber benefits to communities

A change to a more productive set of property rights may come about when the prospects of getting a share of the benefits from doing so provide incentives for interested parties to reassign property rights [Libecap 1989 15] The interested parties who may influence policies affecting rights are (i) communities which traditionally have had access to forests (ii) the forest department and (iii) industry The communities have faced both an erosion of their rights to forest products and reduced flow of benefits to which they have rights They often attribute decline in productivity to forest policies and demand transfer of rights to communities to enable local management of forests as common properties The industry would like greater direct control of forest lands so that supply of their inputs becomes more secure The forest departments/government have come under increasing public scrutiny and pressure to increase tree cover following the realisation through satellite imagery that forest cover in the country is much less than actually believed Between 1972 75 and 1980 82 the forest cover had actually gone down from 16 9 per cent of geographical area to 14 1 per cent [Nadkarni 1988 160] All parties have an interest in changing property rights But the interest that is of most consequence in reassigning the rights to the forests is that of the current holder of the rights the forest department

An optimal bundle of rights from the point of view of the forest department is one in which its power to put the land to uses which it perceives are in the national interest is not diluted and its revenues remain the same if not grow One option available for the forest department is to lease degraded forests to industries for captive plantations But leasing forest land to commercial firms is not always acceptable to the public The decision of the Karnataka state government to allot government land for developing a captive plantation was challenged in the courts [Gadgil and Guha 1992 192] The forest departments themselves may oppose captive plantations when they diminish their control over forest resources and warrant scaling down of their operations Moreover they enjoy the current position of being monopoly suppliers of scarce industrial inputs at controlled prices

The other option is to involve communities A desirable bundle of rights from the point of view of the communities is one which gives them the access to forests which they have traditionally had and a share of revenue if not a complete control over forests which would give them the incentive to invest their resources in forest development However it may also be wrong to assume that people always want forests to be developed as forests or that they should be managed by communities Even tribals traditionally presumed to favour collectivist traditions may desire to become private landowners and therefore seek regularisation of 'illegal' cultivation of forest lands [Shah 1994]

A set of rights which would encourage co-operation between the forest department and the communities is one in which the communities feel that they have a fair share of the revenues which is commensurate with the efforts that they put into joint management, and the forest department feels that its own revenues and powers are not diluted while maintaining or improving tree cover The requirements of the two parties can be the basis for determining an optimal share of rights between the two parties in JFM A share acceptable to the communities is one which they feel is (i) at the least commensurate with additional efforts that they put forth, (ii) fair If the share is not fair by the standards of the community, they will perceive the agreement to be exploitative The conflict between a community and the forest department regarding sharing of benefits is akin to one between a landowner and a tenant

Because of historical ownership patterns, the relationship between the forest department and the community has come to be that of a patron and client This view may not be acceptable to those who consider communities to be the legitimate owners of forests But it is only in this context that we can examine whether the relationship under JFM is exploitative or an unfair distribution of efforts and rewards The existence of injustice or exploitation implies that there is a norm of justice But the difficulty is to come up with an acceptable norm which is also consistent with the subjective feelings of the exploited [Scott 1971 158 59] Two principles that seem to underlay what is moral are the norm of reciprocity a notion of equal exchange and right to subsistence (1971 167) As Scott suggests one must examine the notion of justice and values of real actors rather than begin with abstract normative standards [1971 160] Community perception of what is fair is reasonable Folk conceptions of justice do have a rational and realistic basis, and arrangements that depart from this basis are likely to need deception and force the more they do depart [More quoted in Scott 1971 171]

Even from a limited perspective of the forest department to buy protection through social fencing from the communities an optimal share for the communities is one which is congruent with what is considered to be moral by communities Unless the communities consider the shares offered to them to be fair or moral, they would have an incentive to cheat on the agreement Unlike Scott's view that peasants are concerned only with what is left to them in a relationship, they are also interested in what is taken away A decent return to efforts that they put forth provides only a lower estimate of what is considered moral by the participants Our case studies in Gujarat suggest that the communities feel that a 50 per cent share of the forest department is unjust as the communities put

for much of the effort and the forest department earns by merely being a landowner

The sharing of revenues is not the only aspect of joint management that is of concern to communities The right to derive income from a property also includes the right to decide what to do with the property This is the empowerment' for which social activists are calling To instil a sense of ownership the communities should be given an opportunity to participate in planning as well The legislation in some states Bihar, for example is clearly intended to 'use people to meet the objectives of the forest department and not engage in joint management in any meaningful sense The societies established by the district forest officers are expected to assist the forest departments The do not even have the freedom to decide what they do with their share of benefits Such legislation is hardly likely to instil direct interests

When the terms of contract are conducive to instil a sense of ownership in the communities the bundle of rights inherent in JFM result in a better alignment of incentives and information about the scarcity of the resource It will permit greater realisation of the land potential compared to state ownership The increase in the value of output will come from (i) sustainable harvests of timber and non timber products of forests in existing forests (ii) increase in the value of outputs through planting of species valuable to the communities and (iii) increased investments in new forests On the cost side protection costs will come down as community participation increases As communities develop institutions to govern their behaviour social fencing will replace policing by the forest department The total protection costs per unit value of output should also come down It will enable development of lands which would not have been developed otherwise Without joint management the forest department can only retreat back to forests which it can protect effectively

There are several reasons to expect productivity of land to be higher under JFM compared to forest department ownership All grazing of forests particularly unlimited or uncontrolled grazing is considered to be incompatible with scientific forestry [GOI 1952 424] That the forest departments consider controlled grazing to be important for increasing land productivity is evident from the fact that JFM agreements in most states insist that communities control grazing The total value of products produced from forest land could be significantly higher under JFM when what is of value to the community and the land capability become the prime considerations in the selection of species Our case studies of JFM in Gujarat show that choice of species for planting has been done in consultation with the communities, production of timber has not been the only consideration.

The states also recognises that even with sharing of output with the villagers, their revenues will not be reduced as increase in productivity will more than compensate the loss from sharing with communities Moreover what the communities will get is a share of output from forests which were not productive prior to JFM the forest departments are not giving up their revenues The policy statement of the government of Haryana is explicit

> For the state government there will be no loss in existing revenues (if any) from the concerned areas The present levels of revenue will be maintained and in certain cases there will be increase over a period of time Simultaneously through the government's adoption of the policy of sharing the bulk of the increased production resulting from villagers participation the villagers economic status will improve substantially without any additional cost to the government Further with the villagers accepting responsibility for protection and management of forest areas near the villages the department's future costs for protection and rehabilitation will be substantially reduced [GOH 1990 19]

The gist of this policy statement is that under JFM an increase in the value of production and a decrease in the transaction costs of enforcing rights can be expected When forests are developed with the involvement of people the potential for increasing the value of forest output would be significant Property rights modified for joint management make it possible to invest in land improvement or afforestation hitherto considered unviable because of high protection costs JFM also provides a means for the state to create social capital utilising labour in rural areas

Open Access to Common Property via State Control

The state's involvement in forests began with Chandra Gupta Maurya (300 BC') when there was a superintendent of forests part of whose duty was to protect wild life in forest areas [FRI 1961 72] The forests under the Hindu rulers were classified for various purposes with limitations placed on their use Subsequently, during the Muslim rule only specified species of valuable timber were proclaimed by local rulers as 'royal trees' and royalty was collected for their extraction Property rights were developed only for valuable species Otherwise, the forests were open to everyone But there was customary regulation of rights over forests [Kulkarni 1989 140]

Subsequent to appointment of a commission to enquire into the availability of teak in Malabar forests in 1890, regulations prohibiting the felling of teak below [illegible] inches in girth were introduced In 1805 forest committee was constituted to enquire into the capacity of forests and the status of proprietary rights in them The committee found that the more accessible forests had been overworked A proclamation declared royalty rights over teak trees in the south and prohibited unauthorised harvesting of teak [FRI 1961 73] As population pressure increased, forests which were open access resources were brought under state control Even under state ownership communities had free access to forest lands

Private ownership of forests was also not considered to be in the interest of the state In 1864 the governor general suggested to the secretary of state that allowing proprietary rights to forests to individuals should be abandoned as such rights were almost certain to lead to destruction of the forests He also suggested that all government forests should be strictly set apart and made inalienable, some provision should be made for existing private rights and it would be good policy to extinguish even those rights on equitable terms wherever possible [FRI 1961 76] State control was used as a solution to forest degradation under both open access and private control of forests

Though forest lands were brought under the state control to be managed by forest departments district administration or village panchayats they effectively became open access resources to various degrees because of high protection costs JFM is an attempt now to make them common properties of communities with clear boundaries to exclude non members and institutions which govern how members use the resources The institution of common property is being employed as a solution to degradation of forests due to open access [Ciriacy Wantrup and Bishop 1975]

JFM may be a step towards the development of forest policy as if people mattered, balance of power and people's power as a check for bureaucratic power" as articulated by Baxi (1983 103) The evolution of JFM, particularly in terms of changes in the position of the forest departments, is not driven by any desire to bring about participation in any sense larger than building social fences Therefore it is perhaps too much to expect JFM to meet the criteria of participation along the lines suggested by Arora (1994 697), viz, principles of empowerment, autonomy, self-realisation, and effectiveness [p 697] In a recent case in Karnataka where the forest department is implementing joint management with the support of ODA, the forest department fenced off the forest and terminated the involvement of a community which was not pliable [Hegde 1995] Even under the proposed bill, the communities will play a subservient role [Kulkarni 1994] The forest departments' alienation of some rights to communities in exchange for their participation is not an act of generosity The forest departments would retain all the rights if they could regenerate forests without co-operation of the people, they have no choice given the current technology of exclusion.

Notes

[Rolf Mueller made valuable comments on an earlier draft of this paper I have also benefited from discussions with my colleagues Samar Datta, Gopal Naik and Devi Tewari Responsibility for deficiencies still lies with me]

1 The number of forest protection committees or community organisations engaged in joint management in different states were as follows 413 in Bihar 200 in Gujarat, 36 in Haryana, 272 in Jammu and Kashmir, 1,181 in Orissa and 2,110 in West Bengal The area under protection in Orissa where joint management has been in practice the longest is about 3 per cent of the total forest area [SPWD 1992 83 87]

2 The performance of these co operatives has not been consistent The societies have difficulty working with the forest departments as the forest departments prefer to work with contractors Control of many societies has also been seized by unscrupulous elements They have worked satisfactorily only in a few places such as Dangs district in Gujarat where all timber extraction is done through these co-operatives [Gadgil 1983 124]

3 There can be legitimate conflict between local and national needs when there are externalities For example, Himalayan forests are treated as national assets whose degradation have serious consequences for agriculture in the plains

4 In such situations, some communities in Assam have taken it upon themselves to protect the forests [see Raju et al 1993]

5 Timber from four good trees can be expected to yield Rs 1,20,000 [Sainath 1993] Small fines alone cannot deter activities which have high expected returns

6 Forest protection committees are also effective in assisting the forest departments in controlling smuggling Recently a forest committee in Palamu area apprehended a forest officer smuggling timber [Sainath 1993] The forest departments are finding effective allies in people Tribals have been hired as forest watchers in forest reserves in Tamil Nadu They have used to their advantage tribals' understanding of forests, ability to endure long hours of work, familiarity in dealing with wild animals and knowledge of poaching [Padmanaban 1993]

7 This has the potential danger of creating incentives for communities to hasten degradation of forest which they would like to have brought under joint management

Agrarian Forces and Relations in West Bengal

J Mohan Rao

IN a paper candidly acknowledging the rural rides' rather than extended research on which its conclusions are based, John Harriss ('What Is Happening in Rural West Bengal? Agrarian Reform, Growth and Distribution' *LPW*, June 12 1993) has nevertheless put us in his debt by providing a sweeping interpretation of the changes occurring in the Bengali countryside over the period of Left Front rule. He squarely confronts the Marxist/ social-democratic /reformist government's claim that the significant improvement in West Bengal's agricultural performance and in the living standards of its rural poor are due to the structural changes in agrarian relations brought about by its reform policies. And in arriving at his negative verdict Harriss finds reason to set aside previous diagnoses of the causes of agricultural stagnation based on the distribution of rural property and power and the modes of surplus appropriation they support.

This much in his paper is quite clear. On the positive side however, there are discordant notes within the paper. West Bengal's own belated 'green revolution', he contends in the concluding section, is less the result of state initiated reforms of the relations of production than of the state's 'focus on the expansion of the productive forces' (p 1246). That is to say, state policy was an element in the success even though the state itself is unaware which of its policies proved successful. Yet the bulk of the paper leaves the impression that even this compliment is not seriously meant. By registering considerable scepticism about the channels through which the state's focus on the productive forces might have taken effect, Harriss ends up arguing that private initiative and investment were largely responsible for the breakthrough.

This note seeks to draw the reader's attention to Harriss' questionable interpretation of the record (based principally on field observations on village Jungul in 1982 and 1991 but buttressed in various places by references to macro and secondary sources) and suggests why the interpretation he rejects deserves far more serious scrutiny. To be sure, Harriss is only too well aware that state policies may have worked in both direct and circuitous ways. This awareness allows him to nuance his main conclusion (not to say confound the reader). It is useful therefore to begin with a summary of his main arguments together with their qualifications.

Jungul changes. There was a breakthrough in agricultural production and an improvement in rural living standards in West Bengal which was also clearly observable in Jungul. *Reform efficacy*. Prior change had robbed tenancy reform (Operation Barga) of its potency, land redistribution was insufficiently deep to make a significant dent on land inequality or associated relations of power and dependency, credit programmes oriented to the poor have helped but probably much less than changes brought about by the growth of production. *Irrigation growth*. The expansion of production is the result mainly of investments in shallow tube-wells (STW) coupled with increased use of fertilisers and new HYV and complemented by some growth in the use of tractors as well. *Growth effects*. While there has been all round output expansion, its main manifestation has been the growth of 'boro' season cultivation through short term leasing of land which has become an important source of income for the poor. This source of income has in turn financed the purchase of land by the poor with a consequent reduction in land inequality. Both these developments contributed to the decline in paddy loans and the control exercised by rich peasants through command over credit. Thus, the growth of production led the major observed changes in wealth distribution and in land and credit relations (not the other way around). *Growth causes*. Panchayati co-ordination and organisation proved to be neither barriers nor facilitators of STW investments nor did state (panchayati) subsidies figure importantly as a factor, therefore, private initiative and private investment, private informal land consolidation and the development of water markets have been responsible for irrigation development. The driving force behind the growth of irrigation was its new profitability induced by the availability of a suitable HYV and a more favourable nitrogen fertiliser/paddy price ratio (sustained, it should be noted, by central government fertiliser subsidy and price policies).

These arguments together add up to the main conclusions reached by Harriss that reforms were neither deep nor effective in changing power and property relations, that private investment has transformed the productive potential and led to major changes in living standards and most importantly, that the groundwater puzzle – the recent exploitation of a long unfulfilled potential – is sufficiently resolved by reference to technological and price factors thus dispelling the hypothesis that productive forces were impounded by production relations. Harriss' perspective may not be 'classical' and productionist (p 1244), a charge Harriss (perhaps rightly) levels against the official view however it certainly appears to be a singular example of the trickle-down and technocratic model of growth.

The most important of these is his observation for Jungul that significant wage increases were brought about by direct CPM-led actions that contributed to improving or at least maintaining living standards (given that wage employment per worker fell at the same time). He believes that this effect was decidedly more important than the direct effect of the land reforms while allowing that reforms may well have contributed to the political support which has made action on wages possible (p 1243). Another concession Harriss makes to the view that 'politics are important' (p 1243) is that labour actions prompted landowners to operate land in the boro season through short term leasing, virtually a form of piece-rate system, rather than with wage labour. In short grass roots labour organising contributed directly or indirectly to the rise in living standards. Notably however these did not contribute to the production breakthrough itself at best they affected the choice of production organisation to serve as the vehicle for new production. At the same time, the government's 'focus on productive forces" as a contributory factor remains a largely empty declaration by Harriss given that he assiduously undermines it.

Hence, despite Harriss express scepticism about the feasibility of quantifying the relative contributions of the determinants of growth, the unqualified arguments stated above still represent a fair picture of Harriss' position. In fact, it is hard to see how Harriss can make any of the basic claims he makes without at least an implicit hierarchy of relative contributions of the various growth factors. The clear 'line (of causality and political evaluation) that emerges proceeds as follows: technology and price factors →→ private initiative and investment→→boro-season leasing→→increased poor peasant incomes→→reduced land and credit inequalities (I hasten to reiterate that there

is enough in the paper to confuse even the careful reader Thus, Harriss states clearly that the successful change in Jungul in the 1980s did not result at all directly from the agrarian reforms (p 1243) leaving open the possibility that these reforms may have contributed indirectly)

II

Grounds for scepticism about Harriss hypotheses are best stated seriatim as follows

(1) Did price *and* technology variables increase the gross profitability of capital investment? Harriss identifies the availability of suitable HYV (IR 36) and a more favourable N fertiliser/paddy price ratio as the prime movers of the green revolution (though STW investment was a crucial element – least oil powered engines were of a new technological element) Between 1982 and 1991 the fertiliser/paddy price ratio had fallen by a third But according to his own data the wage/paddy price ratio had risen by two thirds (p 1243) Harriss insists on the significance of both of these numbers the first as a spur to irrigation investment and the second as a cause of rising living standards of the poor Yet these numbers work in opposing directions as far as the effect on private profitability is concerned For a given level of yield the share of surplus in output would have fallen if the fertiliser share was no more than twice as large as the wage share – a condition that must have undoubtedly held If profitability rose nevertheless which Harriss central thesis requires, this must have been due to higher productivity from the new varieties sufficient to compensate for the unfavourable movement in relative prices and wages

(2) Did changes in capital markets (or credit relations) raise the net profitability of capital investment? During the decade, paddy loans declined substantially and poor peasants accumulated enough funds even to purchase some land The peak season paddy price premium fell from 51 per cent in 1982 to only 22 per cent in 1991 Evidently, the control of rich peasants on capital declined significantly Harriss seems eager to attribute all of these changes to the increase in investment and production He does not entertain the *reverse* line of causality with falling returns on loans and stocks stimulating productive investment It is at least possible that the effective opening up of formal credit (including that due to poverty-oriented rural credit programmes) and wage actions served to improve the net profitability of irrigation investment in the first place (by reducing its opportunity cost in the form of returns to loans and paddy holdings) and that this then set up a virtuous cycle of rising production, declining credit dependence (and interest rates), a further rise in productive investment and so on By Harriss' own reckoning rich peasants appropriated significant amounts of surplus (both directly in interest charges and, more so indirectly through the seasonal premium in the product market) owing to their control of paddy lending prior to the recent changes

(3) Even if it turns out that the fertiliser/product price relative and technology variables were exclusively or principally or at all responsible for the rise in groundwater investments does this prove that politics or production relations were irrelevant to that extent, i e, can variations in technology and prices be separated from political economy considerations? The institutionalist or political economy perspective is not a straitjacket No doubt in some interpretations, the stagnation imposed by production relations is an absolute constraint that can only be relaxed through changes in production relations (call this a classical or 'productionist' perspective if you like) In reality the price of investment and of changes in technology may vary over time and it is naive to suppose that they only occur in discrete jumps each entailed by a rupture of some sort in production relations A more sensible interpretation will therefore allow that price configurations may change sufficiently to render previously unprofitable investment profitable But this does not render the price configuration exogenous to political economy The fertiliser subsidy and food pricing policies that underlie Harriss' priest' claims were of course not creations of Jungul production relations or even of the West Bengal government but they certainly were the artefacts of the central government These policies have been at the centre of the political economy of state interventions in agriculture for well over two decades now This is not the place to delve into an analysis of the issues this poses and how they might impinge on the question at hand (the West Bengal green revolution) Suffice it to note that the Left Front government's role will be accordingly devalued (though not rendered irrelevant) in such an analysis By the same token, however our understanding of the economics of the green revolution in West Bengal must remain incomplete without consideration of the political economy of interests and state policy in the Indian economy at large Prices are not separable from production relations, in this sense, within West Bengal and without

(4) How important and effective were state efforts ('focus on the productive forces') to improve the irrigation situation? Harriss wants us to take at face value his claim that irrigation investment subsidies were of little importance Similarly, he dismisses the role of village electrification or electricity subsidies while characterising Lieten's view that the panchayati mechanism worked well as unsupported by data His claims are not any better supported Considering that state initiatives in this area however 'inefficient' they might have been appear to have been effective in relaxing constraints on private investment elsewhere, a more thorough investigation is clearly required

(5) Since the debate over technological stagnation/dynamism in general (and the West Bengal 'groundwater puzzle' in particular) is conventionally framed in terms of the forces/relations link it is important to be clear what is to be included in the relations of production Harriss' pronouncements on this debate are conceptually ill founded Ordinarily the state's direct involvement in a private property economy is ignored as of secondary significance But in the present context this may not be warranted The state is an important agent (for better or for worse) in production just as the economy is ridden with political practices The political basis of the state is therefore part and parcel of the relations of production as they impinge on technology Harriss seems to accept the relative autonomy of the Left Front government from the dominant classes because it rests on classes other than the propertied At least to the extent that points 2 and 4 above are borne out it is inappropriate to separate the state from production relations This means that in resolving the groundwater puzzle, we must consider the *potential* for a breakthrough created by the coming to power of a relatively autonomous state and consider that this in itself may constitute (at least) a potential change in the relations of production'! Insofar as improved performance has depended on the actions of such a state, whether by altering agrarian relations in the narrow, productionist sense or by tapping existing production potentials, *ipso facto* the improvement is attributable to a change in property relations in the broad sense To claim otherwise would be to maintain an artificial separation between the political and economic realms which is unsupportable

These questions constitute no more than working hypotheses concerning the Bengal breakthrough It is not only that these hypotheses run counter to Harriss' key conclusions We hope this note has also served to show that the evidence that Harriss presents supports his conclusions no better than they do our alternative hypotheses

Promises Performance and Proofs.....

THE UNITED WESTERN BANK LTD.

HEAD OFFICE: 172/4, SHIVAJI CIRCLE, RAVIWAR PETH, POWAI NAKA, SATARA-415 001

Here are the financial results of year ended at 31st March 1995 The results are the proofs of the promised performance

HIGHLIGHTS

Profit up by 165% from Rs. 3.86 crores to Rs. 10.23 crores.
Deposits Rs. 1432 crores.
Rise 30% Advances shoot upto Rs. 773 crores.
Rise in foreign Exchange Turnover by 407%

At a Dead-End?

The Tenth Finance Commission has received quite deservedly, handsome compliments for its crisp, concise and highly readable report But the pertinent question is do the commission's innovations and new formulations help to address better the basic tasks which every large federation has to face and which constitute the rationale for the creation of the Finance Commissions under the Constitution viz redressing the vertical and horizontal fiscal imbalances inherent in the distribution of powers and functions among the centre and the states and the disparate levels of income and development across regions' **1985**

Civil Society and Its Enemies

The relative autonomy of civil society that is communities and collectives of the people often informal and inarticulate within a particular political structure – is being perceptibly eroded by the advancing process of overbearing economic political and cultural influences of remote forces beyond their palpable reach How to defend civil society against these encroachments in order to expand the space for the people's own articulation and action this is the problematique of the new interest in civil society and its role **2005**

New Agenda for Kerala

While the experience of Kerala shows that the mass of the Indian people do not have to necessarily wait for an indefinite future for the hump of economic growth to be crossed for schooling housing primary health care adequate food and so on the contemporary crisis the state faces also underlines the limitations of what can be achieved within the present system and how difficult it is to sustain much less expand welfare gains in the absence of growth The challenge is to enlist the increased political consciousness and organised strength of the people as an instrument to accelerate economic growth in a democratic fashion and correct the distortions in the social and cultural areas **1993**

Lessons of Enron

The Enron episode has brought out the high cost to the nation not of just this particular deal had it gone through but of the open door policy towards multinational corporations and foreign capital which is such a vital part of this government's economic reform **1953**

Law and Society

As social change/reproduction is not affected by any single social stratum in isolation different strata perceive social forces differently depending on their location in the existing order and attempt to modify them Law and its evolution is part of this social process but the task of integrating social relations and legislation in a unified field remains unattended **1974**

At Market's Mercy

Development planners pleading for marketisation of the social infrastructure and basic necessities admit the possibility of, and perceive no great danger in, allowing the parameters of physical existence to be determined by what individuals and communities can afford This is to make a conscious, if unproclaimed, choice to allow the majority of the people to live in a manner that degrades human life slowly but systematically **1955**

Unconcerned

The issues which provoked the Gowari tribals in Maharashtra to mount their large scale protest last year which caused a large number of deaths in the police lathi charge are yet to be addressed by the state government **1959**

Ernest Mandel

What was remarkable about Ernest Mandel, who died last month at the age of 72 was that he could inspire great respect at both levels – as an exceptionally gifted intellectual, particularly in the domain of economics and as a revolutionary theorist **1956**

Rebel in Saffron

In the death of Thiru Kunrakudi Adigal, Tamil Nadu has lost a prominent public figure for whom religion signified a celebration of the human will and spirited engagement with this worldly inequalities **1957**

Egypt's Troubles

The compulsions of accelerating developments in West Asia and North Africa are demanding a reorientation of Egypt's political and economic relations and a reassessment of its role in the region **1960**

LETTERS TO EDITOR

Dalitbahujan Intellectual Forum

FOR perhaps the first time in the intellectual history of India, an organisation of dalitbahujan intellectuals has been formed at a two-day conference held at New Delhi in May The conference was attended by 150 scholars, writers, thinkers academics civil servants and activists belonging to SC, ST, OBC and minorities The thematic agenda for the two day deliberations was (a) historical, philosophical and ideological aspects of the dalitbahujan alternative, (b) alternative socio economic and political programme, and (c) strategy and tactics of dalitbahujan movements

S K Biswas and A K Biswas made brief presentations on the first theme The main points that came up for discussion were that so far Indian history and philosophy reflected two schools of thought – Hindu nationalism and brahminical marxism The third alternative of dalitbahujan thinkers and researchers should be based on Buddha, Phule Ambedkar and Periyar's thought However this era could be called the era of Ambedkarism which combines in itself the democratic aspirations of marxism as well Since this is a period of dalit democratic revolution the principal contradiction locates itself in a struggle between the dalitbahujans on the one hand and the brahminical upper castes on the other In other words the principal fight is between dalitism and brahminism Though there are contradictions among different castes within the dalitbahujan forces which got hierarchised because of brahminical casterism the contradictions among different dalitbahujan castes are friendly contradictions that constantly get mediated by the labour process A serious attempt to reconstruct Indian history philosophy and ideology in the context of the ongoing dalitbahujan political movements to unite dalitbahujans is a must

Thomas Mathew and Kancha Ilaiah made a brief presentation on the possible socio economic and political alternative While the achievement of state socialism, as suggested by Ambedkar is the transformatory programme of the dalit democratic revolution the ultimate aim is to establish a casteless classless and propertyless society on the model of the Buddhist sangha In the immediate context, dalitbahujan movements and governments should focus their attention on drastically restructuring land reform laws so that the dalitbahujan are able to get land for cultivation and housing In order to strike at the roots of brahminical patriarchy, land rights must be given to dalitbahujan women on a priority basis Further, all those who have taxable incomes should be alienated from land ownership rights because the multi-source incomes of the brahminical upper castes are primarily responsible for increasing and sustaining their hegemony and control

The dalitbahujan masses particularly SCs and STs have no share in business, banking and financial capital at all The dalitbahujan movements must isolate the bania businessmen by encouraging the dalitbahujan youth to enter business Such a change in the market system requires a massive political campaign to educate the dalitbahujan masses because today philosophically and psychologically they do not see business as their task at all It is important to encourage them to form dalitbahujan syndicates and enter into banking and finance capital In order to de casteise private industry, the state must be forced to give licences only to the dalitbahujan to start new industries Higher educational institutions must be restructured to improve the productive skills of all masses

T Rajashekhar and Ram Nath made presentations on strategy and tactics of dalitbahujan movements Brahminical forces were adopting treacherous strategies and tactics to perpetuate caste oppression and the need to search for much more powerful dalitbahujan strategies and tactics to defeat brahminism was stressed

An organisation called the Dalitbahujan Intellectual Forum of India (DIFI) was formed By a majority vote it was agreed that the word 'dalitbahujan' (as one word) gives conceptual clarity for the emerging unity of the exploited and oppressed majority It was important to use the word 'intellectual' in the name of the organisation in view of the dalitbahujan being seen as having no intellectuality' Indian brahminism has played a more dangerous role than colonialism in destroying the people's intellectual base Brahminical intellectuality of all varieties must be buried and dalitbahujan productive intellectuality has to be promoted

POLICY changes in parliamentary democracies like India do not occur in direct response to popular critiques alone. The ruling classes have to make accommodation for numerous pressures, often contradictory, in a manner as to protect their own interests and consolidate their dominance over the political and economic system. This much has to be accepted as a constraint of the system. What is happening today, especially with regard to the social sector is even more demoralising than having to contend with a ruling class long grown complacent, obdurate and unmoving in the face of a weak challenge to its continued rule. Popular critiques of the government programme, grounded in the reality of the growing economic burden and social distress are being taken over, absorbed by international agencies and regurgitated as elements of a radical new prescription for the ills of the third world. Having taken control of the direction of economic development, it has now become necessary for international agencies to ensure that third world nations can deal with the 'social' problems and especially that the recipients of the proliferating economic goodies emerging remain limited in numbers. The World Bank's policy prescriptions on India's family planning programme is a typical case of taking the opposition by the horns, reining it in, and using it to propel changes in public programmes which will increase social distress in the long run.

It is not of course the first time that international agencies have sought to give direction to population policies. It was in fact at the prompting of western interests that India's family planning programme grew as it did in the late 1960s and up to the mid-1980s. Population targets have not been set in terms of what the country can afford, but according to notions of how much India can be permitted to contribute to the world's population. The choice of contraceptive methods introduced in the programme from time to time has been overwhelmingly led by funding agency requirements. Many of the grants-in-aid for the family planning programme, for instance, were partly in the form of supplies including contraceptives. There is considerable truth in the general opinion that most of the committees set up to review the family welfare programme or the country's population policy have been overwhelmingly influenced by international opinion overriding people's concerns. Even today a large proportion of the central expenditure on family welfare comes from international aid. The current World Bank report abandons the subtleties of earlier directions and sets about instructing the government of India, in no uncertain terms, to be, ironically enough, more people-oriented.

Why has the World Bank found it necessary to review the family planning/welfare programme at this particular juncture? By its own assessment, it is not as if the Indian programme is particularly unsuccessful. The report points out, for instance, that the programme has contributed greatly to the "health of mothers and children and providing family planning services"; that contraceptive prevalence is 40 per cent of eligible couples; that India has achieved 60 per cent of its goal of replacement fertility (2.1 births per woman), fertility having declined from 6 to 3.4 births per woman; the programme has been able to avert an estimated 168.8 million births in 1992 as against 44.2 million a decade ago. These are not mean achievements by standards the programme has itself set. The report also points out that the government of India has taken concrete steps towards reviewing and reorienting the family welfare programme, expanding the so-called maternal and child health component. So why has the Bank felt the need to undertake a review and make specific recommendations? One stated objective is to effect the transformation of the programme from family welfare to 'reproductive and child health'. But even this is not new; the reproductive health approach evolved in the late 1980s in response to the growing international awareness, particularly in the women's movement, of the devastating impact of west-directed and funded family planning programmes in third world countries and of the long-term and unacknowledged effects of many new and currently used contraceptives. Since then it has been systematically promoted not only by international agencies including the WHO, but by a section of the women's health movement who see in it the only available space for garnering significant gains for women's health. The Indian Council of Medical Research had in fact prepared extensive material on the strategy of introducing reproductive health, including cost considerations several years ago, and has made clear its objective of reconceptualising family welfare as reproductive health.

The significance of the report lies not so much in the policy recommendations that it makes on the components of the programme. These in summary are: (i) moving away from the method-specific contraceptive targets and incentives system; (ii) expanding the use of male contraceptive methods; and (iii) improving the breadth, availability and quality of services. These clearly are not of serious import, for they have already been implemented. The family welfare programme is already moving towards a 'client-centred approach' and has initiated, as the report concedes, "before the Cairo conference" discussions with "women's groups, NGOs and other experts regarding alternative performance goals". The ministry has already instructed the states to begin the process by eliminating targets in one district from April 1995. Improving the quality of services becomes imperative in the context of ground level

realities: for one, it is no longer possible to bring down fertility rates by resorting to terminal methods (which it has always been assumed, do not require follow up), two, tubectomies have always formed a major proportion of sterilisation indicating a failure of the programme to persuade men to opt for it and three the National Family Health Survey data are showing that a large proportion of women who need contraception are those who have completed their childbearing but are too young (or too aware of the ensuing problems) to opt for sterilisation (that is if they are given a choice) Given this the target groups will remain women in the younger age group So while making gestures towards introducing male methods the stress has to continue to be on long term spacing methods This inevitably means that availability and quality of services become important The suggestion for including male methods is really a peg for suggesting the broadening of contraceptive choice by, as the report strongly recommends including highly controversial injectable like Depo Provera No mention is made of the substantial well documented worldwide opposition to it

How is all this to be achieved? (i) By strengthening the role of the private sector in FWP and (ii) assuming adequate funding for the current programme and future expansion It is this which reveals the intentions of the report The document is emphatic in its concern for what it terms the extremely poor public spending on family welfare It points out that the annual allocation for FWP is about Rs 19 per capita per year less than in many developing countries In fact it [India] spends less on maternal and child health and family planning than the Rs 28 recommended for family planning alone by the World Bank's 1993 *World Development Report* In order to help India achieve the required spending the report identifies various gaps in service and infrastructure and proposes two scenarios for priority spending one filling staffing gaps creating new subcentres, upgrading referral particularly for obstetric care and providing transport two all of this plus creating new PHCs In addition of course is the suggestion to involve and strengthen links with the private sector

The fact that the family planning programme has dominated the health care set up both administratively as well as in financial terms appears to have quite escaped attention Nor for that matter, is the fact that health expenditure on public health has been progressively going down acknowledged The *WDR 1993* recommendations on spending was it must be remembered, based on the assumption that significant health and medicare services would be privatised, with the public sector focusing on the most cost effective' interventions In sum the review of the family welfare programme and the recommendations is a single-minded attempt to sell the World Bank's prescriptions for health privatise medicare, focus on 'essential care', progressively push the state into jettisoning health care responsibilities and give high priority to reducing numbers paying sufficient lip-service to sensitive issues such as health care for women The fact that the prescriptions are as uncaring about women's needs viewing as they do women narrowly only as reproductive beings, should not of course come as a surprise After all it is through the use of such 'people oriented' packaging that the new goods of a transforming economy can be sold

WORLD ECONOMY

Lessons of 1994

THERE was a sharp expansion of economic activity in all the regions of the world in 1994 the industrial and developing countries alike according to the annual report of the Bank for International Settlements (BIS) for 1994 95 Real GDP of industrial countries grew by 3 per cent on average against 1 1 per cent in 1993 Particularly impressive was the growth of the developing countries with output rising by 6 per cent While the Asian continent has been in the forefront of growth for the past decade and a half it is the emergence of Latin America Africa and even eastern Europe on the growth map that was most striking Growth in Latin America rose from 1 8 per cent per annum during 1982 1991 to 3 per cent in 1993 and further to 4 5 per cent last year while the Asian developing countries recorded their third successive year of growth of over 8 per cent compared to an average of 7 per cent per annum during 1982 91 Countries with growth rates above the regional average were China (11 8 per cent in 1994 against 13 4 per cent in 1993 and 9 3 per cent during 1982 91), South Korea (8 4 per cent against 5 8 per cent and 9 5 per cent) Thailand (8 5 per cent against 8 2 per cent and 8 1 per cent), Malaysia (8 7 per cent against 8 3 per cent and 6 1 per cent) and Singapore (10 1 per cent same as in 1993 and 6 8 per cent during 1982 91) In Africa there was a modest growth of 2 3 per cent in 1994 compared with 0 4 per cent in each of the preceding two years and 2 5 per cent per annum during 1982 91 Amongst the economies in transition however, only those in eastern Europe showed positive growth in 1994 – compared to -1 8 per cent per annum during 1982 91 6 7 per cent in 1992 and -2 2 per cent in 1993 The Russian Federation and Ukraine continued to experience massive output losses ranging from 12 per cent to -19 per cent and from -17 per cent to -23 per cent respectively, in the past three years However, studies apparently not noted by the BIS have shown how conventional measures tend to overestimate the decline in production in the Russian Federation due to [illegible] factors as the rise of production in the defence industries.

All the same, the world economic recovery in 1994 had a tenuous quality about it because it was essentially export-led The progressive internationalisation of economic activity reached a high pitch last year when the volume of merchandise trade grew by 9 per cent that is, more rapidly than for nearly 20 years The generalised trade liberalisation, increased trade within trade blocks and relocation of production across national borders by multinational corporations provided the impetus for growth of trade in 1994 Dependence on trade has also made world economic growth desynchronous In the current cycle the major European economies lag behind the US by more than six quarters compared with an average lag of one to two quarters in the 1970s and early 1980s Continued growth in the US and the south east Asian countries provided the foundation for the export led recovery in most of Europe in 1994 US expansion gave the impetus to Latin American growth, while western Europe helped a number of east European countries to register positive growth for the first time after the collapse of their communist regimes The African continent benefited from the pick up in world demand and the rise in commodity prices

There are however serious misgivings about the sustainability of the high growth of 1994 The US growth of 4 1 per cent the highest in a decade is believed to have peaked While US exports grew by 9 per cent underpinned by the continued weakness of the dollar they were outpaced by the rise in imports by 13 4 per cent The restraint on inflation is also wearing thin The rapid rise in exports have substantially raised capacity utilisation rates in the US and several other countries and inflationary pressures are raising their head in the manufacturing sector in these countries The phase of low rise in nominal wages has come to an end, particularly in the European countries despite high rates of unemployment The US remains an exception in that nominal wages have remained subdued in spite of relatively low unemployment and high capacity utilisation Growth of part time and piece rated employment has been responsible for the unusually low rise of 2 2 per cent per annum in nominal wages in the US during 1990-93 against increases ranging from 4 to 5 per cent per annum in Japan Germany and the UK However, the concerted attempts at the OECD and the European Community level to achieve labour market flexibility brought unit labour costs down in 1994 not only in the US (–1 9 per cent) but also in Japan (–0 4 per cent), Germany (–6 1 per cent) and the UK (–0 1 per cent) Currency depreciation in a number of countries other than Germany and Japan has also helped manufacturing firms to reduce real producer wages which, combined with faster productivity growth, has improved profit margins

There has been heavy labour-shedding in the manufacturing sector in the industrial countries. For these countries as a group, the average rate of unemployment was 7.3 per cent during 1983-92 which rose to 8.1 per cent in 1993 and 8 per cent in 1994 and in the first quarter of 1995 was only marginally lower at 7.7 per cent. The BIS annual report tries to play down fears of a jobless economic recovery as being exaggerated, pointing to some countries outside Europe where unemployment rates have declined rapidly. Nevertheless it acknowledges serious structural problems on the employment front. First, whatever fall in the unemployment rate there has been in some countries like the UK has occurred not so much due to rise in employment as decrease in the proportion of the population offering itself for employment reflecting demographic factors as well as a 'discouraged worker' effect. Second, there has been over the past 20 years a ratchet effect in every business cycle raising the rate of structural or long-term unemployment. The BIS report's explanation of these developments runs on very conventional lines: relatively high unemployment benefits, loss of skills during periods of unemployment, strength of unions and labour market regulations on hiring and firing etc. These factors have, according to the report, resulted in a rise in what has come to be known as the non-accelerating inflation rate of unemployment (NAIRU), a corollary of the rigid anti-inflationary stance of macro-economic policy in the industrialised countries. Also, with the increasing dominance of financial transactions, the recessionary phase gets elongated in certain sectors as low inflation results in asset price deflation and large non-performing assets. The BIS report cites the cases of countries such as the UK, Canada, Italy, Finland, Sweden and Spain which have combined in the current business cycle a vibrant manufacturing sector with a service sector that is still subdued after its earlier excesses. The BIS report draws attention to a number of structural problems which could bring recovery in some countries to an early end while delaying it in countries which are lagging behind in the cycle, particularly when export demand slows down. Among these are the negligible or nil growth in household income and purchasing power, particularly in western Europe as a result of stubbornly high unemployment rates, rising debt service charges and persistent government deficits, decline in saving rates and sharp rise in long-term interest rates adversely affecting both non-residential investment and investment in interest sensitive residential property.

As for the developing countries, their general favourable picture was clouded by unprecedented interest rate and exchange rate fluctuations followed by recurrent financial market turbulence. The so-called emerging markets felt, in varying degrees, the fall-out of interest rate increases by the US, rapid depreciation of the dollar *vis-a-vis* the yen and the deutsche mark and much more powerfully the liquidity crisis in Mexico.

What marks out this report of the BIS from earlier ones is the cautious note it strikes on financial sector reform. The turbulence that the financial markets went through in the wake of the Mexican crisis in late 1994 and early 1995 has cast its shadow on the report. On the Mexican crisis itself the report is wishy-washy about what went wrong, though enough is said to underscore the lack of wisdom of the radical stabilisation policies launched in the late 1980s. Maintenance of the exchange rate as a nominal anchor, freeing of capital flows, substantial appreciation of the peso's real exchange rate, unsuitability of the dollar as an anchor for tight monetary control, phenomenal increases in bank credit following banks' new found freedom particularly for consumption purposes, drastic fall in private saving rate, replacement of peso denominated government debt by short-term dollar linked securities (tesobonos) and large dollar dominated borrowing by the banks – all contributed to the fragility of Mexico's financial system so that when the crunch came in the form of the Chiapas rebellion there was a run on the currency and the country's much vaunted reserves evaporated into thin air.

The Mexican episode has induced the BIS to deal with the world financial system itself in some length but the final position it takes is an ambivalent one – as it is only to be expected of a body controlled by the central banks of the G-10 countries. Though it brings out the systemic risks inherent in market participants trading 'larger amounts more frequently through highly leveraged positions in a greater number of markets and across a larger set of national borders', the BIS views the emerging situation as undoubtedly of great benefit. However, the data that the BIS report itself provides and the specific observations it makes on the implications of the turbulence in the financial markets are at sharp variance with this rosy view. First, the report acknowledges that the risks of financial sector reform had been amply exposed by the deregulation of the 1980s in the industrial countries including those with well-established financial markets and institutions. Almost everywhere a surge in credit resulted and ultimately debilitated parts of the banking system. Alongside there was 'excessive real estate trading, asset price inflation and in some cases, loss of monetary control'. Second, interest rates tended to rise and also to fluctuate more violently after financial liberalisation. Third, by opening the financial markets to foreign influences, financial liberalisation increased the vulnerability of the economies and the domestic financial markets to disturbances originating abroad and to changes in sentiment in foreign capital markets. Finally, financial liberalisation has also adversely affected government finance. As demonstrated by the Mexican crisis, large increases in domestic interest rates can lead to a bulging of the budget deficit. This experience should drive home the lesson that before financial markets are liberalised and opened up by developing countries, India included, a sound current account on balance of payments, a level of domestic saving high enough to meet the investment needs of rapid and orderly development and reasonable fiscal balance must be ensured. In any case, the reforms have to be gradual and carefully sequenced.

The BIS report presents telling statistics on the turbulence in bond markets and on capital flows into the developing countries. The turbulence in bonds market in early 1994 following the tightening of monetary policy by the US Federal Reserve in early February marked a sharp reversal of fortunes with an unexpected surge in bond yields almost everywhere. The flow of portfolio investment into the emerging markets from the industrialised countries dried up. Also exploded, the BIS admits, was the long cherished hope that low inflation and a rigid commitment to anti-inflationary policies will make for stable yields on bonds and equities. Huge cross-border transactions and enormous use of leverage permitted at the margin are inherently vulnerable to developments such as the Fed actions and the Mexican crisis. The rise in bond yields the BIS report brings out resulted in some of the largest portfolio losses in the post-war period, put at the order of $1.5 trillion, equivalent to almost 10 per cent of the GDP of the OECD countries, and severely destabilised equity markets both in developed and developing economies. Among the factors responsible for the extraordinary volatility in bond prices two stand out: (1) heightened uncertainty about the economic environment generally, notably inflation, output growth and monetary policy and (2) globalisation of financial dealings as a result of which developments in the US rapidly spilled over into other markets.

Developments in 1994 are significant also in respect of capital flows into the emerging markets. It was confidently expected that there would be a massive influx of foreign capital into these markets once the governments of these countries carried out policy reforms such as trade liberalisation, deregulation, privatisation of the domestic economy, freeing of the financial markets and instituting controls on foreign investment. However, what the experience of 1994 marked by stagnation of net capital inflows into Asian countries and a drastic fall in inflows into and even capital exodus from the Latin American countries, underscores is that capital flows

are decisively influenced by external factors, such as interest rates and cyclical conditions in the industrial world over which the LDCs have no control

MAHARASHTRA

Watery Thoughts

THE Maharashtra government says it has decided to give top priority to solving the drinking water shortage in the state The decision to create a separate ministry to deal with the subject has been announced The government has also issued a white paper which proclaims the government s resolve to end the present pro-urban bias in the distribution of drinking water Excess water from major irrigation projects like Jayakwadi in Marathwada and Ujni in western Maharashtra is proposed to be released to meet rural drinking water needs The government has also decided to do away with the condition that municipal water supply schemes must raise 10 per cent of their cost by way of public contribution because of which many such schemes remain pending Instead the government will provide the amount as loan According to the white paper the state government proposes to spend Rs 6 700 crore over the next five years on solving the drinking water problem in about 40 000 villages

While water supply is a vital issue in Maharashtra s socio economic development the white paper is mainly concerned with administrative bottlenecks in the implementation of water supply schemes Thus besides promising harsh steps against corruption in the field and stressing the need to improve the efficiency of existing schemes the document mentions few other measures to conserve the state s scarce water resources There has been no perceptible change in past few decades in the annual rainfall the state receives and yet the state has been facing a recurrent problem of drought indicating serious deficiencies in water distribution and utilisation policies The white paper proposes a compulsory levy on industrial units which pollute water sources but is silent on the state s lop sided cash crop biased cropping pattern The problems of the Konkan region which receives the most rainfall in the state but faces severe water shortage in summer also go unmentioned

A major gap in the white paper is the absence of reference to the need to increase the forest cover in the state so as to replenish water sources in the long term The forest cover in many parts of the state is extremely scanty It is just 0 4 per cent of the total land area in Osmanabad district In Latur and Ratnagiri districts it does not go beyond 1 per cent while in 10 other districts it is not more than 5 per cent In the absence of adequate forest cover the water table has been receding and cases of bore-wells having to be sunk to depths of 500 metres have been reported

The white paper talks of the importance of inculcating in people sound health and hygiene practices so as to keep drinking water clean, but leaves untouched the issue of how this is to be done Most importantly, it has very little to say on what the government intends to do to generate people's participation on an issue which is of intimate concern to them The involvement of NGOs is sought, but the emphasis seems to be more on privatisation of water supply schemes And on the crucial issue of decentralisation of water management the white paper has few measures to suggest

SRI LANKA

Advantage Colombo

THE resolution of the continuing conflict in the north east was a major issue in the elections last year which saw Chandrika Kumaratunga become prime minister and later, president of Sri Lanka And certainly she has done more towards tackling the Tamil problem as well as addressing the demands of the LTTE in these months than others before her Each of her initiatives has expanded the ground for dialogue and the emergence of a solution The lifting of the embargo on the movement of selected everyday goods and consumption articles early on gained much ground for Colombo and forced the LTTE to come to the discussion table Similarly the cease fire and the proposal to have an international team to monitor it were so effected that the LTTE could not reject them out of hand but did so nevertheless on the ground of choice of participants in the international group The unilateral opening of the pass facilitating movement to and from the north east for the first time in long years was again a measure directed at building the confidence of the people in the government The failure of these efforts to make much real headway towards resolving the conflict has been partly because of the internal problems of the government - differences between the government and the military authorities but mostly the result of the LTTE's obduracy One thing however is clear Kumaratunga's efforts have expanded the format of conflict-resolution by attempting to go beyond the immediate concerns of the military engagement

Her latest proposals, the most sweeping so far not merely make special concessions to the northern and eastern regions, but are directed at transforming Sri Lanka from a unitary to a federal system enlarging on the changes that the India-Sri Lanka accord had proposed The existing provincial council system is to be replaced by regional councils with exclusive executive jurisdiction Every council will have a chief minister elected for a five-year term, with a governor to appointed by the president in consultation with the chief minister Executive powers are to be divided between centre and the regions and with no 'concurrent list' The centre will retain control over defence, foreign affairs, national security, currency, monetary policy, airports, etc, while the regional councils will have control over education, local government, housing and construction, agriculture, health, industries and fisheries The regional councils will have a separate police force headed by a regional police commissioner, but there will also be a national police The regional councils will have the power to set up their own financial institutions and even seek foreign loans

These changes are to apply to all regions and not only to the north and the east Politically, this is the crucial feature of the package On the one hand, the Kumaratunga government is making it clear that it recognises the real problems of the regions, especially the north and the east but on the other, it is also underlining the fact that the Tamil areas are as much a part of the country as any other In other words, the attempt is to resolve the fundamental problems which have over the years provided the base for the political movement for an eelam The government is sending out a clear signal that a separate Tamil homeland is an unacceptable proposition

It is not surprising that the LTTE has rejected the proposals although several Tamil parties in parliament have welcomed the package The advantage appears to be with Colombo now This is perhaps the most comprehensive proposals which have been put forward by the government in all these years with greater appreciation of the need for regional autonomy than ever before Moreover for a drained economy such as Sri Lanka's it is an alternative which seeks to distribute the burden of administration of a multi-ethnic state to its components This also addresses an issue which will undoubtedly come up in future – Sinhala resentment of concessions' to the north east By devolving powers to all regions, the Sinhala-dominated regions have also been given the power to redraw the contours of development according to their own priorities

These facts will not be missed, either internationally or nationally The LTTE appears to have been driven into a corner at least on the diplomatic front, though it is fairly clear that militarily there is little that the Sri Lankan army can do to counter it What is not clear so far is how the army has responded to the moves In the past and even recently, the Sri Lankan army has opposed moves which may proffer an advantage to the LTTE Any attempt to persuade the LTTE to consider the new proposals by, say, withdrawing the army from strategic areas or calling off the operations now in progress, will hardly be accepted gracefully

CENTURY TEXTILES

Thrust on Exports

CENTURY TEXTILES AND INDUSTRIES a BK Birla group company with diversified interests in textiles rayon, tyrecord, chemicals, shipping, cement and paper and pulp, has posted a 17 per cent increase in turnover, from Rs 1,182 crore to Rs 1,386 for the financial year ended March 1995 Other income has risen from Rs 50 crore to Rs 70 crore a rise of 39 per cent Gross profit has risen by 19 8 per cent but a faster rise of around 56 per cent has been recorded in net profit as a result of a very small tax provision and lower growth in depreciation The directors have proposed a dividend of 55 per cent against 47 per cent for the previous year

According to the company s management the cement division contributed roughly 33 per cent to turnover in 1994 95 riding on a bouyant cement market An average rise of about 12 per cent in cement prices in 1994 95 (against a fall of 1 per cent in the previous year) made a major contribution to the higher turnover The textiles division which includes cloth and rayon yarn contributed about 50 per cent to turnover and the paper and pulp division about 11 per cent The rise in prices of cotton in the last financial year is expected to continue to adversely affect the performance of the textiles division in the current year

The cement division comprises three plants namely Century Maihar and Manikgarh Century Cement is expanding its clinker capacity by 2 lakh tonnes by installing a precalcinator system in the kiln The expanded capacity is expected to go on stream by the end of 1996 The company has become one of the largest cement producers in the country with the commissioning of a one million tonnes unit at Maihar in Madhya Pradesh With this the company s total cement production capacity has gone up to 4 7 million tonnes per annum Upgradation of the Manikgarh cement plant is also in progress with the full benefits being expected by the year end Manikgarh Cement is increasing its capacity by 2 lakh tonnes to 12 lakh tonnes The expanded capacity is expected to be commissioned by the first quarter of 1996 Installation of captive thermal power plants of 15 MW each at the Century and Maihar cement units is being considered The company is consolidating its position further by large-scale diversification into manufacture of pig iron and paper and pulp It is exploring the possibility of setting up a 3 lakh tonne pig iron project in West Bengal at a cost of Rs 400 crore and two new pulp and paper projects in Punjab The Rs 900 crore paper project envisages setting up of facilities to manufacture 400 tpd of printing paper

The shipping division is being modernised with the purchase last year of a modern bulk carrier of about 44 000 DWT built in South Korea, taking the company's total fleet 11 aggregating about 3 16 lakh DWT The company has invested $ 55 million in two ships bought this year Dry bulk freight rates which had started rising from last year have stabilised at good levels and are expected to remain there

In spite of the unprecedented rise in cotton prices exports by the company s textile division were Rs 241 crore Total exports by the company increased by 35 per cent from Rs 215 crore in 1993 94 to Rs 290 crore in 1994 95 Simultaneously, the company s imports and foreign exchange outgo in other forms have galloped in the past two years from Rs 29 crore to Rs 191 crore With the modernisation of the paper machines the company is set to export paper Exports of various qualities of paper is already taking place to many countries in south east Asia

The company has phased out the use of harmful dyes and its R and D department has developed alternative shades to replace the banned dyes Plans for a new 5 000 tonne viscose filament yarn (VFY) unit in Gujarat near Grasim s upcoming 60 000 tonne viscose staple fibre plant have been shelved for the time being with unfavourable market conditions and continued rise in raw material prices being cited as the reasons The decision to locate the plant near Grasim s project was based on the possibility of procuring raw materials like caustic soda and carbon disulphide from the latter In keeping with plans to modernise and expand its fabric making capacity the company plans to replace its conventional automotive looms with modern airjet looms which are said to increase fabric making capacity by nearly four times The company is planning to double spindleage capacity of Century Yarn its cotton yarn EOU The expansion is estimated to cost Rs 50 crore and will be complete in one year Among other plans on the anvil is the setting up of a denim EOU with an annual capacity of 10 million metres at an estimated cost of Rs 100 crore at Satrati in Madhya Pradesh The company is also venturing into floriculture for roses, again for export

The company tapped the international market in 1994 with a Rs 314 crore GDR issue to finance its expansion programmes, mainly for doubling the cement capacity at Raipur (Rs 110 crore) and installation of power plants for captive use (Rs 145 crore)

LLOYDS STEEL INDUSTRILS

Backward Integration

Lloyds Steel Industries the flagship company of the Lloyds group operating in the core areas of engineering and steel closed its financial year ending March 1995 on a buoyant note Total income jumped up from Rs 113 89 crore to Rs 463 52 crore a rise of 307 per cent After depreciation provision of Rs 17 52 crore against Rs 3 29 crore for the preceding year net profit stood at Rs 70 48 crore up by 77 6 per cent from Rs 39 69 crore posted in the previous year The boost to the bottomline was provided by the commissioning of the company s hot rolled coils project at Wardha though the company claims that the full effect of the project will be reflected only in the current year s working A dividend of 25 per cent has been recommended by the directors

The turnover from the engineering division stood at Rs 202 87 crore up 81 per cent from Rs 112 31 crore in the previous year Production achieved by the steel division since the commissioning of the HR coil project in October 1994 touched 1 44 527 MT

The company s future plans focus on backward integration and diversification Lloyds Steel is to commission its first cold-rolling mill this year to produce 1 50 lakh tonnes of cold rolled sheets The second cold rolled mill is also expected to go on stream by the end of the year adding another two lakh tonnes to capacity Lloyds also has plans to invest in additional Rs 15 crore for equipment to produce in addition one lakh tonnes of discrete plate which will raise the capacity to 7 lakh tonnes Lloyds Metals and Engineering the company s engineering division is setting up a coal fired 1 50 lakh tonne sponge iron plant about 100 km from the site of the steel plant The sponge iron produced at the plant will be the principal raw material for Lloyds Steel conferring the benefits of backward integration on the company Lloyds vice chairman Mukesh Gupta foresees a cut in production cost to the tune of Rs 3 000 per tonne once the project goes on stream Further, the company is to set up a 40 MW power plant using waste gases generated in the sponge iron process In house capability to supply critical equipment and put up an engineering kiln will it is claimed reduce the cost of the project from the normal Rs 190 crore to Rs [illegible] crore

The engineering division has also commissioned the first of its desalter plants for the ONGC at Nawagam Gujarat The Rs 4 crore order the second major one after the project for the Madras Refineries in 1993 involves designing engineering

(Rs lakh)

manufacturing and assembling three units of desalters which according to N V Bhatt, general manager marketing and business development is the largest desalter installation of its kind in India [with] a capacity of desalting 2 55 000 kg per hour

Also on the cards is a Rs 700 crore entry into mining of iron ore and coal in Gadchiroli Maharashtra with minimum capacities of 10 lakh tonnes each with a possible tie up for technical support with a world mining major such as Cleveland Cliffs of the US ISCOR Pretoria of South Africa Companhia Vale Do Roidoce of Brazil or Hammersely Iron of Australia The arrangement is to be only in the form of a technical tie up with no equity participation by the foreign company

With the aim of jointly taking up turnkey projects Lloyds Steel plans to enter into an alliance with Spic given the latter's expertise in executing contracts both in the domestic and overseas markets Further according to Mukesh Gupta the company's excellent workshop facilities would be better exploited by entering into this alliance The group is also interested in diversifying into areas like software pharmaceuticals pesticides and driving with an investment of Rs 10 to Rs 40 crore

Lloyds Steel has recently concluded an order for Rs 2 crore from Sembawang Projects Engineering Singapore for a hydrogen peroxide project being built in Indonesia It has tied up with Suerdohibau GmbH Germany to offer a gamut of services in the area of pipeline construction ranging from feasibility and economic studies to construction management and operation and maintenance

To part finance the various projects a rights issue of Rs 700 crore has been planned Earlier the company had planned to come up with a $ 50 million GDR issue but the plan has been shelved in view of the depressed market conditions

The cancellation of the Enron project at Dabhol may adversely affect Lloyds Vittol Petroleum a joint venture between Lloyds Steel and Singapore based Vittol Lloyds was hoping to use the fuel jetty to have been built by Enron The along with the hike in international prices and slow process of removal of subsidies by the government have temporarily stalled the project which is based at Ratnagiri The memorandum of understanding between the two companies was for marketing liquefied natural gas supplied by Vittol

NOCIL

Ambitious Expansion

NOCIL the flagship company of Arvind Mafatlal has recorded a modest rise of 14 per cent in net sales in the year ended March 1995 from Rs 822 crore to Rs 936 crore

Other income increased from Rs 43 crore to Rs 46 crore. After providing Rs 14.69 crore for depreciation and Rs 35 crore for taxation, net profit was Rs 74.77 crore. Exports increased from Rs 67.77 crore to Rs 81.11 crore. The directors have recommended a dividend of 45 per cent against 40 per cent for the previous year. A bonus issue has also been recommended to reward shareholders keeping an eye on the large capital raising programme to be undertaken by the company over the next three years. The bonus issue will result in the capitalisation of reserves to the extent of Rs 61.30 crore. According to analysts the bonus issue is being offered as a sop to investors whose returns may be diluted following the massive expansion in the company's equity following the projected rights cum public issues.

The petrochemicals giant hopes to achieve an export turnover of Rs 100 crore next year according to N M Dhuldhoya, vice chairman and managing director, having chosen exports as one of the thrust areas. NOCIL achieved an export turnover of Rs 80 crore in the year under review. The company is engaged in the export of pvc, rubber chemicals, industrial solvents and various other specialty chemicals to the Far East, the Gulf and west Asia. Besides its own products which constitute 70 per cent of total exports, the company plans to increase the volume of merchant exports. A part of its efforts to step up exports involve upgrading the quality management system. NOCIL has received ISO 9002 certification for adopting quality management systems in the manufacture and supply of its petrochemicals. NOCIL has also been honoured with the British Safety Council's Sword of Honour Award thrice in four years.

The company is planning to come up with a public cum rights issue of Rs 4.362 crore, the biggest by an Indian corporate enterprise. It is going in for massive expansion cum-modernisation of its petrochemicals complex at Thane. The project cost is proposed to be financed through a Rs 1.563 crore rights issue of partly convertible debentures, a public issue of partly convertible debentures of Rs 2.010 crore and foreign investment of Rs 1.059 crore. The expansion will increase ethylene capacity from 75,000 tonnes per annum to 3.20 lakh tonnes. Propylene capacity is being raised from 40,000 tonnes to 2.25 lakh tonnes. Besides, plans are afoot to create fresh capacity to manufacture 1.8 lakh tonnes polypropylene, 2.1 lakh tonnes polythene and 86,000 toluene/xylene. Technological tie-ups with international companies including KTI of Holland, Technip of France, Buss of Switzerland and Himond of Italy have already been concluded. The project is scheduled to be operational in late 1998 and preparation of process design and basic engineering packages for the cracker plant and utilities centre has commenced from January this year. The International Finance Corporation (IFC) has approved the scheme and will arrange for the $ 350 million foreign exchange component of the project in exchange for a small equity in the project, according to the vice chairman and managing director.

NOCIL is also expanding its polyvinyl chloride plant to economic size. The company had earlier decided to phase out its PVC unit but the firming up of international prices for polymers has prompted it to reverse the decision. Indigenously manufactured PVC will be cheaper and NOCIL is now looking for technical collaboration to upgrade its almost three decades old plant.

The Arvind Mafatlal group is setting up a joint venture with Dow Chemicals. The agrochemicals division of NOCIL is proposed to be handed over to the new company, Dow Nocil Agrochemicals, in which Dow Chemicals and the Mafatlals will each hold [illegible] per cent of the equity. Technology for [illegible] products including [illegible] insecticides is [illegible] brought in by the Chemicals. The Mafatlal Dow combine is expected to face competition from Hoechst, another leading player in the field.

The company's range of petrochemicals includes solvents, alcohol products, ethylene oxide, glycols and PVC shoe compounds. The company [illegible] marketing vinyl sulphone and polypropylene fibers.

SHREE CEMENT

Improved Performance

Despite continuing recessionary conditions as a result of reduced offtake of cement by government agencies, Shree Cement, the Bangur group company, showed much improved performance in the year ended March 31. Turnover rose to Rs 158.80 crore from Rs 127.70 crore in the previous year, an increase of 24 per cent. Profit before tax increased by 61 per cent to Rs 47.10 crore from Rs 29.30 crore. Net profit was up by almost 91 per cent from Rs 11.76 crore to Rs 22.30 crore. A dividend of 20 per cent has been declared by the directors.

The company produced 893,201 mt of clinker against 858,326 mt in the previous year. It achieved 102 per cent capacity utilisation in the year under review, producing 927,283 mt of cement. The conversion of railway tracks from meter gauge to broad gauge in the Delhi-Ahmedabad section has expanded the company's access to the market connected with broad gauge lines.

The company is setting up a Rs 200 crore power plant in Rajasthan as a joint venture with Deutsche Babcock of Germany, with both partners contributing equally to the project cost. Funds for the project are to be raised through internal accruals and term loans without taking recourse to the capital market. Most of the power from this plant will be consumed by Shree Cement's own unit at Beawar in Rajasthan.

The company has drawn up an investment plan of Rs 700 crore to increase its manufacturing capacity over the next four years. The plan has been divided into two phases and the first phase is well under way. The company is setting up a plant at Ras in Jodhpur. In the second phase the capacity of the Ras plant will be increased by one million tonne. The first phase is estimated to cost Rs 400 crore, out of which Rs 45 crore will be put in by the Bangurs with the balance coming from fresh equity issue and term loan. The funding pattern for the second phase is yet to be finalised. The company had nearly finalised a deal with foreign institutional investors, equity linked debentures of Rs 46 crore in the month of [illegible]. However, [illegible] the [illegible] and [illegible] to [illegible] remain [illegible] [illegible] company [illegible] [illegible] on [illegible] [illegible] the company [illegible] [illegible] [illegible]

While the annual rate of inflation has continued its downward trend to touch 7.6 per cent the general index of wholesale prices has risen to 292.8 from 290.9 a month ago. The sharpest rise of 1.7 per cent was recorded in the index for non-food articles. The government's recourse to ad hoc treasury bills had touched the phenomenal level of Rs 16,660 crore in July and Rs 16,065 crore in July 14 overshooting by far the Rs 9,000 crore limit. Reflecting easy and improvement in liquidity call rates have eased and so has the gilt edged market for other instruments. In primary the rate as the yield on 364 days which had been firming up in recent weeks have edged down slightly. Forward premia for the dollar have come down as has the dollar rate which has dipped below Rs 35 for the first time in recent months.

Rabindric Fundamentalism

GPD

We will condemn even a remotely disapproving remark about Rabindranath Tagore as blasphemous while merrily naming chairs in our universities after foreign prime ministers. Surely, Calcutta could have done better than that.

THERE is a sizeable class of people in absolute numbers though not as a proportion of the total population which uses understands or misunderstands English in our country. It is this class which probably recognises either the Advaita Languages or English as the only Indian languages. Going by the remark made at a recent seminar in Delhi by Hindiwallahs have invented the myth of this class. One of them in fact asserted that it was a matter of good fortune (saubhagya was the word used) that Maharashtra and Gujarat were now Hindi speaking! Not being particularly good either in English or Rashtrabhasha Hindi we have tended to ignore these claims on the plea that we do not understand them. But then we had hoped that the great Indian writers in English would leave the dalit and OBC languages like Marathi and Bengali alone. One does not any longer mind that this English elite wakes up to the fact that Roshan Seth is a good actor because he performs in London and with some European actress. One does not mind that Naseeruddin Shah's credentials as an actor are finally going to be established when he plays the lead part in a French play translated into English in London. As Shombhu Mitra or a Shreeram Lagoo or a Tripti Mitra or a Sulabha Deshpande may spend all their lives doing theatre in the dalit languages but the DD and our so called national dailies would have little or no space for them. The only saving grace in the situation so far was that they had left people working in minor third world languages alone. They made their pounds and dollars and there the matter stood. It involved mutual non recognition and it was to everybody's good or so one had thought.

There is an Indo Anglian author called Khushwant Singh. We have not read any work by him and therefore cannot say what kind of author he happens to be. If he happens to be the same person whose column appears in every other newspaper then we can claim some knowledge of his authorial capabilities but obviously not enough to pass any judgment. What is curious is that this author who has never used any Indian language (apart from English that is) for his creative enterprises should suddenly choose to make comments on Rabindranath Tagore. He probably did that to raise a storm. We are tempted to believe that now that a storm has actually been raised, he is privately enjoying it. The question still remains however as to why these Indo Anglian writers do not leave the minor languages and literatures of India alone. An idea could be floated that all native writers (or as many of them as possible) give it in writing that they subscribe to the view that the Shobha Des and the Khushwant Singhs (or any other writer) of the Indo Anglian world are far greater than Tagore, Jibanananda Das, Ketkar, Tukaram and the like. Maybe then they would leave us alone.

The tendency to take the natives lightly cannot be much of a surprise in the post colonial world where the colonised mind still reigns supreme. Not so long ago a Bombay paper carried an article on Shivaji and the Queen of Jhansi by an Indo Anglian journalist. Normally anywhere in the world personalities of the 17th and 19th centuries would be the concern of historians. But these rules do not apply to those in English journalism or so it would seem. There was predictably a storm. The issue was this journalist's freedom of expression. There was in fact a meeting in Delhi which we had the misfortune to attend. We had defended Pandharinath Ranade's right to say what he did on Shivaji (which had also created a storm then) because a historian has a right to hold a view favourable or unfavourable, on Shivaji. We did not see how a young graduate in English literature could make bold to speak on a subject which she should not have been speaking on. She even cited a Marathi book of the 19th century. There was a critical article in a Bombay Marathi daily questioning her use/understanding of the text. But our notion of democratic rights does not necessarily cover academic responsibility certainly not towards material in a native language! Bengali's case is slightly different one reckons, as that language has at least one Nobel prize. This might explain why the journalists and intellectuals who were keen to defend Adjania's (the author we have been talking about) right to freedom of expression did not come out in defence of Khushwant Singh's right to freedom of expression! This is so in spite of the fact that the Maharashtra assembly did not pass a resolution against Adjania while the West Bengal assembly has against Khushwant Singh.

One would have thought that the Bengali elite was the most advanced of the Indian elites. (Before our English-speaking elite object, let us clarify that we mean elites belonging to the native or better still the vernacular languages. We dare not say one word against those who [illegible] speak and read English. And, more importantly, even if we did, it would not matter really.) As such the Bengali elite would ordinarily take comments on Rabindranath Tagore in its stride. But they have reacted to what Khushwant Singh has said in much the same manner as Islamic fundamentalists have reacted against Alavi recently or against Salman Rushdie. Are we witness to some kind of Rabindric fundamentalism? One can easily see that many would take even a remotely disapproving remark against Tagore as blasphemous. But an author (even an Indo-Anglian one) has a right to say what he thinks of another author. In fact the liberty should extend to all artists generally. Shaw did not think much of Shakespeare. Nor did Rex Harrison either of Shakespeare or of Stanislavsky. While Khushwant Singh is no Shaw or Harrison, the important thing is that neither the British nor the Russians were unduly perturbed by scepticism about Shakespeare's or Stanislavsky's standing. One is, therefore, required to conclude that it is Rabindra fundamentalism which is causing this furore.

This becomes all the more apparent when one notices that Bengal politicians and the Bengali elite were not upset when a chair in economics was sought to be instituted in Calcutta University in the name, of all persons, of the prime minister of Singapore! The only objection raised by the university syndicate members was that the Rs 15 lakh offered for the purpose was not acceptable. At least Rs 25 lakh should have been offered, argued the syndicate members. If the countries of west Asia and Pakistan are any guide, fundamentalist' critiques of 'western' societies do not extend to money or arms. Much the same is the case with cultural fundamentalism. We will condemn criticism of our cultural icons and we will merrily name our academic chairs after foreign prime ministers! Surely, Calcutta could have done better than this. One had hoped that it would have. Meanwhile Khushwant Singh and Goh Chok Tong (the Singapore prime minister) are probably having a hearty laugh as the bhadralok wallow in their Rabindric fundamentalism.

NEW DELHI

Enron and the High Cost of MNCs

B M

The Enron episode has brought out the high cost to the country not of just this particular deal had it gone through, but of the open door policy towards multinational corporations which is such a vital part of the government's economic reform policies. It is from this wider standpoint that the Enron case must be debated in the country.

THE scrapping of the Enron deal has been warmly applauded by public opinion. All the opposition parties regardless of their ideological and political differences have supported the decision of the BJP-Shiv Sena government in Maharashtra. The Congress party is embarrassed more so because the prime minister and the finance minister still choose to support Enron and its chairman rather than uphold the Maharashtra government's action and the national interest. Those who see the action as a clever political gambit on the part of BJP and talk mournfully of a setback to foreign investment and the high cost of breaking a signed contract with a multinational corporation are indeed playing into the BJP's hands. Already the gains of scrapping the Enron deal even in financial and material terms is becoming evident. A look at the scaling down of costs and improved terms being offered in its wake in respect of the other so-called fast track power projects in Andhra Pradesh and elsewhere. More important is it that an election pledge to the people has been redeemed by the Shiv Sena-BJP combine. The upholding of the principle of accountability in public affairs which has tended to be grossly violated by political parties by the Congress especially is a great gain for Indian democracy.

The review of the Enron agreement by the Maharashtra government and finally its scrapping have served to emphasise that the deal should not be viewed merely as a case of abuse of power and possibly corruption by the previous state government headed by Sharad Pawar. The public warning by the US administration against a review of the deal and its threat of retaliation had brought matters to a head. The way the Indian government, including the prime minister himself, came out to defend the deal imparted to it far-reaching political significance. It is important therefore that in the aftermath of the scrapping of the Enron deal serious attention is focused on the larger issue of the exceptional rights and privileges being demanded by multinational corporations, especially the US ones, for making investments in India. They insist on total freedom to import equipment and feedstock from their own sources without competitive bidding of any sort and returns on their investment which are not only very high but have to be guaranteed by the Indian government with built-in provisions for escalation. As a number of independent studies by experts had brought out and as has been confirmed by review of the project by the Maharashtra government because of the terms extracted by the multinational corporation the cost of electricity from the Enron project would have been so high as to have inflated costs and prices all round. The Maharashtra State Electricity Board (MSEB) would have been obliged to buy all the high cost power even if it were to suffer huge losses in the sale of the power to the final consumer and even if the cheap power were available from its own ageing plants. The Enron project was actually intended to set the pattern for American companies in particular and multinational corporations in general for investment in India. The Enron episode has thus brought out the high cost to the country not only of this particular deal had it gone through but of the open door policy towards multinational corporations which is such a vital part of the government's economic reform policies. It is from this wider standpoint that the Enron case must be debated in the country and the opposition parties must take it up as a major political issue.

For the prime minister the open door for foreign investment has become the one and only point on his economic policy agenda. This is seen by him as the way to insulate the so-called economic reforms and the performance of the government from political contention. The question is are the opposition parties willing to put up with this position? They certainly have not taken a clear stand so far. The left parties in particular have laid themselves open to jibes from the ruling party on this score. The several state governments being run by the opposition parties find it expedient to take what is euphemistically called a pragmatic position on the role of foreign capital even though the Congress party itself is being compelled in the wake of its electoral reverses to repackage its reform programme in more populist wrapping. It is the leaders of the opposition parties who, with the elections to the Lok Sabha so close at hand appear to suffer from a lack of confidence in the electorate which has unequivocally rejected the Rao government's economic policies including the policy of rolling out the red carpet for the multinational corporations. These parties must respect the sentiments of the people and in their quibbling among themselves not allow the fundamental issues involved in the scrapping of the Enron deal to be obfuscated. Objecting to multinational corporations only in the consumer goods sector is not a good enough position to take. What has to be questioned is the notion that multinational corporations bring in technology for the economic development and modernisation of the developing countries. Not to do so reflects a lack of political will and a tendency to look for solutions which of course are simply not available to India or any developing country.

If the scrapping of the Enron project is to have any meaning at all the mobilising of indigenous sources and capabilities in place of dependence on multinational corporations has to be put at the top of the economic and political agenda. This is particularly relevant to the energy sector. Indigenous equipment making capacity and local expertise in this area are of world standards. Their utilisation is far less costly than anything the multinational corporations have to offer. The first step to activate Indian capacities and capabilities to cope with the growing demand of power is to put in place arrangements for financing projects for power generation from out of domestic savings using indigenous equipment and local skills and a rational tariff policy to ensure a viable rate of return for the domestic investment which will however be far lower than what has had to be guaranteed to Enron and the other so-called fast track foreign projects. Reliance on domestic resources material human and financial will ensure both expansion of power generation capacity and supply of power at reasonable cost. The position on the power front has already grievously deteriorated even as the government has spent much time and energy to sign MOUs with multinational corporations for setting up power plants indeed even while domestic resources and skills have been allowed to remain idle. The result is the

shortfall of between 10,000 and 15,000 MW in the realisation of the Eighth Plan target of addition of 30,000 MW of generation capacity. The scrapping of the Enron deal provides the opportunity to similarly review and terminate MOUs signed with other multinational corporations for setting up power plants on no less adverse terms and conditions. Other countries have taken such action to safeguard their national interests. The talk of loss of face and shaking of the confidence of foreign capital and businessmen is ridiculous. When a country, its people and government assert themselves to secure their vital interests, they regain their own self confidence and in the process the respect and confidence of others, whether foreign governments or companies and businessmen. The way is also opened for more equal, mutually beneficial economic relations, including investment of foreign capital for augmenting the resources for India's economic growth.

It is a fortunate coincidence that the Planning Commission has come out with its review of the performance of the Rao government in the Eighth Plan so far. The review brings out large shortfalls in production and capacity creation especially in critical sectors such as energy and in the social services. Shortfalls of such magnitude and spread have not been recorded in the past, though the story of planning in the last four decades has been very much one of ups and downs. No wonder the prime minister should be trying to keep these findings confidential and even to doctor them. He cancelled the meeting of the full Planning Commission which was to have been held last month for this reason. This has been the standard response of Narasimha Rao whose reluctance to face the truth is well known.

How grotesque this trait is tending to become was emphasised when Rao addressed the meeting of Congress workers at Surajkund organised ostensibly to train them to face the coming election to the Lok Sabha. Rao chose the occasion to charge party workers with nepotism and hunger for personal power which he said had alienated them and the party from the electorate. This was his way of absolving himself and his policies and performance of all responsibility for the sorry plight of the party. But can he himself so casually escape the charge he levelled against his party workers? Rao's Surajkund performance actually exposed his own alienation not only from the masses but even from the workers of his party. The tirade against Congress workers which he made when his own term in office is clearly drawing to a close, unlike Rajiv Gandhi's denunciation of 'power brokers' at the start of his innings as prime minister and party leader, has to be dismissed as the outpouring of a played out small time politician whose personal integrity itself has come under a cloud among Congress workers as well as the general public.

Rao's laborious exercise at Surajkund was futile and unconvincing also as a defence of his economic reforms. In his speech he had to admit without any tinge of remorse though, that 5-6 crore of the top crust of Indian society 'does not need to be canvassed about economic reforms, for they have enjoyed the fruits of the reforms'. As for the next layer of some 25 to 30 crore people, according to Rao they were beginning to appreciate the reforms and its benefits. This was a wishful view of reality. Except for a fraction of the middle strata which may have improved its incomes and consumption levels, the majority of the middle class too has been squeezed by shrinking job opportunities and erosion of the real value of its incomes. And the vast majority, about 65 crore people, have been pushed out of any development opportunity. They have no link with the market-oriented liberalisation and globalisation imposed on the country by foreign business and political interests and zealously implemented by the Rao government in the last four years. Rao, however, refuses to recognise that the alienation of the party he heads from the masses is not a case of failure of communication on the part of Congress workers or the media, as he alleged. The content and direction of the reform programme is fundamentally anti-people. It cannot attract the support of the mass of the people. What is more, the middle classes and even sections of Indian business interests have good reason to be disenchanted with it.

State and Social Security

Amitabh Kundu

The country has made a conscious but unproclaimed choice of allowing people to live in a manner that degrades human life slowly but systematically. This is because the political economy of the country does not offer an alternative irrespective of whether the development strategies it pursues are with or without a human face

DEVELOPMENT planners pleading for marketisation of social infrastructure and basic amenities admit the possibility of and perceive no great danger in allowing the parameters of physical existence some affecting human metabolism, to be determined by the affordability of individuals or community. It has been argued by eminent economists and nutrition experts like Minhas and Sukhatme that the basic needs are not dependent only on human biology. Even the minimum calorie requirement is noted to vary across communities with different history, culture and social norms. They thus implicitly question the essential logic underlying the governmental programmes for providing the minimum needs. One is therefore not surprised to know of a number of scholars from the western world holding the view that infant mortality rate (IMR), life expectancy, etc., in a country should be determined by its affordability. Nagamine has in fact argued that IMR of 20 per thousand is too high for Japan while in the states of India like Uttar Pradesh even 100 per thousand would be acceptable since the state cannot commit more resources to health and welfare activities due to its political compulsions and development priorities.

The above proposition may appear somewhat undiplomatic within the framework of the World Summit for Social Development held in Copenhagen in March this year but has wide currency in terms of the present day reality. Our life expectancy, state of biological system, number of ailments suffered during a year, number of children dying during our lifetime, etc., depend very much on the country we live in. Understandably, the state or people in India cannot adopt the standards of food and beverages of water and air pollution of effluent emission by industries, etc., as in the western world or the U S. Keeping 40 per cent of the vehicles off the roads by adopting the German stipulations, for instance, would be strongly resisted by 'Indian elites'. Similarly, the ministry of industries would consider it all right if a number of manufacturing units continue their production using their obsolete and eco-unfriendly technologies since only a few people would die of pollution compared to the very many that may die of starvation, if the national income is reduced by 30 per cent due to the adoption of certain European stipulations for environmental protection. As a result an average Indian gets exposed to considerable risks to his or her physical metabolism everyday in the struggle for survival. One can thus see that the country has made a conscious but unproclaimed choice of allowing people to live in a manner that degrades human metabolism slowly but systematically. This is because the political economy of the world or the country does not offer an alternative irrespective of whether the development strategies are pursued with or without a human face or heart.

The attempts of the Indian state to prevent transplantation of human organs through legislative and policing system are points of discussion in this context. Needless to mention here that the implementation of the central act passed in 1994 and various other state acts make even donation by genuine relatives difficult. Many of the renowned surgeons and hospitals have been extremely careful in undertaking transplantation cases resulting in delays and corruption. Undoubtedly, attempts to simplify the procedures for such transfers (like that of land and property transfers as attempted in recent years) would imply allowing the present inequality in income and access to power in the country to affect the distribution of biological organs as well. This would amount to degradation of human beings. One should nonetheless ask whether the states responsibility to protect the citizen's right to physical metabolism should end with the prevention of a few hundred cases of kidney transfers. Would one be wrong in dubbing such interventions as mere tokenism as these do not touch the much stronger processes of human degradation, perpetuated by the economic system?

More than 60 per cent of the workers in the unorganised sector endanger their eye sight, lungs, kidney, respiratory system, etc., by the very nature of their work and working environment. The formal and informal relaxations in labour and environmental laws in the late 1980s and 1990s, resulting in the growth of workers in casual and self-employed categories, struggling in poverty have further aggravated the problem. Life expectancy and the state of human

transfer and accumulate land, property, etc, can jeopardise the physical existence of several millions of people as the organ transfer for a few hundreds. Indeed, the impact of an exploitative economic and social system can be far more damaging in terms of sheer number than the transfer of organs. It has been argued, perhaps rightly, that much of the monetary benefits involved often do not reach the donor or his/her family due to the clandestine nature of operations and appropriation of a large portion of the booty by middlemen. Following this reasoning one must be concerned also about the clandestine practices in informal labour market and exploitation of workers by employers or contractors both economically and physically.

Another issue of human abuse agitating the minds of politicians, administrators and activists is that of foreign nationals marrying the poor Muslim women. If the major concern here is that of the brides being often minors, the problem can be dealt within the normal system and all that we need to do is to streamline the system of marriage registration and of age verification. The issue however, has acquired a strong emotional appeal due to a host of other associated factors, such as giving of money to the girl's family, ill treatment after marriage, lack of compatibility due to age difference, etc. Most certainly, none of these possibilities can be ruled out when the bridegroom is from within the country. Save nationalism apart, there are no empirical evidence to suggest that the implementation of legal provisions, particularly regarding torture or sale of women is worse in the countries where the Indian brides are being sought. On the other hand, studies indicate the socio economic as also emotional condition of many among these poor girls marrying persons within their community are quite bad due to the prevailing poverty and its dehumanising features. In fact, the eagerness to find a son-in-law from abroad basically stems from the noticeable affluence of the girls and their families that have succeeded in their venture. Monetary transactions have unfortunately remained a part of the matrimonial system in the country. The state has not been able to do much to curb such practices as it is difficult to identify such transactions and distinguish it from voluntary gifts. Massive efforts made by the state and non-governmental organisations to prevent a few such marriages on ground of human abuse would certainly not alter the unstable socio-economic conditions of the families. This would be similar to the so-called attempts of the US or Germany to ban or boycott Indian products in order to prevent child labour.

It may be satisfying to some of us that such interventions by governments registering symbolic gestures or showing off an apparent concern for physical health of their people are not peculiar to India or the developing world. In Europe or America [illegible] stringent anti-smoking legislation have been passed not merely for public health reasons but exhibition of [illegible] for people's personal health. The [illegible] of the government in raising the [illegible] of citizens however cannot be seen exclusively [illegible] that there has been significant cut in the expenditure on health and welfare of the aged, including the old people's homes in many of these countries. Faced with the problem of providing basic amenities to the growing aged population who are both physically and economically handicapped the per capita expenditure on the welfare programmes for the elderly has gone down significantly in the 1990s. In view of these the avowed claims of the government to become custodians of personal health of people appears more of a hypocrisy and [illegible] in policy.

Ernest Mandel

Achin Vanaik

What was remarkable about Ernest Mandel was that he could inspire great respect at both levels – as an exceptionally gifted intellectual particularly in the domain of economics and as a revolutionary theorist.

ERNEST MANDEL was in many ways a representative of the classical European intellectual tradition – the tradition of the Enlightenment – in which Marxist and Marxist thinkers like Mandel have their roots. It is a tradition that at its best has produced those rounded personalities more akin to the ideal types of heroes of the Renaissance with their many-sided abilities and multiple creativities contrasted to the more specialised thinkers and role players of today and it is a tradition that is now rapidly declining in Europe itself.

That is to say Ernest Mandel belonged to a tradition for whose members it was natural to be fluent in a multiplicity of languages and for whom intellectual endeavour would automatically seek to span a very wide range of disciplines. The best of them like Mandel himself could not only think big but also develop responsibility all the more incumbent upon them by virtue of his being a Marxist or Trotskyist the most internationalist in outlook of Marxist currents. He could speak [illegible] and polemicise skilfully in Flemish, German, French, English and Spanish and had an adequate level of Italian and Portuguese. His writings displayed a powerful mastery not just of economics but of virtually all social science disciplines sharing philosophy and aesthetics.

Mandel was of course much more than just an economist or a many-sided intellectual even a revolutionary theorist. He was a revolutionary activist from his youth committed in his practice to the [illegible] to overthrow capitalism and to develop the Fourth International which he saw as an absolutely vital instrument in this struggle. He became a member of the central committee of the Belgian section of the Fourth International at the age of 17. Like another precocious Belgian Trotskyist and Jew Abraham Leon who was a few years older to him Mandel was imprisoned by the Nazis during the second world war but unlike Leon managed to survive imprisonment and avoid the gas chambers. Leon wrote a remarkable book while imprisoned on the Jews as an oppressed people [illegible] but strongly repudiated Zionism. Mandel too never wavered in his intransigent hostility to Zionism and in his support for the righteousness of the Palestinian cause even as he felt the deepest empathy all his life with the plight of the oppressed everywhere including with the historical travails of the formation of the Jewish diaspora.

If the Trotskyist movement suffered a great loss in the early death of one remarkable Belgian revolutionary Abraham Leon it benefited enormously from the output and commitment of another Ernest Mandel who died last month at the age of 72. It was precisely because his intellectual activity always had a political and organisational context and thrust that unlike other more free-floating radical intellectuals (e.g. Isaac Deutscher or Jean Paul Sartre) Mandel for a major part of his life was banned from entry into a number of advanced capitalist countries. On one occasion when refused entry into the US to engage in a debate with John Kenneth Galbraith the debate had to be held through transatlantic telecommunications.

[illegible] most feared polemicists. Anyone privileged to have listened to him can testify to his spellbinding qualities. The sheer range of his knowledge and understanding and his formidable grasp of economics (the alchemy of our times) coupled with his supreme self-confidence that he was more than a match for any ideologue of capitalism anywhere, made him into something of a super-gladiator of the radical left. If intellectual balance is not always best served by such skills, political life and activity cannot do without the cut and thrust and opinion influencing qualities of such kinds of debate and discourse. The pure intellectual can practise agnosticism in the face of imperfect and uncertain knowledge and delude himself or herself that he or she is avoiding the taking of a political position. The political activist and intellectual suffers from no such delusion. Positions and perspectives have always to be taken despite imperfect knowledge and then acted upon.

What was remarkable about Mandel was that he could inspire great respect at both levels – as an exceptionally gifted intellectual particularly in the domain of economics and as a revolutionary theorist. As an economist Mandel had a very wide appeal across all currents of the left and for a brief time in the 1970s when the end of capitalism's golden age coincided with the existence of a small but vibrant and growing [illegible] left his economic writings even had to be taken serious note of by the leading figures of mainstream bourgeois economics such as Paul Samuelson (author of the single most important undergraduate economics textbook ever) and Assar Lindbeck (the key Swedish economist and figure responsible for selection of economics Nobel prize winners). It was in this period that he was asked to deliver the prestigious Alfred Marshall lectures at Cambridge University an honour rarely if ever given to a Marxist economist. The latest edition of those lectures will soon reappear as *The Long Waves of Capitalist Development*. His other major economic works include *The Formation of the Economic Thought of Karl Marx* (a work displaying remarkable grasp of Marx's anthropological thought as well) the famous expository two-volume *Marxist Economic Theory*, *The Second Slump* (explaining the end of the long post war capitalist boom) *The Meaning of the Second World War* a highly original analysis of the economic causes purposes and consequences of the second world war and his economic *magnum opus Late Capitalism* a work which among other things through its argument that capitalism in its latest phase actually exhibited the purest characteristics of capitalism as understood by Marx, laid the economic foundation for Frederic Jameson's own pathbreaking work on post modernism.

and the cultural logic of contemporary capitalism

In his other avatar as a revolutionary leader and theorist affiliated to the Fourth International and foremost defender (after the death of Trotsky and Isaac Deutscher) of the Trotskyist-Leninist tradition in the spectrum of Marxist or Marxist-inspired currents, the quality and range of his output was no less remarkable but had a less wide appeal Here his major works include *From Stalinism to Eurocommunism Revolutionary Marxism Today, Trotsky A Study in the Dynamics of His Thought, Power and Money* (a major analysis of class and bureaucracy), as well as Marxist primers like *Class Society to Communism*, and innumerable pamphlets, essays and articles on an immense range of classical Marxist and contemporary social, political and economic problems in all parts of the world His was an encyclopaedic mind (He even penned a book called *Delightful Murder* that is perhaps the best social history ever of the genre of crime and thriller novels)

Such writings necessarily had a more limited appeal even on the left because they were more directly politically challenging constituting as they did, a defence of the Trotskyist tradition as the representative of classical Marxism and demanding in the name of political coherence and integrity some considerable degree of affiliation with that tradition as embodied in the Fourth International For many among the admirers of Mandel this was obviously much more difficult to swallow In this respect there was a striking parallel found in the reception accorded to Gramsci and Trotsky, respectively by the new and old left after the post-1960s discovery of Gramsci's intellectual and political importance

It has always been easier to affiliate oneself in some way or the other with the legacy of Gramsci although, for all his originality, Gramsci was by all objective standards, a lesser theorist than Trotsky This is because there is no living organisational embodiment of Gramscianism and therefore no real challenge to one's own organisational affiliations To the Trotskyist tradition belongs the honour of being the first, the most consistent, as well as the only serious living organisational embodiment of the historic challenge to Stalinism posed within Marxism To be sympathetic to Trotskyism in theory has always demanded more in terms of practical commitments than to be sympathetic to other anti-Stalinist currents on the Left

Ernest Mandel would never let anyone forget this At the peak of his public influence, roughly the period between the French May in 1968 and the Nicaraguan Revolution in 1979, Mandel was responsible more than any single other person for attracting radicals to the banner of Trotskyism and the Fourth International Certainly, those responsible for bringing out the *New Left Review* as the flagship of independent Marxist thought in the English speaking world (and elsewhere) during this period, were greatly influenced by him as well But Mandel could not buck the subsequent changes in his own lifetime — the worldwide shift to the right in the 1980s and 1990s

The end result is something that Mandel, and Trotsky before him, would not have been entirely pleased about In both cases, in India as well as elsewhere, the individual looms much larger than the organisation that the mentor and his most able disciple yet fought and lived for Unless times change in ways yet unperceived, the most powerful memory likely to be left behind by Ernest Mandel is that of a remarkable person living a remarkable life and producing remarkable thoughts It is still something for progressives and Marxists everywhere to cling on to and to be thankful for on the eve of our entry into the deepening uncertainties of the third millennium

A Rebel in Saffron

M S S Pandian
Anandhi S

Consistently privileging wider social concerns, Adigal stood against all forms of religious and political orthodoxy

SRI Deiva Sigamani Arunachala Desikar (1925-1995), popularly known as Thiru Kunrakudi Adigal died on April 16 at Madurai Clad in saffron and sporting a flowing beard, he headed the Kunrakudi-Tiruvannamalai Adheenam, a saivite mutt of importance, for over four decades In his death, which was mourned by a wide spectrum of people including a large number of atheists, Tamil Nadu has lost a prominent public figure for whom religion signified a celebration human will and spirited engagement with this worldly inequalities

When he became the 45th head of the Kunrakudi Adheenam in 1952, the Tamil-speaking areas were full of Periyar E V Ramasamy's atheistic campaign The saivite orthodoxy looked forward to Adigal to counter Periyar Arul Neri Thirukkootam, then a forum of the saivite orthodoxy mobilised Adigal s fine debating skill in an attempt to retrieve the ground already lost to Periyar, and even sent him to Malaysia, soon after Periyar's visit to that country to blunt the impact of Periyar's anti-religious propaganda This phase of antagonism between Periyar and Adigal did not last long

In 1955, both of them met and the early conflict gave way to years of active collaboration Adigal relinquished neither the saffron nor saivism, but declared, "I am doing whatever is possible for me towards destroying caste and caste system as well as towards social reform I am neither scared nor worried about anyone's opposition I am waiting to participate fully in Periyar's anti-caste agitations " Soon, caste and untouchability became recurrent themes in *pattimantrams* (publicly staged debates) organised by him In 1970, when the DMK government brought in the Archakas Act, which paved the way for anyone, not brahmins alone, to become a temple priest without consideration to caste, it was met with stiff resistance from the Hindu-brahmin orthodoxy Adigal distanced himself from the campaign against the act and *Theiviga Peravai*, an association of saivite mutts of which Adigal was the most active member, extended full support to the act His life-long struggle against caste system made him rather critical of orthodox Hinduism In 1983, participating in a conference of the heads of Hindu religious mutts, he asked, "Has any mutt chief, who talks of Hindu unity, ever tried to appoint a Hindu from any oppressed caste as the chief of the mutt? If the member of the oppressed caste converts to Christianity he can become a cardinal, he can become a priest The situation is different in Hinduism Have you at least allowed the oppressed to read the *Vedas*?"

The finest moment of Adigal's privileging the wider social concerns over narrow saivism was perhaps in 1971 In that year, Dravidar Kazhagam organised a Superstition Eradication Conference in Salem, and as part of the conference procession the image of Rama was slippered in public The Hindu right in the state, mostly composed of brahmins, with the support of C Rajagopalachari, made much hue and cry Their high-pitched campaign was directed against the DMK government Adigal intervened in the controversy, but on the side of the atheists He issued a brief public statement in which he minced no words about where his sympathies were "Today theism stands for the welfare of the upper castes, and atheism stands for the welfare of the majority of the Tamil people "

Plea for Popularising Science

Adigal was deeply committed to the cause of Tamil language which was in keeping with the age-old saivite tradition in Tamil Nadu. In 1965, in the thick of the anti-Hindi agitation which directly challenged the homogenising desire of the Indian nation-state, he led a procession in Kunrakudi against the imposition of Hindi and courted arrest. It was the same spirit which inspired him to turn down the invitation to the sanctum sanctorum of the Chidamparam temple by the Dikshitars in 1983. He publicly resented the 'archanas' in the temple being conducted in Sanskrit, which most devotees did not understand. While recognising Tamil as the right of the Tamil people, he was acutely aware of Tamil language lacking in many respects. What caught his attention the most was the inadequate access to science through Tamil. Most of his public discourses on Tamil and its glories veered towards a plea for science in Tamil. The last public meeting which he attended was an award-presentation function for scientists at Karaikudi. When all the eight scientists who were presented with awards spoke in English, Adigal appealed to them to return science to Tamil and said, "Only when we can have access to scientific ideas in Tamil, our land will progress."

His passion for science took concerete shape in the rural reconstruction programmes which he launched in Kunrakudi and neighbouring villages in 1977. Inspired by Chinese communes, he worked hard to turn Kunrakudi and other villages in its neighbourhood into self-sufficient communities by utilising the local resources and by taking science and technology to the people through village planning forums. With the expertise of scientists from the Central Electro-Chemical laboratory at Karaikudi, he recast the resource-use pattern in these villages and established a situation of near full-employment. 'Kunrakudi pattern' has come to be part of the rural development parlance. What is more, in 1992, the ministry for science and technology presented Adigal with the national award for popularising scientific attitude among the people. As V C Kulanthaisamy, the former vice-chancellor of Indira Gandhi National Open University, remarked, "To our knowledge, the only religious leader to have received the national award for popularising science and scientific attitude among the people is Adigal." While a picture of Lenin hung on his wall, he used to tell of Marx, "The philosophers before Marx wrote of what the world was and what the world is. No philosopher has said of how the world should be and what changes are needed. Not only we have the right to think about how the world should be and to change it, but it is our duty. That is Marx's philosophy."

World Affirming Activism

During the last phase of his life, he spent substantial part of his time and energy, despite failing health, towards bringing communal amity among different religious groups in Tamil Nadu. While he exhibited tremendous courage in visiting the riot-affected Kanyakumari district in 1982, he unequivocally condemned the demolition of Babri masjid. He willingly participated in every effort, even by small groups, towards communal peace. It is not surprising that a large number of Muslims participated in the funeral of this saivite religious head without any apprehension about the much larger number of Hindus who were present.

Adigal's societal concerns and interventionist religiosity was perhaps nowhere more explicit than in a resolution passed by the Arul Neri Thirukkootam under his headship in Tiruchi in 1982. The general body of the organisation endorsed its faith in god and proceeded to resolve that it "should treat organisations like [illegible] which are involved in the abolition of untouchability and caste, and communist movements, which are involved in establishing a povertyless society, as allies; and brahmanism and its organisations, which insist that caste differences, poverty and destitution are results of *karma*, as foes...". If Adigal could get such a resolution passed, spirituality for him meant something different from what it is normally believed to be. As he put it, "Lot of them believe that spirituality depends on renunciation. It is a mistake. Hating the world is not spirituality. Understanding the world, living in it, and progressing along with the world is spirituality."

The finest endorsement of his radical religiosity came from none other than the chief minister of Tamil Nadu, J Jayalalitha, and the Sankaracharya of the Kanchi mutt, Jayendra Saraswathi. Throwing common civilities to wind, they chose not to condole his death. Given their conservative and right-wing political location, their silence was indeed a larger statement about what Adigal meant for the oppressed in Tamil Nadu.

THE TRAP CALLED TEACHING

Reflections on Teaching and Teachers

by **Amrik Singh**

In this thought-provoking and densely written book, Amrik Singh has put forward a provocative hypothesis. He argues that, till the late seventies, the problem in higher education was of declining standards. Since then, the issue has become more complex. Declining standards is certainly a problem, but a problem which should claim prior attention is how to combat corruption that has crept into universities and colleges.

ISBN 81-220-0394-X 1995 252pp. HB: Rs. 300/- PB: Rs. 150/-

THE CRAFT OF TEACHING

It is a book no honest teacher can do without. If you are beginning your teaching career, it is indispensable. And if you have been teaching for some time, it broadens and deepens your understanding of what it means to be a teacher and how one should go about the job.

Gowari Deaths

Crucial Issues Neglected

Bageshree Vaze

The issues which prompted the gowari tribals to mount the large-scale protest last year, subsequently leading to the large number of deaths in the police lathi charge, are yet to be addressed by the state government.

ALMOST a year after more than 113 gowari tribals died during a police lathi-charge in Nagpur, the Maharashtra government has shown little interest in addressing the issue beyond providing financial compensation to the families of the victims. The newly-elected BJP-Shiv Sena regime has yet to take concrete action to investigate the incident, despite their pre-election promises. And although a Bombay-based human rights group has published a report holding the Nagpur police largely responsible for the massacre, a recurrent issue in Indian caste and tribal politics is being sidelined perhaps until the occurrence of a future similar tragedy Gopal Guru, (*EPW*, February 11), had asserted the incident suggested a crisis in Maratha hegemony: a marginalised section of society decided to fight government insensitivity and the BJP opposition capitalised on the aftermath of the massacre by helping perform the last rites of the victims. However, the massacre did not figure as a crucial issue at the time of the state's February elections and a full probe into the incident has not been considered an immediate priority for the new government.

The findings of the Indian People's Human Rights Commission (IPHRC) are hardly unique, merely reinforcing common knowledge of police callousness towards minorities in India. The IPHRC invited police authorities to provide their version of events at inquiry hearings held in early March, but no representative turned up. Its report is based solely on testimony given by more than 50 gowaris who had attended the morcha. S M Daud, former judge of the Bombay High Court and K K Narendran, former judge of the Kerala High Court oversaw the three hearings held at Pulgaon, Sakoli and Nagpur. Approximately 50,000 gowaris had gathered from Nagpur and its outlying areas in front of council hall, the legislature building on Novemebr 23. Sudhakar Gajbe, the president of the local Gowari Sanghatana, had mobilised his fellow tribals to demand recognition as a scheduled tribe entitled to government reservations. Peaceful dembnstrations, fasts, sit-ins and processions are common in Nagpur during November when the Maharashtra legislature holds sittings in the state's former capitol city.

Gowari tribals are rural labourers, believed to constitute somewhere between 10-15 per cent of the population of the state's Vidarbha district. For the past 10 years, they have been fighting for recognition as a distinct group who should receive benefits under the government's tribal welfare provisions. Constitutionally, deptessed and economically backward sections of India are entitled to concessions is employment and education – that is, arrangements are made to ensure members can acquire jobs and receive admission to colleges While a larger debate rages over the degree of reservations for the marginalised, controversy over the gowaris' status as a distinct tribe has existed since the 1960s. The group has been confused as a sub-group of the Gond tribe – a Maharashtra government resolution of April 24, 1985 claimed the gowaris had been taking undue advantage of their name's similarity with that of the 'Gond-Gowari' scheduled tribe. Mantralaya subsequently stopped issuing concession-entitling certificates to the gowaris

Gajbe and other gowari leaders, frustrated with filing numerous petitions and meeting with government leaders to no avail, decided a morcha might be more effective. The IPHRC report provides background context and reiterates most of the details of the November 23 massacre provided by newspapers at that time. Men and women of all ages – whole families including small children – after marching from Patwardhan ground to the 'T' point in front of the legislature building, endured the hot afternoon sun for about five hours, with the hope a government representative would address them at some time. Because of the massive size of the assembly, people sat huddled together uncomfortably and while most of the witnesses say they maintained a distance of 10 to 100 feet from the police barricades, some concede they may have pushed too close to the front.

The IPHRC report says that while the gowaris may have shouted slogans condemning the government, they were not aggressive and did not incite the police to violence. The police informed the leaders that the ministers would meet a five-member delegation, but Gajbe asked that the chief minister himself meet the crowd. The crowd was later told the chief minister had left for Bombay, so the gowaris asked that some other minister meet them. Around 6 pm, after darkness had begun to descend, the leaders were told no minister was available to meet them. Gajbe decided it was necessary to tell the gowaris of what had happened and ascended a rickshaw with a microphone in his hand. While he was speaking, a white or cream-coloured Ambassador car with flashing red lights appeared at the front of the crowd and the gowaris thought a government VIP had arrived. Slight commotion ensued in which those who had been sitting for hours suddenly stood up and moved nearer the police barricades.

The gowaris appearing before the IPHRC tribunal claimed the police, perhaps upset by the movement in the crowd, removed the barricades and rushed at them with canes. There are points of discrepancy among some of the witnesses, a few saying gun shots were fired, others insisting the police burst tear gas shells. Nonetheless, the gowaris, with no place to run except to the rear – they were cut off on all sides by road-blocks – trampled over each other in mass confusion as the police began caning them.

The unfortunate turn of events might have been prevented had a police official read out the Riot Act or asked the crowd to disperse. Witnesses told harrowing personal accounts; the police rounded up the wounded and sent them to hospital, literally flinging women and children into awaiting police vans. Many of the gowari witnesses say the officials took advantage of the confusion to even steal jewellery and personal belongings of the wounded Shanta Dhondiba Neware, 40 says, "even the ones who could have lived were thrown (by the police) and died"

There is no question in the minds of the gowaris that the police are solely to blame for the massacre, despite the then chief minister Sharad Pawar's claim that the tribals had instigated the incident. Gajbe, whose nine-year-old daughter perished in the stampede, says Pawar's claim was absurd. As Ranjana Suryaban, 20, told the IPHRC, "What use was there in starting a charge on ourselves"? Families of victims were subsequently compensated – some received as much as Rs 2 lakh for their grievances – but such concessions hardly deal with the massacre's underlying issue: the gowaris are adamant the government provide them with more opportunities in education and employment. B V Kolte, deputy secretary of the state's home department, says the government has appointed a Nagpur-based inquiry commission, but it is uncertain as to when it will begin its work.

Still, Gajbe and the other gowari leaders have not given up their fight for recognition as a scheduled tribe. Soma Sen, an IPHRC activist in Nagpur, thinks the gowaris should continue their struggle, despite the lack of government response. "I hope they form some sort of revolutionary movement on their own, since the government doesn't seem to be addressing their concerns." The gowari tragedy is only one incident of many in the increasingly tense atmosphere of caste relations around the nation. Given the government's lack of action in dealing with such a significant feature of Indian politics, it is understandable Indians have more or less forgotten last year's stampede.

Egypt's Troubles at Home and Signals Abroad

Ninan Koshy

The compulsions of accelerating developments in west Asia and North Africa are demanding a reorientation of Egypt's political and economic relations and a reassessment of its role in the region

WHILE the sabre rattling by Egypt against Sudan in the wake of the assassination attempt on president Mubarak has been chiefly meant to whip up nationalistic fervour and divert attention from a deepening domestic crisis there are indications of a reorientation of Egypt's role in the region and consequent diplomatic initiatives

The occasion of the 43rd anniversary of the Nasser led revolution was used by president Mubarak to repeat his accusations against the Sudan government that it organised the attempt to kill him in Addis Ababa He called Sudan an exporter of international terrorism with the sick dream of a pan Islamic state stretching from Algeria to Sudan Egypt thus was affirming its role as the defender of the whole region

The Egyptian government has not provided any evidence to link the assassination attempt to Sudan What evidence is available shows that those primarily responsible were most probably Egyptians However this has not prevented president Mubarak from repeatedly pointing the finger at Egypt's neighbour and its ideological leader Hassan al Turabi The tirade against Sudan was successful in creating an upsurge of nationalist fervour in Egypt

The repetition of the accusations against Sudan even one month after the incident shows that Mubarak is keen to focus attention on the alleged terrorist threat from Sudan and to keep public and international attention away from domestic politics Immediately after the assassination attempt Egyptian troops attacked their Sudanese counterparts in the disputed border area of Halaib on the Red Sea in which two Sudanese were killed and 10 wounded Both parties reinforced their military strength in the region It is true that the National Islamic Front (NIF) of Sudan sees itself as the vanguard of the revolution in northern Africa (and indeed internationally) and boasts of its increasing influence In December 1994 neighbouring Eritrea broke off diplomatic relations with Sudan accusing it of Islamist destabilisation and Ethiopia has less publicly voiced the same fears Thus Egypt may have a strong case in its general criticism of Sudan

The crisis in Egypt Sudan relations has much to do with the changes in the Horn of Africa, the assertive and even militant role of Sudan and the ideological and other possible links between some sections of Egyptian opposition and Sudan Traditionally Sudan was subject to exploitation by Egypt in many ways Today there is a new situation As a senior official of the Eritrean government wrote [*The Sudan Democratic Gazette* London February 1995]

> It is evident that on the whole Egypt has been pursuing an hegemonistic and unfair policy to undermine Sudan's full independence and to impede the growth of extensive agricultural programmes through irrigation On the other hand the National Islamic Front has demonstrated a determination to assert Sudan's independence and to redefine its ties with Egypt on equal terms although it conducts fundamentalist and perilous political adventures This has caused Sudanese Egyptian relations to plummet and Cairo to be perturbed by the turn of events for the first time in the history of their bilateral ties Current attitudes to and the orientation of Egyptian policy towards the Sudan should indeed be viewed and evaluated from this perspective

The Addis Ababa incident has put Egypt on a collision course with Sudan and it is not easy to turn back Egypt is likely to seek actively the undermining of the NIF government in Sudan and it may assist the opposition to it

Till now there has been noticeable ambivalence and even confusion in Egypt's attitude to the Sudan government and opposition This period now seems to be over The 1989 coup in Sudan was initially welcomed by Egypt as a necessary military putsch against the unstable democracy of its old rival Sadiq el-Mahdi But when the Khartoum government developed a clear Islamist ideological stance Cairo changed its mind but was unsure as to what to do For some time it seemed to believe in its own theory that in Sudan the military was good but the Islamist elements were bad

Egypt not only did not help the Sudanese opposition it suppressed public demonstrations by it (mainly by southern Sudanese) The police action against southern Sudanese refugee women received international attention Sudanese belonging to different political groups and parties bitterly complained of harassment by Sudanese authorities All this changed suddenly when the Sudanese opposition alliance was not only allowed to hold demonstrations against the Khartoum regime but was received by Mubarak for a photo opportunity publicised in the television The semi-official press gave a lot of coverage to the Sudanese opposition and made a distinction between the Sudanese people and the Sudan government This has given a definite boost to the National Democratic Front which had just concluded in Eritrea its most important meeting since 1989 While the Egyptian government fully utilised the assassination attempt for an orchestrated campaign against Sudan and international terror it did not succeed in diverting the attention from the domestic situation which many believe is fast approaching a crisis

In fact some commentators have gone to the extent of saying that in the absence of a dramatic shift in a number of directions, Egypt may soon find itself in the situation of the last days of Iran under the Shah They point out several basic indicators of the regime's instability, deep economic recession, the government's inappropriate response to economic challenges the failure of political response, the growing violation of human rights, the insurgency and the divisions within the security forces

The economy is in tatters with economic growth falling relative to population growth, unemployment, poverty and malnutrition rising and the gap between the rich and the poor widening The IMF and the World Bank believe that Egypt's economic prospects show definite signs of improvement However the real story of Washington directed reform has largely been one of disaster for the majority of Egypt's population Most of the reforms have benefited only the better-off In the absence of effective measures against the endemic corruption and elitism and a sustainable redistribution of wealth to Egypt's poor economic reforms will only heighten social tensions The Egyptian government is yet to realise that the best weapon against the insurgents is economic and social justice

Islamic Militancy

Islamic extremist political movement owes its origin in part to the policies of Anwar Sadat who unwisely used the Islamists as a counter to the powerful secular leftists during the 1970s He supported the Islamic groups financially while personally cultivating an image of religious piety His eventual rejection of the objectives of these groups and the signing of the Camp David peace accord sealed his fate Militant Islam in the shape of Jamaat al-Islamiya was now to become Egypt's dominating political issue

international significance in view of the role assigned to Egypt in the region by the west The general consensus is that the Islamic groups possess neither the necessary organisational structure, charismatic leadership or broad enough public support to threaten Mubarak seriously In that sense Egypt is not like pre-1979 Iran Mubarak's response to Islamic militants has been to tightening security screws and adopt increasingly more repressive measures This has inevitably resulted in grave violations of human rights

The case that highlighted human rights abuses in Egypt and attracted unusual interest inside and outside Egypt was the death in police custody in late April 1994 of Abd al Haith Madani a lawyer with ties to the outlawed Jamaat al Islamiya It sparked off protests and eventually led to a hunger strike by his fellow pro-Islamist lawyers The government first claimed that Madani had died of an asthma attack but then refused to release the autopsy report or even to allow his family to see the body (which was delivered to them in a sealed coffin) The case still haunts the Mubarak government

In trying to justify an increasingly authoritarian rule the government cites the example of Algeria even arguing how risky free elections can be In March 1994 the government rushed through parliament a measure withdrawing the rights of villagers to elect their mayors and deputy mayors The explanatory note attached to the draft law stated that the application of the election system proved that it is a threat to public order and security because it augmented already existing rivalries between the major clans in the villages The note went on to explain that elected mayors were more concerned with satisfying voters than with order and security and that in any case elections were costly

The following month the state council granted wide ranging censorship powers to 'al Azhar despite the objections of the ministry of culture Civil libertarians took a particularly dim view of the development because in recent years the shaiks who run al Azhar's censorship review board known officially as the Islamic Research Academy have construed their right to examine "Islamic work and productions or those which relate to Islam" as a licence to ban virtually everything Ironically in the name of containing political Islam Egypt has over the last two years granted even broader powers over public discourse to the most conservative elements of official Islam

The latest among the measures infringing civil rights is a new law that prescribes punishments for journalists by imprisonment up to five years as well as heavy fine in cases of defamation or spreading 'false information' The government is adamant that the press should be held to account for what is seen as attacks on 'national interest' Critics say that the law is so vaguely worded that it allows the government virtual *carte blanche* to prosecute journalists The People's Assembly passed its final draft virtually 'in secret according to opposition sources, after precious little debate and with no consultations with the media It seems that articles that implicate politicians in corruption scandals have rattled the government

The peace process in west Asia which involves Israel and some Arab states in addition to the Palestenians appear to be prompting Egypt to reorient its foreign policy including economic diplomacy President Mubarak's visit in mid November last to London and Rome with the primary purpose of gaining support for Egypt's economic programme received considerable attention internationally

Interestingly the Egyptian leader's visit came shortly after a surprise announcement that Egypt had applied to join the Arab Maghreb Union the regional economic and security forum which brings together Mauritania Morocco Algeria Tunisia and Libya It was obvious that the move was not welcomed by all The Tunis government apparently protested while Algeria was reticent Egypt seems to have the support of Morocco which probably feels that Egypt's presence in the Union will avoid the dominance of Algeria But even Tunisia and Algeria will find it difficult to oppose Egypt's entry and Libya will lend support, as it is indebted to Egypt for defending it against the western onslaught for its alleged involvement in the Lockerbie affair

Egypt may have some good reasons to join the Maghreb Union It wants to affirm its role as a Mediterranean power in addition to being a middle eastern leader Mubarak's trip to Europe made it clear that economic and political relations with Europe are high on his agenda This is important at a time when the European Union is redefining its Mediterranean policy on economic co operation on the initiative of France There may also be the consideration that depending almost solely on the US may not be a viable proposition on a long term basis Despite delays in getting new co operation agreements signed with Morocco Tunisia and Israel the European Union has already started negotiating with Egypt a new partnership agreement aimed at reinforcing bilateral trade and investment relations

At a time when Israel is fast building economic relations with a number of Arab countries including some from the Gulf region Egypt feels that it may be left out and wants to reassert its influence and wishes to remind Arab states of its central role Joining the Maghreb Union is one way of doing this

Thus the compulsions of accelerating developments in west Asia and North Africa demand reconstitution of political and economic relations of Egypt and a reassertion of its role in the region

CENTRE FOR ECONOMIC AND SOCIAL STUDIES

Applications are invited for the post of a Senior Fellow from scholars in economics with proven research capabilities in the field of Public Finance The candidate must have worked in the area of State finances, taxation policy and should have familiarity with federal financial issues Competence in quantitative methods and in the use of computers is desirable

Qualifications
1 M A in Economics/Econometrics with a First Class or high Second Class
2 Ph D or equivalent published research

The above post carries the U G C scales of pay in the Professors grade Other allowances will be in accordance with the regulations of the Centre

Applications, forwarded through proper channels where necessary on plain paper must reach the Director, *Centre for Economic and Social Studies*, Nizamiah Observatory Campus, Begumpet Hyderabad – 500 016 by 15th September 1995

SCHEDULE 17

NOTES ANNEXED TO AND FORMING PART OF THE ACCOUNTS OF THE INDIAN BRANCHES FOR THE YEAR ENDED MARCH 31, 1995

A STATEMENT OF ACCOUNTING POLICIES

i BASIS OF PRESENTATION

The financial statements have been prepared on the historical cost basis in accordance with generally accepted accounting principles and conform to the statutory requirements prescribed under the Banking Regulation Act,1949.

ii FOREIGN CURRENCY TRANSLATION

Assets and liabilities in foreign currencies are translated at year end rates of exchange. Revenues and expenses have been translated at rates prevailing on the transaction date. Foreign exchange trading positions including spot and forward contracts are valued monthly at prevailing market rates and the resulting gains and losses are included in foreign exchange revenue.

iii CREDIT LOSSES

The Bank has a consistent internal policy of classifying its commercial and consumer loans and advances and full provision for credit losses and writeoffs, have been made to satisfy the Prudential accounting norms prescribed by the Reserve Bank of India for asset classification and for income recognition.

iv SECURITIES

The Bank has been consistently classifying its securities portfolio into permanent (investment) and current (trading). Permanent investments are valued at cost and the premium paid in excess of the face value ammortised to maturity. Current investments are valued at the lower of cost and market value in aggregate for each category in compliance with the Reserve Bank of India requirements. Treasury bills, Commercial paper and Floating rate notes are valued at carrying cost.

v PREMISES AND EQUIPMENT

Premises and equipment are stated at cost/valuation less accumulated depreciation. Depreciation is computed on written down value method (other than certain assets in staff quarters for which depreciation is computed on straight line method) with reference to the estimated useful life of the asset. During the previous year certain premises belonging to the Bank in India were revalued by an approved valuer as at March 31, 1994 and the increment in value amounting to Rs. 686,574,000 was brought into the books of account and credited to Properties revaluation reserve. The depreciation on the incremental value amounting to Rs. 3,432,900 has been charged to Property revaluation reserve.

vi STAFF BENEFITS

The Bank has fully funded contributions to the Pension Fund and Superannuation benefits for its employees with the Life Insurance Corporation of India.

vii INCOME RECOGNITION

The Bank follows a procedure of income recognition which satisfy the norms prescribed by the Reserve Bank of India.

CITIBANK

(Incorporated with Limited Liability in U.S.A.)

SCHEDULES FORMING PART OF THE ACCOUNTS OF THE INDIAN BRANCHES FOR THE YEAR ENDED MARCH 31, 1995

SCHEDULE 17 *(contd.)*

NOTES ANNEXED TO AND FORMING PART OF THE ACCOUNTS OF THE INDIAN BRANCHES FOR THE YEAR ENDED MARCH 31, 1995

viii NET PROFITS

The net income disclosed in the Profit and Loss Account is after:

—accounting for credit losses

—provision for interest tax and income tax

—other usual or necessary provisions

—valuation adjustments in respect of securities

—charge for Head Office and Administrative expenses for the year as advised by the Head Office.

B The Bank has retained in the "Properties Investment Reserve" as at March 31, 1995 Rs. 619,430,700 (1994: Rs. 619,430,700) as per the Reserve Bank of India's guidelines

C Other Accounts under the head "Other Liabilities" and "Other Assets" include amounts pending transfer to appropriate accounts. Other assets include amounts deposited with SIDBI for meeting Priority Sector lending limits, under the head "others".

D Bills received from constituents for collection on their behalf are controlled through memorandum registers and are recorded in financial ledgers only when collected. These bills for collection outstanding as at the year end have been stated in the Balance Sheet.

E Profit on sale of investments is net of adjustment for valuation.

F The Bank has discontinued the Portfolio Management scheme in August 1992.

AUDITORS' REPORT ON THE ACCOUNTS OF THE INDIAN BRANCHES OF CITIBANK, N.A. UNDER SECTION 30 OF THE BANKING REGULATION ACT, 1949

We have audited the attached Balance Sheet of the Indian Branches of Citibank, N.A. (incorporated with Limited Liability in the U.S.A.) as at March 31, 1995 and the relative Profit and Loss Account of the Indian Branches of the Bank for the year ended on that date signed by us under reference to this report.

In accordance with the provisions of Section 29 of the Banking Regulation Act, 1949, read with the provisions of the sub-sections (1), (2) and (5) of Section 211 and sub-section (5) of Section 227 of the Companies Act, 1956, the Balance Sheet and Profit and Loss Account together with notes thereon, are not required to be and are not drawn up in accordance with Schedule VI to the Companies Act, 1956. The accounts are, therefore, drawn up in conformity with Forms "A" and "B" of the Third Schedule to the Banking Regulation Act, 1949.

1. We have obtained all the information and explanations which to the best of our knowledge and belief were necessary for the purposes of our audit and have found them to be satisfactory.

2. The transactions which have come to our notice have been, in our opinion, within the powers of the Indian Branches of the Bank.

3. In our opinion, proper books of account as required by law have been kept by the Indian Branches of the Bank so far as appears from our examination of these books.

4. The above mentioned Balance Sheet and Profit and Loss Account of the Indian Branches of the Bank dealt with by this report are in agreement with the books of account.

5. In our opinion and to the best of our information and according to the explanations given to us, the Balance Sheet and Profit and Loss Account together with and subject to the notes thereon give the information required by the Companies Act, 1956, as amended in the manner so required for Banking Companies and on such basis the said Balance Sheet gives a true and fair view of affairs of the Indian Branches of the Bank as at March 31, 1995 and the Profit and Loss Account gives a true and fair view of the Profit of the Indian Branches of the Bank for the year ended March 31, 1995.

PERSPECTIVES

Sociology of Law in India

Postscripts and Prospects

Vikash N Pandey
Akhileshwar Pathak

As social change/reproduction is not affected by any single social stratum in isolation different strata perceive social forces differently, depending on their location in the existing order and attempt to modify them Evolution of law is part of this social process The text of law is itself a register of these negotiations and is therefore a contested domain

THE task of integrating social relations and legislations in a unified field continues to be unaddressed [Das 1974 Baxi 1986 and Dhavan 1987] Barring a few recent exceptions [such as Guha 1987 and Amin 1987] studies have only attempted to grasp the impact of the modern legal system on the Indian society Some interesting studies have tried to capture the societal reactions to the law and law enforcing agencies The point however is who made these laws? The state What constitutes a state a particular social formation If so the processes of formation of law its implementation and reactions cannot be discrete events in human societies

This note is a modest attempt to suggest an emergent frame of reference for a meaningful dialogue amongst the sociologists of law We have done it through a three layered argumentation first the frontiers of theoretical debates on law as a social process second a brief review of sociology of law with reference to India and third given the contemporary epistemological contributions to the sociology of law suggestions for intertwining of social relations and law And then with the example of agrarian legislations in India we conclude that newer explorations are made possible by the theories of discourse which require us to see law as dispersed power relations structuration and societal discourse

A starting point for the student of sociology could be the implicit assumptions/construction of society in a particular theory of law The conventional theories of positivism and structural-functionalism are inherently fallacious on this count Their construct of society is ultimately an assemblage of discrete autonomous and self referential entities such as individuals and institutions and related norms rules and social experiences History of changes in such discrete compartments are again an assemblage of autonomous events which are at best interactions amongst the actors and at the worst incidental and chancy

To be specific about law legal systems are seen as autonomous and independent operating with their own set of norms and rules The genesis of these norms and rules no doubt are seen in the society in general However once a particular system of law comes into existence, changes can only be brought about by external forces For example the indigenous legal system was changed by the Britishers in India In this theoretical construct there is no inthropological possibility of change in law and legal system without moving out of the self-referential systems of law and society

The first contentious issue therefore is whether law is a system at all for theorists to talk of legal system All jurisprudential theorists do believe in systems However they use legal 'system' to describe different things Hart (1961), for example sees the union of primary and secondary rules at the centre of the legal system Primary rules impose duties on human beings Secondary rules are rules about rules including rules which establish validity of rules and thereby a hierarchic structure of rules (rule of recognition), rules for changes in rules (rules of change) and rules for enforcement of rules (rules of adjudication)

Thus according to Hart, law is a self-contained system This would mean rules refer to other rules and their systematic interdependence determines the legal system Thus, in Hart's formulation a legal system somehow gets established and becomes a structure of authorising relationships In such a schema,the key role is given to the formal character of a legal system and a proper understanding of law should distinguish it from coercion and morality

There are still questions about law to be answered Like why some rules are accepted, laws get changed some laws are followed while others are not the same rules are interpreted differently by the courts, and the same rules acquire different meanings with changing contexts Hart, instead of facing the sociological questions, responds by creating the distinction between 'the core of settled meaning and penumbra of doubt' to assert that legal terms have a central paradigm which makes their meanings non-controversial

The shortcomings of these theories are that they remain trapped in the self-erected domain of law ' They are unable to explain not only dynamic social situations in developing countries but even normal events in the field of law itself Since law is constructed as an autonomous domain (with the reference frame of the state as sovereign and the courts as adjudicators), it may enjoy partial support in the developed world where courts are relatively insulated from day to day politics However in the Indian context, the delays in adjudication, the inability of certain classes to go to courts, the much publicised litigant nature of society and the power relations which deter/facilitate access' to the judiciary require one to go beyond this domain

Legal Pluralism/Legal Anthropology

Legal pluralists largely belonging to the group of legal anthropologists have made moves in this direction The central question they address is what happens to the traditional legal system when the modern state legal system is imposed on it In the positivist tradition, it was assumed that the rising modern system would eventually subsume the traditional economy politics and legal systems (so very imminent in Rostow's stages of development) But the legal theorists were confronted with a situation where the traditional system though encroached by the modern system, did not disappear Legal anthropologists addressed this question and their works are largely a reflection on the presumed co-existence of the two legal systems, that is, the modern and the traditional Both exist, but each gets modified in the interactive process [3]

The march of colonialism along with the industrial revolution in western Europe and positivist ascendancy of new-liberalism initiated a complex interaction amongst other societies To govern, one must understand the subject and hence legal anthropology's focus on native customs and law By the end of the 19th century, the westerners and the natives had come into contact for a long time and there was a process of modernisation of the tradition (as achievement) and traditionalisation of modernity (as problems to be addressed by sociology of law) This problem has to be understood more through a sociological prism rather than with anthropological tools [4] The problems of legislating, implementation

of laws, judicial systems, parochial forces working on and within the legal framework and the resistance of local/traditional variety to the homogenising effect of modern law (e g decades old problem of common civil code) led to enquiries into the interaction between the modern and the traditional law

In addition to the duality of customs as people's law, and the statutes as the law of the state, the studies on colonial societies detailed out another set of difference of indigenous legal tradition (custom and shastric text) and alien Anglo-Roman (western-modern) legal tradition coloured by the colonial regime The colonial rulers tried to build a judicial system which was modern in form and incorporated the native needs For the later part they elevated the textual law over customs through revival of the shastric scholarship It was in a way a continuation of modern jurisprudence which is textual On the other hand it was the only practical option Referring to customary law instead of shastric law would have meant the emergence of literally hundreds of different systems of customary law [Derrett 1968 317] which was against the standardisation and homogenisation so very essential for modern law This led to according to Rudolphs (1969) the creation of a dual legal system the western and the indigenous The legal system still exhibits different layers of cultural interaction and persistence namely the parochial brahmanical and the national It was akin to the processes of Sanskritisation and westernisation as their jural parallel In a somewhat more imaginative summary of this academic tradition Galli interdetails the complexities involved in such dualities and how in many ways it relates to the contemporary living experiences ranging from social relations and cultural and political processes And yet modern law has the hegemonic position in this duality [Dhavan 1989 lxix]

These studies made a significant advance by recognising the inevitability of ascendancy of modern law over the indigenous legal systems In addition Lingat (1973) invites our attention towards the essentially evolutionary process of textual law itself which incorporates from time to time customary law indicating the ingenuity of interpretation by shastric scholars At the same time, modern law acquires an indigenous character which enables it to be perceived by the natives as its own tradition However the relative positioning of the modern and the traditional in inherently burdened with conflicts The suggestion thereafter emerges that law as a social process has to be responsive to those it addresses By such liberal address, it acquires legality and legitimacy The process is on and hence legal pluralism

The point however is if the law in the native context was (and remains so in contemporary decades) an interaction between text and context, then the text is not a homogeneous entity and context is similarly not a frozen society By this logic modern law which was brought to the colonial fields could not have been a homogeneous one even at the level of the text Because one modern law as a process of interaction in the home country from where it is brought is a discourse incorporating contrast and conflicts and second its implication for the native society as a context cannot be even The native society as the recipient of an essentially tension ridden legal regime is again not a homogeneous entity It has its own tension ridden interaction between text and context Its response to the colonial regime and attendant modern law cannot be even In other words it is a complex process of multiple interaction amongst the native societies the text of modern law and the colonial regime To put it boldly there is no such thing therefore as status-contract, formal informal tradition-modern and great little These stand questioned by the argument of the legal pluralists themselves (logically and not simply empirical derived) that law is not a self referential system but emerges from interactions in social discourse [6]

Law as Discourse

Legal pluralism critiqued positivism, by maintaining that rules emerge from the interaction of cultures The view nevertheless accepted that rules decide concrete cases Critical legal studies took it further by positing that law is enmeshed in power relations and inequality in society Thus, the application of law is contradictory and inconsistent largely governed by the politics of ruling However, against the over contextualisation of law the critical legal studies, it must be noticed that law, once formed affects social relations Thus law, despite its enmeshing in power relations, is relatively autonomous, relative because in the process of modulating the social relations, law itself undergoes a change

The relative autonomy of law, therefore, re establishes the importance of the legal text which provides a special meaning and effect However the text, a reflection of power inequality and resistance in society, is a contested domain The law is read and enlivened by the social actors in the reference frame of their contexts It would imply that all texts are unstable in their meaning [Derridda 1976], or the meaning of the text varies with the relevant 'community of interpretations [Fish 1980] If all texts are burdened with the possibility of multiple interpretations, then what provides authoritative interpretations of law? Interpretations are supplied by the context (Foucault's micro politics and power as dispersed relation), and these are locked in the hegemonic process to establish themselves as the authoritative one The process of authoritative interpretation necessarily involving the strategy of conceptual neatness, appeal to shared values, homogenisation and universalisation In other words, 'legitimate' legal interpretations (of the text and the application, both) are only 'interested' articulations Thus, law is a social discourse

This conceptualisation of law is related to the theories of discourse which are based on the premise that society is a dynamic interplay between social action and social formations (discursive structuralism) There is a connection between the daily practice of social actors and the larger structures These structures are a set of inevitability in which social actors find themselves, resist, change and therefore, reconstitute Thus, social structures are created by the social actors over a period of time by reproducing meaning with the imprint of power Like social structure, law is both the pre-condition and result of social practices "Constraining and enabling the human agency, the law comprise generative rules and relationships that social actors use strategically to make their way in the world" [Giddens as read by Scheppele 1994 399]

Let us take the example of land legislations in India[7] to highlight the above outlined theoretical transition in the sociology of law The early studies on law and social change during the colonial rule in India were dependent on the modernisation framework and Sir Henry Main's 'status to contract' [Main 1861 165] It was argued that 'the introduction of rational system and private property was accompanied by intensive codification and differentiation of legal norms, establishment of modern judicial administration [Singh 1978 145-46] Some studies [such as Jain 1972] sketch the chronological details of the courts and judicature in British India

A shift came with the studies on land reforms and peasant movements These studies led to a re-examination of colonial policy and agrarian legislations and their effect on social structure, differentiation within the peasantry, contradictions and resultant peasant movements Eric Stokes (1959) traced the principal ideologies behind different property legislations Ranajit Guha analysed the role of ideologies in shaping the policy of permanent settlement and concluded that "the recognition of property as a basic principle of government was the common measure" [Guha 1963 18] Ravinder Kumar (1968) studied the impact of ryotwari settlement in Maharashtra He analysed the changed contours of land legislations in a particular social structure and its effect on different classes

In an important work, Neale (1962) analysed the land tenures in United Provinces as created and modified by a century and

halt of the British rule For him, the gaps between law and reality were not due to bad legal framework of tenure but because of the nature of the Indian society itself Raj (1965 and 1978) has analysed the background of various agrarian legislations in UP starting from the British annexation of Awadh in 1856 and its effect on various strata of peasantry Metcalf (1979) maintained that the colonial state's first priority was political stability for economic benefit and thus, the accommodation of the taluqdars' through the Taluqdari Settlement This led to assistance from subordinate zamindars and thus to the amendments to grade the property in land according to the strength of the claimants Another study analysing the relationship between the landlords and the British administration has shown that the Oudh Policy was constantly modified under pressure of increased discontent [Reeves 1963]

Elizabeth Whitcombe (1971) noticed that the modernisation of the law meant an increase in judicial facilities But the legal confusion (increased litigations fraud and the social disruption) prevalent at the end of 19th century was caused by one ground realities in the rural areas and two overlapping jurisdictions of courts technical complications of law and the relative impersonality of the modern courts

The above survey of the studies demonstrates that the emphasis has been on the impact of agrarian legislations on the socio economic development and vice versa It is argued that the British rulers influenced by utilitarianism (though partly debated by Guha 1963) initiated a process of change from status to contract by removing obstacles to the free market (modern legal system) Another interpretation of the same process has been that the introduction of private property has had a direct bearing on India's underdevelopment Thus the operative legal norms are generally derived from textual analysis and then incorporated into the contextual description as impacting on general socio economic fabric There exists a gap in the analysis of property laws and agrarian relations as a social process with due emphasis on the dynamic inter link between the law in the books and the law in action [Das 1974 369-73] Secondly, the legal texts have not been analysed in terms of contested terrains Third the discourse between contested text and social context is largely missing This has perpetuated a notion of enforcement of a modern/bourgeois property law in a traditional social structure For us this is only one reading of the text and the context The possibility of conflicts imply multiple readings and usage of the fluid text in a changing context This calls for the analysis of agrarian legislations and relations afresh

An attempt in this direction in analysing the evolution of colonial property law and agrarian relations in India has been fruitful With British rule, a new set of property laws were devised and continuously modified The property laws had more than one set of legal norms and thus, left room for ambiguity and manipulations The contested texts were both product and cause resulting in fluid operational norms

The process of evolution of law through legal disputes and related social changes led to original categories and codes being redefined into a different set of legal norms When codified laws as enacted resulted in altering the existing property arrangements, new varieties of agrarian conflicts ensued These actual conflicts were more wide-ranging than perceived in law-making pre-emptions The contending parties, fighting for their claims tried to register their rights or claims in the new legal format through the courts At the time, the judicial authorities had to interpret the existing sections of particular law in terms of the real situation of conflicts

This two-way process led to an interaction between existing relations and imposed relations where (a) the codes and norms of agrarian property were redefined in terms

of imposed laws, and the laws were to be adjusted and modified according to the categories of the claimants. Thus, the agrarian legislations represented the culmination of compromises and failed to elaborate bourgeois notion of private property (much accepted and perpetuated in historical and sociological studies). The laws, thus, proved to be janus-faced with a pretension of bourgeois property [Pandey 1989]

As social change/reproduction is not effected by any single social stratum in isolation, different strata perceive social forces differently, depending upon their location in the existing order, and attempt to modify them. Evolution of law is a part of this social process, i e, structuration. The 'text' of law itself is a register of these negotiations, and therefore a contested domain. This is in addition to the discourses out of the text (the actual working of the law). Therefore, the analysis of the text and its working are enmeshed in the sociological set of legal relations." Das had called our attention to this sociological agenda of research on law 20 years ago. Baxi re-emphasised the need to remove this poverty. The above summary rearticulates the gap and the desire to make sociology of law sociological.

Notes

1 Any understanding of social processes is particular to a production relation, as the unit of analysis. And yet it is universal in theoretical re-construction on the basis of basic ontological premises about the human beings, relationships and social reflexivity. Thus, the basic slogan of post-modernity debate, which calls for abandonment of grand theories that thrive on modernity's impulse of homogenisation and universalisation, is 'Think globally, Act locally'!

2 Attempts to salvage the impasse, by theorists like Dworkin, took it out of the morass of positivism only to run into another normative blind alley [Douzinas et al 1991]. Another tradition of law is the 'autopoetic system' propagated by Luhman [King 1993]. At one level, it is an advanced version of structural functionalist theoretic. Luhman describes law, for that matter any field like politics, economies, etc, to be a self-referential domain. Law can express itself only in its own language. For example, only when the agrarian relations pose themselves as legal problems do they enter the domain of law. Though burdened with the dangers of asociological textualisation of law, the perspective cannot be trivialised. Because of its correction of over-socialised explanation of critical legal studies, it provides functional guidelines for integrating the domain of legal text as relatively autonomous from social relations.

3 This was because anthropology was rooted in understanding the other cultures, the traditional societies were in majority the major sites of fieldwork. In the process, it looked back at the legal positivism of Hart and questioned it by another set of constructs commonly known as legal pluralism, even for home countries.

4 Though one would like to claim that the conscious and subconscious motive remain similar – how to govern better.

5 The tradition of formal-informal law has been severely criticised in the pages of *Journal of Law and Society*, Vol 20, 1993.

6 In Gramscian moments, particular social formation and its representative state, and for post-modernism the modernity.

7 It is a known fact that the colonial regime initiated modern land legislations in the Indian sub-continent. However, it is equally important to emphasise that almost every decade of colonial rule had witnessed enactments, amendments, peasant/tribal uprisings, negotiations and further enactments/amendments. The process continues till date, if we carry the arguments to post-independence era.

8 We undertook the study of agrarian legislation in colonial Awadh (1856-1920). The study focused on the following questions: (i) The nature of property laws as a set of theoretical pronounced prescriptions, internal coherence and contradictions by de-constructing the text, (ii) the actual working of the laws through an analysis of court cases – (a) a reconstruction of the relations in the line of new hegemonic strategies; and (b) alterations of the hegemonic strategies in the line of social relations; and (iii) the emerging legal norms; categories and relations [Pandey 1985].

9 Conceptualisation of logic and structure of this operative legal norms is possible through actual dispute cases which are brought forward by various participants. Relative success and failures of certain classes to register their rights or claims, would also reveal the protection offered to certain interest (and rejected to others) disclosing the logic of legal framework. Thereby we can also discern historical foundations of the nature of agrarian uprisings. This in turn, initiated the changes in legislations and the resultant formulations of legal norms through enactments, interpretations and litigations.

Pakistan's Courts and Democracy

A G Noorani

Judging the State: Courts and Constitutional Politics in Pakistan by Paula R Newberg, Cambridge University Press Cambridge UK 1995, distributed in India by Foundation Books, Delhi, £ 35

FOR reasons hard to understand, while the superior courts in Pakistan cite Indian judicial precedents the Supreme Court of India does not return the compliment with the exception of the Bommai case last year Indian impressions of the performance of courts in Pakistan tend to be negative without qualification Considering how the Supreme Court of India collapsed morally in the habeas corpus case in 1976, during the Emergency and one of its high-profile judges – P N Bhagwati, the darling of the ignorant section of the Left – wrote an abject letter of congratulations to Indira Gandhi, no sooner she returned to power in January 1980, no Indian ought to sneer at judges in Pakistan who have faced repression and dictatorship for worse than the Emergency in India

Paula Newberg's superb book should provide the corrective She records all the surrenders and betrayals as well as instances of courage If she had done no more than simply provide a resume of the great cases, from Maulvi Tamizuddin Khan's in 1953 to Nawaz Sharif's in 1993, she would have put students of Pakistan s political and constitutional system in her debt She has, however, related each case to its political setting and provided her own interpretation The reader may or may not agree with her But the references are specific and one can consult the case for oneself No one landmark is omitted

The scope and object of the work are best stated in the author's own words 'This study explores relationships between state and civil society through the medium of the superior judiciary It shows how, over the course of almost five decades, the courts have influenced the development of its constitutions and the structure of the state By examining judicial decisions, particularly at times of political crisis, it isolates discussions about concepts of constitutional rule between the judiciary and other institutions and looks at the way tensions within the judiciary and between courts and other state institutions have affected the ways that political society sees itself And finally, it explores the consequences of these debates for the formal organisation of political power

The book has neither heroes nor villains, although some will seem to emerge It chronicles the ways the state s has been viewed by one of its own institutions and the intricate ways that sitting in judgment has affected courts and constitutions and state and society"

The theme is well developed The moral dilemma facing the judges is clearly spelt out There are some flaws and blemishes, in style and substance At some places the language is either sweeping or imprecise and vague It is surely wrong to assert that through the 1950s when there was no Constitution Before the Constitution of 1956 overturned by the coup of 1958, Pakistan did have a Constitution, as India had from August 15 1947 to January 25 1950 – the Government of India Act, 1935, as adapted by each country

No one who has read Jinnah's speeches will agree with the author that "his vision for a democratic Pakistan had been a largely formalistic one" A scholarly work should quote his famous speech at the inaugural meeting of the Constituent Assembly on August 11, 1947 instead of referring to Mohammed Ali's invocation in 1954 of the "rhythms of Jinnah's plea for non-sectarianism in the first Constituent Assembly" and quoting his quaint paraphrasing of that speech

Also, it is wrong to say that under the 1956 Constitution the president's "executive powers outreached those of the elected prime minister' As a matter of fact, Clauses (6) and (7) of Article 37 made the cabinet's advice to the president, through the PM, binding on the president in terms more explicit than those in the Indian Constitution enacted in 1949 Not till the 42nd Amendment, enacted in 1976 during the Emergency, did the Indian Constitution so explicitly bind the president as did the Constitution of Pakistan in 1956 Missing in the Indian Constitution still is the explicit injunction in the 1956 and 1973 Constitutions of Pakistan that the PM may not be dismissed without a vote of no-confidence by the National Assembly

What has emerged today in Pakistan is an activist judiciary By 1993, "almost every major political issue in the country found its way to the courts" But the Supreme Court went through a lot before reaching the present state It twice validated a military coup in 1958 by Ayub Khan and in 1977 by Zia ul-Haq In between in 1972 it had rejected the 1958 ruling and held that Yahya Khan s coup in 1969 was illegal, only to cave in in 1977 "Their judgments have often supported the government of the day, presumably to retain a degree of future institutional autonomy"

In Maulvi Tamizuddin Khan's case the Supreme Court of Pakistan upheld the dissolution of the Constituent Assembly in 1954 by the governor-general, Ghulam Mohammed, on manifestly political grounds – which chief justice M Munir did not try to conceal – over the vigorous dissent of justice A R Cornelius Kenneth Diplock, QC, later a distinguished law lord appeared for the GG He was aided by Ivor Jennings who never forgave India for not soliciting his legal assistance as Ceylon, Nepal and Pakistan had done If Diplock's argument, which Munir readily lapped up, was right, the Indian Constitution is 'illegal' because it did not receive the assent of the governor-general Rajaji, but only of the president of the Constituent Assembly, Rajendra Prasad

Munir was even rude to the Sind High Court, which had ruled to the contrary, saying that the Supreme Court could derive no assistance from its judgment In 1958, in Dosso's case, he validated the military coup "A victorious revolution or a successful *coup d'etat* is an internationally recognised legal method of changing a Constitution" The court based its judgments on a theory propounded by the jurist Hans Kelsen in his work *General Theory of Law and State* (1945)

This ruling was reversed by the court in April 1972 in Asma Jilani's case when it held that "looked at either from the Constitutional point of view or the Martial Law point of view, whatever was done in March 1956, either by Field Marshal Mohammad Ayub Khan or General Agha Mohammad Yahya Khan, was entirely without any legal foundation" The court observed that Kelsen's view was not universally accepted as a theory Still less could it serve as a foundation for a legal judgment It was a theory of the law, not the law itself

In Nusrat Bhutto's case (1977) the court validated Zia's coup But while chief justice Munir accepted the Ayub take-over simply as a *fait accompli*, chief justice Anwarul Haq accepted the Zia take-over approvingly while formally rejecting the Dosso ruling.

His political predilections were obvious "There was thus a serious political crisis in the country leading to a breakdown of the constitutional machinery insofar as the executive and the legislative organs of the state were concerned A situation had, therefore, arisen for which the Constitution provided no solution" Hence the army's

intervention which the chief justice willingly certified, "was spontaneously welcomed by almost all the sections of the people"

Anwarul Haq loathed Bhutto and publicly attacked his rule in a speech delivered on September 24, 1977, an impropriety which should have debarred him from hearing the above case as well as Bhutto's appeal against conviction of murder

The chief justice tried to preserve some remnants of the rule of law in a dictatorship The Supreme Court's judgment was delivered on November 19 1977 By then the general had gone back on his promise to hold elections on October 18 and postponed them indefinitely The judgment recorded "After seeking instructions from his client, Mr A K Brohi has informed the court that the Chief Martial Law Administrator intends to hold election as soon as the process of the accountability of the holders of public offices is completed and the time factor depends upon the speed with which these cases are disposed of by the civil courts concerned

'The learned Attorney General has stated at the bar that in his opinion about six months is needed for this purpose and thereafter it will be possible to hold the elections within two months

The assurance was violated to no one's surprise The court did envisage such a situation when it said that while it did not consider it appropriate to lay down a time table for elections it would like to state in clear terms that it has found it possible to validate the extra constitutional action of the Chief Martial Law Administrator not only for the reason that he stepped in to save the country at a time of grave national crisis and constitutional breakdown but also because of the solemn pledge given by him that the period of constitutional deviation shall be of as short a duration as possible, and that during this period all his energies shall be directed towards creating conditions conducive to the holding of free and fair elections, leading to the restoration of democratic rule in accordance with the dictates of the Constitution'

Meanwhile, the Supreme Court was careful to emphasise, 'the power of judicial review to superior courts continue to have to judge the validity of any act or action of the Martial Law authorities if challenged in the light of the principles underlying the law of necessity as set out in this judgment" The court, of course, did not pursue the matter even when Zia's breach of the assurance had become blatant and incontestable

In both cases, the chief justice knew he was submitting the judicial office to the wishes of the man on horseback but tried to salve his conscience Evidence has come to light of Munir's complicity in the elimination of the office of president in 1958 by Ayub Khan

There were judges like Justice Z H Lari who was known for his independence even as a Muslim League leader in UP before partition and M R Kayani who spoke out courageously, as did in the 1980s, justices like Dorab Patel, Fakhruddin Ebrahim who once practised in the Bombay High Court, and Mir Khuda Baksh Marri They remained true to their oath of office Lawyers like A K Brohi, a shining light of both the Congress for Cultural Freedom and the International Commission of Jurists, and Sharifuddin Pirzada supported every military dictator There were those like Mian Mahmud Ali Kasuri who resigned as law minister in the Bhutto government and as a member of the Constitution Drafting Committee rather than be privy to the 1973 Constitution which made the prime minister all-powerful The author records that "despite constraints on their activities, bar councils agitated for an end to martial law"

In the last seven years, among the more notable cases decided by the Supreme Court are Benazir Bhutto's case (1988) on a political party's right to contest elections without being registered with the Election Commission, Haji Muhammad Saifullah Khan's Case (1988) decided after Zia's death in August 1988, holding Zia's dissolution of the National Assembly and of the provincial assemblies by their governors in May 1988 to be unconstitutional, and the Nawaz Sharif Case (1993) in which the dissolution of the National Assembly and Sharif's dismissal as prime minister were not only held unconstitutional, but both the assembly and the PM were declared to have stood restored and entitled to function as before – an order never before made by any superior court

The Zia legacy is yet to be dismantled completely Let alone the Eighth Amendment of 1985 many a repressive law continues to disfigure the statute book However, the press is free and so is the judiciary, though Benazir Bhutto has begun to pack the courts It would be fascinating to watch how the courts perform their constitutional role in the days to come

Paula Newberg's detailed analysis of the march of case law, spread over four decades, is of absorbing interest to constitutional lawyers and political scientists alike Her able work brings home to an Indian reader the enormous and yet untapped legal resources that lie in Pakistan which Indian lawyers can draw upon if Indo-Pak exchanges in this field are encouraged and institutionalised

Concept

ENVIRONMENTAL ETHICS

A Dialogue for Cultures

R. P. Misra (Ed.)

Hardbound Rs 350

This volume is the outcome of a symposium on Environmental Ethics It presents in summary the ethical values prevalent in different cultures and societies and the potentials of these values to ward off the emerging environmental crisis in the world Science and technology cannot to blamed for all the ills of the society Much depends on how we use them How we use them depends on our value system, which in turn determines the ethical code Environmental ethics cannot be imposed by law It has to be articulated systematized, condified and followed by each and every individual This needs comprehensive senstive education policy in each and every country of the world

Prof. R. P. Misra is currently associated with the Department of Geography Delhi School of Economics, Delhi

DCM SHRIRAM CONSOLIDATED LTD

Shri Mantosh Sondhi

Speech by Shri Mantosh Sondhi, Chairma at the Annual General Meeting of the Company held on August 3, 1995 at New Delhi

Ladies & Gentlemen,

On behalf of the Board of Directors and on my own behalf I extend to you all a very warm and cordial welcome to the 6th Annual General Meeting of your Company The Notice convening the meeting, the Directors Report and the Audited Accounts for the year ended March 31, 1995 have been with you for some time now and with your permission I shall take them as read

The Economy

May I now say a few words about the economy Economic growth during 1994-95 on all fronts has been very satisfactory GDP grew at a rate more than 5 percent, as estimated Industrial growth at around 8 percent has been very reassuring Corporate results have been extremely good And so has been the Government revenue both from direct and indirect taxes, if the present trend of revenue collection continues for the rest of this financial year, it will greatly help to reduce the fiscal deficit even if the Government is unable to control its expenditure Foreign current assets on 16th June, 1995 at US$ 19 7 billion were substantially higher as compared to US$ 16 1 billion on 17th June, 1994 Grain production in 1994-95 placed at 190 million tonnes is 4 7 million tonnes more than what had been estimated earlier In short, the economy is well poised towards higher growth, the only gloomy shadow looming large on the horizon is cast by the severe liquidity crisis Government's anxiety to contain inflation in a pre-election year is understandable At the same time, lack of funds when the economy is booming can be counter-productive It is hoped that the RBI and the Government will find a reasonable via-media before the present momentum in industrial growth begins to taper off, failing which the projected industrial growth of 10% during the current financial year will not be achieved

I would also like to emphasise that much greater focus must be placed on the development of infrastructure which, as all of you know, has already become a major constraint There has been much rhetoric on the subject with little action Simultaneously, outdated laws and regulations like Urban Land (Ceiling & Regulation) Act should be scrapped or substantially modified to meet the changed situation In fact there should be quick review of all old and archaic laws as stated by the Finance Minister in his budget speech last year

Review of Operations

During the year ended March 31, 1995, sales of your Company at Rs 607 99 crores were higher by 21% compared to sales of Rs 502 40 crores in the previous year The gross profit also rose by 61 3% to Rs 43 01 crores from Rs 26 66 crores in 1993-94 The net profit shot up by 90% to Rs 28 73 crores as compared to Rs 15 15 crores in 1993-94 All the units performed well and contributed towards this excellent performance Your Directors have already shared with you fruits of better results by declaring an interim dividend of 15% during the financial year under review The Directors have now recommended a final dividend of 20%, thus making a total of 35% for the full year

A. Fertilisers

During the year, the operations of this Division improved significantly and achieved higher production levels as compared to the last year The Division received "Best Productivity Performance in Fertiliser Industry in India" award by the Fertiliser Association of India for the year 1993-94 Although the Government of India notified urea retention price effective from 1st April, 1991, only part of the pending claims were cleared towards the end of the financial year This has adversely affected the cash flow and consequently the profits

B. Plastics & Chemicals

In the case of PVC, domestic availability is in excess of the demand due to commissioning of new capacities Consequently, possibilities for exports were explored and in fact, it has been possible to make a small beginning in this direction Our technical collaboration with M/s Zeon Kasei Co Ltd of Japan has helped to improve the quality of our PVC compounds

Production of caustic soda and chlorine was the highest ever, but reduction in customs duty depressed the market

SHRIRAM UREA • SHRIRAM DAP • SEEDS • PESTICIDES • CHEMICALS

sentiment Besides, unfortunately, a fire broke out in the Rectifier/Transformer installation of the caustic soda plant in April, 1995 However, I have to report with a great deal of satisfaction and with pride that this installation was made operational within a period of 28 days, an achievement which I can say without any fear of contradiction could not have been matched anywhere else taking the totality of circumstances into account The whole operation was planned meticulously and executed with military precision The credit for this goes to our senior management team at Kota who were so ably led by Mr Ajay Shriram and Mr Vikram Shriram to overcome a situation which was nothing short of a major crisis Although this breakdown has had an impact on the performance of the caustic soda plant during the first quarter (April-June), we hope to make up the leeway during the remaining period of this financial year and reach the budgeted figure As a part of this exercise maintenance shut-down planned for the later part of the year was taken up during this period

C. Power

Performance of the captive power plant continued to be extremely satisfactory during the year The Company has also successfully commissioned the 30 MW power plant This has increased the in-house power generation capacity to 75 MW

D. Cement

Operations of cement plant were the highest ever - both in terms of production and efficiency The Unit received National Award for 'Best Improvement in Energy Performance" jointly given by National Council for Cement & Building Materials and the Ministry of Power for the year 1992-93

E. Textiles

Increase in cotton prices and restrictions on exports increased to some extent the losses of the Unit during the year However the company's textile business which is now much reduced is on the whole on a more effective footing

Environment

Shriram Environment & Research Centre at Kota recognised by the department of Science & Technology set up to carry out research and development work in the field of environment is doing reasonably well

Subsidiary Companies

DCM Shriram Credit and Investments Ltd (DSCIL), fully owned subsidiary of your Company, is progressing satisfactorily However, in case of other subsidiary, DCM Shriram Aqua Foods Ltd (DSAFL), work at the site has come to a standstill due to the recent Supreme Court interim order directing that no part of agricultural land be converted into commercial aquaculture farm

New Business Development

As a part of diversification programme, as mentioned to you last year, your Company had decided to set up a 150 tons per day capacity Chlor-Alkali plant at Jhagadia, Distt Bharuch, Gujarat The project is progressing as per schedule, and the plant is expected to be commissioned by the end of the current year Your Company is also actively pursuing investment opportunities in the power sector in various States The Company has already submitted proposals to Rajasthan State Electricity Board (RSEB) & Haryana State Electricity Board (HSEB) for setting up DG set based power plants of 100 MW each The Rajasthan State Government has shortlisted our Company for two locations

Your Company has also signed a Memorandum of Understanding with Royal Insurance plc, one of the three largest insurance companies in the U K ,to set up a joint venture for entering the insurance business in India as and when the Government policy permits this While it is difficult to say as to when actually the Government will open up the Insurance Business to the Private Sector, it looks that the Government will set up a Regulatory Body for this purpose before the end of the current calendar year

Rights Offer

The Company s Rights Issue of FCDs and NCDs with detachable warrants to its shareholders received overwhelming response and was oversubscribed

Industrial Relations

The Company continued to maintain harmonious and cordial relations with its workers in all its divisions, which enabled it to achieve higher performance levels on all fronts

Human Resource Development

The progress of the Company during last five years is in a large measure due to the quality of our human resources New challenges and additional responsibilities have been accepted by one and all with a great deal of enthusiasm and with a full sense of commitment Your Company fully realises the need of human resource development and is actively working on providing training inputs to all its employees

Prospects for the Current Year

In the first three months of the current financial year i e April to June, 1995, sales of your Company at Rs 141 7 crores are higher by 2 31% as compared to sales of Rs 138 5 crores in the previous year This modest increase in turnover is inspite of the fact that the maintenance shut down of caustic soda plant planned for later part of the year was advanced to April/May, 1995 to coincide with the recommissioning of Rectifier / Transformer installation of the caustic soda plant I am quite optimistic that this financial year will end on a better note both in terms of sales and profitability barring some unforeseen circumstances

Acknowledgements

Ladies & Gentlemen, in conclusion I would like to compliment the Management Team of your Company for their excellent performance The Directors also wish to thank the Government authorities, financial institutions bankers, business associates and shareholders for their co-operation and support extended to the Company The Directors also place on record their deep appreciation for the contribution made by employees at all levels to improve the working of the Company

Thank you

Note This does not purport to be a record of the proceedings of the Annual General Meeting

Macroeconomics in India

Ashima Goyal

Macroeconomics edited by Prabhat Patnaik, Oxford University Press, Delhi, 1995, pp 247, Rs 375

TO make research on Indian themes accessible to the student is a laudable objective It carries with it a heavy responsibility of being balanced comprehensive and readable In that respect there are both negative and positive aspects to the timing of the book under review The reforms have focused attention on macroeconomics A clear understanding of the way in which they interact with the structure of the economy is essential for their success The book offers a platform to develop this understanding Unfortunately given the sharp differences between schools of macroeconomics the conjuncture makes it all the more difficult to desist from polemics Most of the authors represented in the volume do manage to resist the temptation Occasional lapses are perhaps inevitable

Prabhat Patnaik in his overview points out the three ways in which Indian macroanalytics has been distinctive the seminal role given to agriculture public investment and the focus on the closed economy He does not sufficiently bring out the reverse flow In what ways has Indian macroeconomics contributed to major macropuzzles? I give two examples After the oil shocks of the 1970s mainstream macroeconomists discovered that they had neglected the supply side In India there was a rich literature covering the ramifications of supply constraints from agriculture and infrastructure interacting with demand It can be argued that macropolicy in India understood Keynes recommendations better than they have been in the west Here the budget deficit was always linked to public investment Keynesian pump priming did not mean fuelling consumption expenditure, and then blaming Keynes for the resulting inflation Today in following IMF-inspired policies we are in danger of forgetting this

Reading Patnaik it is obvious he must be a good teacher There is the sure development of the debate on the terms of trade, the relish in the cut and thrust of argument, the bringing out of the sudden insight For example Rakshit's realisation that in India agriculture served the same function as money did in Keynes' theory preventing the full utilisation of capacity He also points out areas where there are gaps in understanding such is the role that money plays in the Indian economy A fruitful area for future research

In such a sweeping overview however it is easy to find counter-arguments for particular statements Take the following one In IMF type reforms the argument is often made that protecting public investment is compatible with a reduction in the fiscal deficit if privatisation is undertaken This Patnaik writes is logically untenable because if the purchase is financed by taking a bank loan and banks are carrying excess reserves there is no reduction in ex ante absorption in the economy Now the full blooded IMF type argument is always to use the sale of public sector enterprises to retire public debt As interest payments fall the fiscal deficit would be reduced Those who argue that the proceeds be used to raise public investment do so precisely because they do not want to reduce absorption They are aware of the difficulty the government has in raising finances that private investment often falls during reforms so that it is all the more essential to protect and even raise public investment Externalities carried by investment can then help to speed the growth process Rising taxes efficiency returns from successful restructuring and financial deepening would in time improve the fiscal deficit

The assertion Patnaik makes that foreign direct investment unless it is for export would substitute one for one with domestic industry is also questionable Even if in the worst case Parle sells out to Coke the former could be investing elsewhere

In Indian theorising the rest of the world was largely ignored This book meets a topical need by having two chapters that very capably cover relevant work in this area Amitava Krishna Dutt takes a number of different approaches and models that can shed light on open economy issues for India He first presents the theory then empirical applications and last criticism The penultimate section comments on the policy issues currently facing India in this area An ideal format but unfortunately a bit enthusiastically carried out Only a very diligent reader would persevere through the empirical sections A stray remark betrays a lack of understanding of the Indian economy Dutt justifies the absence of inflation in a model by saying that is it is low in India inflation can safely be omitted The reverse is true Understanding why inflation is low can unravel many microeconomic knots for India

Chandrashekar Gulati [illegible] theoretical frameworks underlying adjustment policies His understanding and debunking of the mainstream (Polak Khan Knight, Khan-Monteil) models are very thorough He ends on a gloomy note seeing modern governments as puppets in the hands of finance capital

Amiya Bagchi discusses mainly closed economy structuralist macromodels for India in his chapter, but betrays a pleasant openness and a depth and modernity of reading He notes that the literature on growth-oriented open economy structuralist models is as yet limited In India, the labour market money asset choice and expectations have been relatively neglected He laments the bewildering array of combinations possible in structuralist models, and therefore the need to study the proximate causes of rigidities In conclusion he says that it is essential to move beyond the earlier discussion of import and export elasticities to understand and harness the international movement of capital keeping strategic and political economy considerations in mind

The idea of initiating a debate on the role of the state as seen from different theoretical perspectives and from the Indian macroeconomic experience is a good one Jayati Ghosh has a useful and well researched classification of the state as (1) an interloper putting snags in the smooth functioning of markets (2) an instrumentalist *deus ex machina* for stabilisation or development, (3) an intermediary reconciling claims of different interest groups and (4) incorporative — an interactive view of the state society institutions and dynamic processes She concludes by supporting the Kaleckian incorporative state

While philosophically sound, this approach is too general to provide useful instructions for studying the real world It shares this drawback with Walrasian general equilibrium analysis For Ghosh the left is clearly right ' despite the veneer of objectivity which theories may possess, they are actually crucially affected by [social and material conditions]" (p 180) Carried to its extreme this idea would belittle her own considerable academic effort The question goes deeper than the role of the state and can be posed as follows Do ideas have a teleological function? If nobody can be objective and ideas can have no influence in shaping the world why think?

Dutt points out that proper understanding and evaluation of issues requires an internally consistent theoretical approach He suggests a creative adaptation of western models V N Pandit provides the riposte that a neat algebraic model by itself can do as little as haphazardly put together facts An analytically based knowledge of

relevant parameters is required. In the interaction between agriculture, industry, inflation and investment. It is unlikely that policies that do not make use of this knowledge will work.

The earlier isolationist policies are no longer viable because of genuine changes in the structure of international interaction. Even if the ideal situation is for exports to rise while imports remain restricted, remittances by Indian workers abroad have made smuggling easier and import controls more costly. The corruption, delays and even sheer terror associated with the bumbling hand of bureaucracy cannot be discounted.

It would be naive to ignore the realities and arrogance of power but the best antidote is countervailing economic power. South East Asia and now China show that this is possible. It is argued that different initial conditions make it difficult for India to replicate the success of these countries. But insofar as it was based on (1) leap-frogging a technology gap and achieving international quality and (2) a change in international capital flows with capital flowing to areas of plentiful labour and high demand, India would seem to have more than a chance. Supportive policies to minimise problems associated with foreign inflows would be necessary. Even so, seeing exploiters everywhere could mean missing a possible friend. Countries with higher capital intensity have higher average living standards and more equality of opportunity. Long ago Lewis pointed out the benefits of trade, exposure to best practices and ideas. Freedom need not necessarily mean more consumption, it can also mean more earning and learning.

The devotion to India's development and concern about the exploitation of the poor in the book are commendable. For some authors it may have meant forsaking greener academic pastures and countries. The solutions to the problems, however, are still not obvious. It is necessary to be forward looking and to leave the comfort of an academic cocoon.

Patnaik pre-empts criticism by pointing out that there are gaps in the book. Survey of work on the labour market, pricing and money is missing. Possibly this will be made up in future volumes. The gaps in the classified bibliography are, however, inexplicable. For example the section on money has no reference to Chitre's or Nachane's work.

NEW FROM SAGE

ALIEN CONCEPTS AND SOUTH ASIAN REALITY

Responses and Reformulations

T K Oommen

In this thought-provoking book, the author demonstrates that Indian social science is not a mere captive of Western or Marxist theories and concepts. The essays in the first part present a response to five important Western/Marxian theories and concepts. In the second part he reformulates some of the theories and concepts. Innovative, synthetic and bold, this important volume will be essential reading for social scientists of all hues and levels and from all parts of the globe.

SHIVA'S OTHER CHILDREN

Religion and Social Identity Amongst Overseas Indians

David James Mearns

This book combines the anthropological-ethnographic approach and applies it to social analysis through an examination of theoretical issues in the study of urban processes and religious practice, focusing particularly on the group labelled 'Indians' in Melaka, Malaysia. An important book that fills a gap in our knowledge about overseas populations in Asia who identify themselves as originating from the Indian subcontinent.

KARNATAKA STATE FINANCIAL CORPORATION

Shanakaranarayana Buildings, 25, Mahatma Gandhi Road, Bangalore - 560 001

Shri B K Bhattacharya, IAS
Chairman

Dear Friends,

It is my pleasure once again to meet you all I welcome you to the 36th Annual General Meeting of your Corporation I am happy to report that the Corporation has made a successful entry into new business areas covering merchant banking, hire purchase, corporate loans, bill discounting and deferred payment guarantee Your Corporation has once again performed exceedingly well in surpassing targets in all key operational areas.

MILESTONES

Sanctions crossed the Rs 500 crore mark in 1994-95, while disbursements crossed the Rs 400 crore mark The Corporation recovered Rs 374 83 crores in 1994-95 The cumulative number of loans sanctioned crossed the one lakh level In the rehabilitation of sick units the share of the Corporation is 45% of the number of units covered by all SFCs in the country For three years in a row, the Corporation has been recognised by the IDBI as the preeminent SFC in the country in all operational areas.

WORKING RESULTS

During the year under review, the Corporation generated a gross revenue of Rs 190 62 crores on cash basis as against Rs.148 76 crores in 1993-94

The working of the Corporation in 1994-95 resulted in an operational profit of Rs 36 06 crores before write-off and taxes

OPERATIONAL HIGHLIGHTS

The performance of the Corporation against targets set for 1994 95 is given below

(Rs in crores)

	target	achievement	% of achievements over targets
1 Sanctions	398 50	520 18	130 53
2 Disbursements	353 50	432 09	122 23
3. Recovery	343 00	374.83	109 28

REHABILITATION OF SICK UNITS

61 units were provided rehabilitation assistance of Rs 3 29 crores With this, the total assistance since the inception of the scheme touched Rs 64 28 crores in 1462 cases

ASSISTANCE TO THE SMALL SCALE SCALE SECTOR

Rs 289 61 crores were sanctioned to 7839 cases during the year as compared to Rs 208 16 crores last year Cumulative assistance to SSIs at the end of March '95 stood at Rs 1607 99 crores in 67732 cases Cumulative assistance under the Vishwa programme stood at Rs 23 20 crores in 15,507 cases

EQUIPMENT LEASE FINANCE

The Corporation sanctioned Rs 11 88 crores in respect of 23 units as against Rs 4 04 crores in the previous year Disbursements amounted to Rs 9 89 crores (Rs 2 00 crores in 1993-94) and recovery was 100%

HIRE PURCHASE

In the first year itself sanctions under hire purchase came to Rs 15 67 crores and disbursements to Rs 9 87 crores

MERCHANT BANKING AND FINANCIAL SERVICES

Merchant banking activity was started in the second quarter of 1994-95 as envisaged in the corporate plan Initially 4 facilities like the preparation of projects and pre-issue appraisal reports syndication of loans and the co-acceptance of bills of exchange was started Later underwriting of public issues was taken up and firm allotments of high quality scrips picked up Merger and amalgamation proposals were also undertaken Bill discounting and deferred payment guarantees were added

KSFC's application for Category I merchant banking status was accepted by the SEBI without any conditions Issue management activity has also commenced

Merchant banking activity generated an income of Rs 703 02 lakhs

TREASURY FUNCTIONS AND MARKET-LINKED RESOURCE-RAISING

During the year the Treasury department was carved out of the Finance and Accounts Department to monitor fund raising and manage resources and liquidity Another pioneering effort was KSFC's entry (the first for any PSU in Karnataka) into the area of unguaranteed bonds. A five year bond was structured for private placement at a highly competitive rate and Rs.60.00 crores successfully mobilised The medium and short maturity instruments were tailored to meet the requirements of short maturity outflows like bridge loans, corporate loans and NCDs and new business activities which are not covered by IDBI and SIDBI refinance.

FUTURE OUTLOOK AND PROSPECTS

After the extensive diversification successfully completed in 1994-95, the Corporation intends to further develop new activities as self-contained profit centres It hopes to assume its rightful role as the promoter of industrial development in the small scale sector by entering into relationships with national and international investors KSFC hopes to promote the improvement of services in areas where the small scale sector is experiencing a dire need like factoring and venture capital Continuous improvement in appraisal and monitoring techniques to ensure upgradation of portfolio quality will also be a principal concern of the Corporation

The number of branch offices is expected to increase from 30 to 34 during 1995-96 There is also a proposal to enhance delegation of powers to branch offices to improve the spread and quality of services The building for the corporate office has also been inaugurated and will be occupied in the course of the year facilitating a better operational environment Similarly the office buildings in Hubli Chitradurga and Raichur are expected to be ready by the end of the year

The plan for computerised networking of branch offices and bringing them on line is under implementation With that KSFC would be the first SFC in the country to have advanced towards networking

ACKNOWLEDGEMENTS

I wish to place on record my sincere thanks to the Governments of Karnataka, Departments of Finance and Industries and Commerce for their valuable co-operation and support I am thankful to the Industrial Development Bank of India (IDBI) and the Small Industries Development Bank of India (SIDBI) for their valuable guidance and needbased refinance

May I place on record the support and co-operation extended by the RBI, IRBI, KSIIDC, KSSIDC, DICs, KEB, KIADB, LIC, UTI, Apex Bank, Canara Bank, State Bank of India Capital Markets, State Bank of Mysore and other commercial banks. I also wish to thank voluntary organisations like CII, FKCCI, KASSIA, AWAKE and others for their contribution to our developmental activities.

Finally, I take this opportunity to express my deep appreciation of the untiring efforts put in by Dr Renuka Viswanathan, Managing Director and the officers and officials of the Corporation which has enabled the Corporation to continue to occupy the preeminent position among SFCs in the country.

Bangalore **B.K.Bhattacharya**

(Excerpts from the chairman's statement at the 36th Annual General Meeting)

Tenets of Tenth Finance Commission

A Critique

Amaresh Bagchi

The experience of the last four decades shows that the system of federal transfers in India while providing a mechanism for addressing the vertical and horizontal imbalances significantly, has run almost into a dead end primarily because of two factors (i) the approach of the Finance Commissions in tackling the tasks set for them and (ii) the dichotomy between plan and non-plan segments of the government budgets

Do the innovations and new formulations of the Tenth Finance Commission help to address better the basic tasks which every large federation has to face redressing the vertical and horizontal fiscal imbalances inherent in the distribution of powers and functions among the centre and the states and the disparate levels of income and development across regions?

I
Introduction

THE Tenth Finance Commission (TFC) has received quite deservedly, handsome compliments from reviewers for coming out with a crisp concise and highly readable report One would readily endorse that in the sequence of Finance Commission Reports the Tenth Commission is among the outstanding ones [Guhan 1995] It has broken new ground and made bold to recommend a basic change in determining the devolvable tax revenues of the centre by pooling the proceeds of all taxes instead of going tax by tax accepting a long standing advice from experts It has tried to rationalise the tax devolution formula by unifying the criteria for allocating both income tax and union excise duties and by dropping the one that seemed to foul up the progressivity' of the transfers However the pertinent question is do the innovations and new formulations help to address better the basic tasks which every large federation has to face and which provide the rationale for the creation of Finance Commissions under the Indian Constitution, viz, redressing the vertical and horizontal fiscal imbalances inherent in the distribution of powers and functions among the centre and the states and the disparate levels of income and development across regions?

II
Plugging Vertical Gap

The first task that the TFC like its predecessors had to address was how to determine how much of the revenue of the centre should be devolved to the states to meet their needs without upsetting the centre's budget The task acquired added urgency because of the fact that for over a decade, neither the centre nor the states (in general) were able to meet their expenditures out of their available revenues (Table 1) and were resorting to borrowing on a massive scale Reflecting concern over this situation the terms of reference of the TFC enjoined that in making its recommendations the commission shall have regard among other considerations to the objective of not only balancing the receipts and expenditures on revenue account of both the states and the central government but also generating surplus for capital investment and reducing fiscal deficit

This was an almost impossible task especially with the centre projecting a pre devolution deficit on revenue account for the reference period of the commission and not a single state showing a pre devolution surplus on its revenue account Nevertheless the TFC went about the task heroically by first trying to trace the origins of the problem and its root causes The conclusions reached though on familiar lines, throw some new light on how the deficits have surfaced on the revenue account at both levels of government

At the centre (as also in the states) the trouble arose with the practice of borrowing to meet revenue account deficit Although policy-makers are all seized of the urgency to reverse the trend, there does not seem to be any easy way out It is evident that with the unit cost of borrowing going up – the monetised deficits being eased out – the burden of interest payments will keep mounting and budgets cannot be balanced unless expenditures are reduced or taxes register better growth In the case of the states until 1986-87 the non-plan revenue account used to turn out surpluses larger than the requirement of the revenue component of the plan Between 1986-87 and 1991-92 the plan revenue deficits exceeded the surpluses from the non-plan account Since 1991-92 non plan revenue account also has been in the red The commission had obviously reasons to conclude that the fac that all states have had almost identica turning points seems to suggest that ther are systemic factors underlying thi deterioration rather than state specific reasons What these factors could be are not gone into in any depth except for the tendency on the part of the states to budge for larger plan outlays than warranted by resources The consequences, however are well known – neglect of maintenance of assets and of investment in infra structure human and physical apart from piling up problems for the future While acknowledging that the fiscal crunch would affect different states differently and to some extent this can be addressed through a greater degree of progressivity' in the devolution to the states, the commission goes on to observe quite rightly that "the primary responsibility for strengthening the resource base is that of the states The states will have to make continuous efforts to improve their revenue base strengthen their capacity to provide better services and curtail expenditures

TABLE 1 REVENUE SURPLUS (+)/DEFICITS (–) OF CENTRE AND STATES AS PERCENTAGE OF GDP (1951 52 TO 1993 94)

Year	Center	States	Total
1960 65 (Average)	0 73	0 13	0 86
1965 70 (Average)	0 56	-0 08	0 48
1970 75 (Average)	0 32	-0 18	0 14
1975 80 (Average)	0 44	-0 13	0 31
1980 85 (Average)	0 38	-0 16	0 23
1985 86	-2 12	0 21	-1 91
1986 87	-2 65	0 01	-2 65

Source Indian Public Finance Statistics

Against this background the TFC set about to address the tasks set for it by making reassessment of the forecasts of revenue and expenditures of the centre and the states for the years 1995 2000 in order to generate sustainable non plan revenue surpluses with the caveat that the final outcome on revenue account of the budgets would depend on what happens on the plan revenue side an imponderable factor so far as the FC was concerned (It may be recalled that unlike in the case of the Ninth Finance Commission the TFC was not called upon to go into the plan revenue account)

The final picture that emerged from the exercises could not have been more reassuring Non plan revenue account of the centre after the transfers awarded by the TFC for the five year period 1995 2000, shows a surplus of Rs 41 231 crore the deficits disappearing after 1995 96 and rising to Rs 20 942 crore in the final year 1999 2000 In the case of the states no state would be left with any deficit on the non plan account after devolution What is more, all states would have surpluses though of varying magnitudes in the final year The TFC no doubt fulfilled the requirement of its terms of reference although with the caveat that what happens on the plan side was beyond its purview

It should not come as a surprise to anyone that the figures that have come out of the budgets for 1995-96 pay little heed to the FC s projections The centre s budget for the first year of the five year period shows a non plan revenue deficit of Rs 6 211 crore against Rs 1 768 crore assessed by the TFC the difference arising from the revenue side (*vide* Table 2) The picture does not seem to be very different for the states The budgets of two states for the current year for whom figures are readily available viz Tamil Nadu and Kerala anticipate non plan deficits (before devolution) of Rs 2 531 crore and Rs 1 789 crore comparing with Rs 1 503 crore and Rs 1 030 crore assessed by the TFC The position is unlikely to be any better in the other states and it would be surprising if the actuals do not diverge significantly from the estimates

Such divergences however cannot be held against the TFC After all this is not the first time that the FCs projections are belied by the actuals Actual non plan revenue gap for 1990 95 for all states taken together turned out to be Rs 1 24 376 crore against the Ninth Finance Commission s estimate of Rs 55 866 crore Similar divergences marked the actual deficits as compared with estimates made by the Seventh and the Eighth Commissions Routinely the FCs are taken to task by critics for failing to make their projections realistic The TFC too has come under severe criticism for ignoring some of the looming liabilities of the centre like the additional staff emoluments likely to arise from the Pay Commission s recommendations and taking too optimistic a view on growth of subsidies Projection of non tax revenues by assuming a much higher return from investment in public sector enterprises than they have been yielding has also been questioned [Guhan 1995]

These criticisms fail to appreciate the role of FCs in adjudicating the transfer of federal funds It is wrong and unfair to expect the FC to guess accurately what the governments will do with their budget in the years ahead although the parameters set by the FC should have a restraining influence The FCs are obliged to undertake an assessment of the revenue and expenditures of the governments at both levels in order to determine what should be their relative share in the revenues on a fair basis keeping in view their respective roles as envisaged in the Constitution and what they can raise by diligently exercising the powers vested in them It bears reiteration that such determination is called for because of the asymmetry in the functions and finances of the subnational governments in the country inherent in the constitutional provisions

For reasons of externalities (avoiding inter jurisdictional spillovers and conflicts) administrative ease and in the interests of macro management of the economy and smooth functioning of the common market most tax bases with significant revenue potential are vested exclusively in the national government In principle some of these tax powers could be assigned (at least concurrently) to the states Where this is not the case it is only proper that the revenues raised by the centre are shared with the states Of course in determining how much should be shared due note must be taken of the requirements of the centre too But the needs and revenue capacity of both levels of the government have to be assessed normatively

After all the key question is keeping in view the constraints how much can the centre raise if it exercised the powers available with it judiciously? The states share ought to be decided on that basis and not what the centre chooses to do Suppose the centre decides not to exploit some of its tax powers fully for reasons of expediency or rely on instruments which beget resources that do not have to be shared (like the surcharge on income tax and raising the prices of PSE products) or through seigniorage, or makes commitments for expenditures not strictly required for discharging its constitutional responsibilities Should the states suffer for the centre s defaults? The answer clearly is no But what is judicious or fair leaves open a wide ground for subjective judgment and hence the need to look at the realities But there is no reason why the realities should be taken as *fait accompli* or why the

Note This excludes st[illegible] mount given to the states outside the framework of TFC recommendation

FC should be asked to take the situation prevailing in the base year of its reference period as given. One may therefore ask, has the TFC assessed the revenue and expenditure requirements of the centre and the states for purposes of sharing of central revenues fairly and not so much whether its projections are 'realistic'.

The question, alas, does not admit of a simple answer. For, as just mentioned, what is fair inevitably involves an element of subjective judgment. Is there any way in which the revenue potential and resource requirements of governments already burdened with commitments made in the past be assessed objectively?

Some objective norms could possibly be set up in the case of the states since there are so many of them, and so, despite diversities, yardsticks can be found to estimate what they could raise legitimately be expected to raise and spend by looking either at averages, or, as they do in Australia, by taking a few of the relatively good performing ones to set standards for others to follow. Disparities in revenue bases can be taken care of by suitable grouping of the states (high income, middle income and so on). While broad judgments would still be needed, the 'average' or the 'representative approach' does show the way to set up norms with a measure of objectivity.

Such an approach, however, is inapplicable in the case of the centre for the simple reason that there are no rival or comparable governmental units whose performance could be looked at for guidance as a standard (unless one goes by the experience of other similarly placed countries). It would therefore appear that in estimating the centre's budget gap there is no alternative but to go by past experience and that is what the TFC has by and large done, viz, projecting the revenues by relying on observed buoyancies and applying them to anticipated increase in income and in doing so the commission has tried to be realistic in that it has assumed a reasonable rate of inflation and real income growth. Expenditures also have been projected on a reasonable assumption of what the centre would at a minimum have to bear. It can be argued that the TFC was well advised to ignore the liability likely to arise to the centre from additional establishment expenses if the Pay Commission recommends generous upward revision of salaries especially when it had ignored the recommendations of the Austerity Committee of the National Development Council. There was also nothing wrong in assuming a higher rate of return from PSEs than is turned out by them at present. The states cannot be expected to suffer if the centre does not set its finances in order. In fact, the TFC would be justified to assume a higher growth in revenues, keeping in view the extent of evasion in income tax and the untapped potential of taxation of services and also how much the centre could have saved in expenditures had it shed some of its acquired and not obligatory responsibilities like the Centrally Sponsored Schemes.

Similar standards could be applied to the states as well. In estimating their revenue potential one can legitimately inquire what could be raised by levying a mild tax on farmers or by widening the base of sales tax (e g, by curtailing the concessions). It would also be quite legitimate on the part of the FC to take the common expenditure functions or the practices of the best performing states to establish norms for others. The TFC can be faulted not for being unrealistic but for almost disavowing faith in the normative approach. Of course, the fact that the revenue requirements of both levels of governments

were 'reassessed' does show that it had followed some norms though not consistently (inasmuch as it took the base year figures as almost given) The commission would not have been vulnerable to criticism had it explicitly acknowledged the relevance of norms in effecting federal transfers and tried to improve on what the NFC had attempted instead of forsaking that path without convincing reasons or offering an alternative conceptual framework for equitable sharing of revenues between the centre and the states

The recommendation for pooling all tax revenues of the centre for sharing instead of having only income tax and union excises in the sharable pool does not make up for this conceptual weakness In suggesting that 29 per cent of the centre's tax revenue should be shared the TFC has gone by what has happened in the past and that too the recent past As may be seen from Table 3 till the end of the 1970s only about 32 per cent of the centre's gross revenue used to devolve on the states The states' share jumped up only from 1979 80 Apparently the TFC did not think it necessary to examine whether the centre's finances would be able to bear sharing of this order especially when it was known that the deficits in the revenue budgets of the centre soon became large and chronic only after the Seventh Commission's award raising the proportion of union excises for sharing from 20 to 40 per cent There could be no objection to fixing the level of sharing at any fraction of the centre's revenues if on an objective examination it was found that it would not impair the centre's capacity to discharge its constitutional responsibilities

The recommendation for merging additional excise duty on the three commodities i e, textiles tobacco and sugar also lacks conceptual sanction After all the centre was authorised to levy these duties in lieu of sales tax under a tax rental arrangement with the states and the power to impose sales tax on these commodities belongs squarely to them so long as sales taxation remains with the states Instead of looking at the interjurisdictional conflicts and damage to the economy which the system of sales taxation without harmonisation is causing the TFC has gone on to make this recommendation almost as a matter of expediency It would have been an altogether different matter if the TFC after due deliberation had taken the view that taxation of sales in a federation should for reasons of efficiency in resource allocation be assigned to the national government (unless the states agreed to harmonise their taxes through a destination-based VAT) But in that case the vertical imbalance would be accentuated and would call for corrective action If however the present scheme of assignment is to stay taking away the powers to levy sales tax on those commodities for good does not stand to reason

Even if one goes strictly by rational principles vertical imbalances are not easy to neutralise For after the revenues and requirements of the different governments are assessed normatively surpluses of the centre may not match the needs of the states Hence ideally given the constitutional provisions regarding assignment of powers and functions the proper course for a FC would be to assess first the revenue gap of the states normatively in the manner indicated above viz by looking at the tax bases available with them and estimating what could be raised by making average effort in the case of individual taxes levied by most states (or with moderate effort when a given tax source is not exploited significantly by any state) or apply an overall taxable capacity by one of the more acceptable econometric methods and determining the expenditure needs again by applying an average or a national and see how much they would require to discharge their basic functions The next step would be to look at the centre's budget again normatively, and see what it can transfer consistently with its requirements If the two do not match then the estimates on the states requirements have to be revised and the revenue to be shared determined through a process of iteration This is what the late D T Lakdawala had suggested in one of his numerous illuminating contributions on the subject [Lakdawala 1993] But what happens if neither the centre nor the states adhere to the norms?

For instance, if the centre pre-empts a larger share of the resources by raising them through non-sharable channels referred to earlier or through deficit financing or by undertaking populist expenditure programmes on political expediency and the states follow suit?

Thanks to the new economic policy, the scope for the centre to pre-empt resources

through non-sharable devices is now vanishing or getting restricted. The centre may yet expand its expenditures without adequate matching effort on the revenue side giving rise to tensions on the resource sharing with the states. So long as revenues flow to the states on the lines assessed by the FC, there should be no cause for worry. For, in that case, the consequence of what the centre does to meet expenditures beyond what is projected by the FC should be a matter for parliament to examine and not the states, though to the extent the centre's budget strategy causes inflation and thus has an impact on the availability of real resources of the states, they could be entitled to further devolution as compensation. In the final analysis, the centre's accountability has to operate through parliament.

Enforcing the accountability of the states is a different matter. Once the entitlement of each state is determined normatively (by assessing its revenue and expenditure on the basis of some norm), the states should be left free to do what they like with the amounts that flow to them from the centre. It is for the people of each state through their elected bodies to make sure that the transfers are used for the purposes they are meant for, viz, to bring the level of basic services to an all-India or standard level. Unfortunately, given the social and political realities of our country, enforcement of accountability is not simple.

A fundamental reason is the absence of a hard budget constraint. No doubt, denial of access to borrowing (except theoretically) and strict limits of accommodation from Reserve Bank should compel the states to follow the path of fiscal rectitude. Undeniably, the states are in a much tighter corner than the centre insofar as resources are concerned. Nevertheless, the phenomenon of revenue deficits run by many states year after year and the tendency to undertake expenditure programme which prima facie they cannot sustain (and this is true of the centre too) do not inspire confidence in the efficacy of the system in bridging the vertical gap to anyone's satisfaction. The states do have a hard budget constraint but it does not seem to be working in the right way all the time. There is a universal tendency to cut capital expenditures, since current expenditures are hard to cut. Maintenance gets neglected; schools and colleges run without essential physical support (blackboards, books and laboratory ingredients), hospitals go without medicines and government employees remain unpaid. Some states have been trying to overcome their budget constraint by borrowing from private sources through corporations owned by them or keeping the bills for suppliers unpaid for months. The system of federal finance in India has not succeeded in preventing the deterioration of the state finances that has taken place in many states.

The TFC has blamed the bifurcation of budgets into plan and non-plan for much of the ills and has recommended setting up a mechanism (a committee) for monitoring maintenance expenditure. The fact of the matter is that the transfer system in the Indian federal finance has no effective mechanism to enforce accountability at any level. While for the centre, accountability has to be exercised by parliament, in the case of the states, accountability is almost absent since the bulk of the transfers are essentially unconditional. The TFC has introduced tax effort as one of the criteria for tax devolution with 10 per cent weight. The formula for allocation of Plan funds also attaches some weight to fiscal management. Whether these have any impact on the fiscal performance of the states is a moot point.

One way of making the states accountable for their expenditure decisions is to orient the transfers to meet only the very basic requirements of the state governments, after allowing for their fiscal disabilities, and require them to fund expenditures over and above their basic obligations by raising revenue from their own sources – in other words, introducing accountability at the margin.

Another way could be to rely more on specific purpose grants. In determining the quantum of grants-in-aid the FCs in India have no doubt sought to provide specific purpose grants for upgradation of certain services like computerisation of treasuries, primary schools, girls' education and so on and for special problems. But these grants constitute a tiny fraction of the total grants. In the TFC's dispensation, grants for upgradation and special problems account for only 12.8 per cent of the total grants-in-aid which again forms about 9 per cent of the total transfers recommended for the reference period.

Ever since the Eighth Commission, Empowered Committees at the central and state levels have been entrusted with the monitoring of the upgradation grants and the TFC has recommended the continuation of these committees urging the state level committees to be more vigilant. But, the bulk of the statutory transfers made up of tax devolution and non-plan deficit fillers are, in essence, general purpose equalisation grants. Conditionality violates the spirit of equalisation grants and, when normatively assessed, these grants are based on the presumption that they would help the deficit states to bridge their budget gaps after providing basic services at an average level if they make average efforts on the revenue front. There is no way the equalisation grants can be subjected to conditions that oblige the recipient governments to put in average effort

to raise revenue or provide the services which the grants-in-aid are supposed to facilitate

As argued above, ultimately, it is for the people of the states concerned to make their governments accountable for the proper utilisation of the funds devolving from the centre However it is not unusual for the central governments in federal countries to set national standards in respect of certain basic public services like health, education, basic civic facilities like drinking water supply and the federal transfers to be designed to achieve these standards In Australia, the specific purpose grants constitute the bulk of the federal transfers even though the vertical gap is quite large there In the Interim Constitution of South Africa the central government is empowered to set national standards of basic public services

Conditional general purpose transfers may not be acceptable in India, since they would be viewed as violation of the states autonomy This perhaps explains the reliance of the centre on centrally-sponsored schemes to promote national objectives These and the plan grants which are supposed to help the states in financing their plans could be used to enforce adherence to the norms or assumptions underlying the FCs transfers Thus, plan grants could legitimately be made conditional on making average tax effort (e g, by levying taxes on the farm sector) instead of encroaching on (and thus free riding) each other s tax space (through inter state sales tax and octroi on universal inputs like petroleum products)

It would thus appear that the TFC s tenets for tax sharing and grants in aid do not reflect any awareness of the fundamental weaknesses of the inter-governmental fiscal relations in India On the contrary they go against some of the basic principles of federal tax sharing and grants e g whey they recommend that no weight should be attached to contribution while allocating the proceeds of income tax The argument advanced in support that the country as a whole represents a common economic space and market and incomes do not originate locally etc are fallacious and miss the essential purpose of taxation viz to get the beneficiaries of public services provided by a government to pay for the generalised benefits according to ability to pay and since income is a good index of such ability residence based personal income tax and to some extent business income tax should be taxable by the governments of jurisdiction where they are located The same logic applies for taxation of consumption It is the convenience and economy in administration and the facility of harmonisation that primarily argues for central levy of these taxes An additional consideration is to enable the centre to have access to adequate resources to effect equalisation among the states But the primary rationale for a given tax assignment scheme should not be lost sight of The main flaw of the TFC's vertical sharing proposal is the lack of a clear conceptual framework

III
Horizontal Equalisation

The same deficiency marks the scheme of allocation of taxes and grants among the states The objectives of redressing both vertical and horizontal imbalances would have been served better had the transfers ordained by the TFC been guided by a clearer view of what these are supposed to achieve in a federal system To repeat, where the sub national governments do not have access to adequate revenues to meet their expenditure liabilities there has to be a transfer mechanism whereby funds can accrue to the lower level governments to enable them to meet their budget gaps having regard to their fiscal capacities and responsibilities In a country with sharp disparities in income levels across regions it is taken as axiomatic that federal transfers ought to be progressive While this expectation is natural, the presumption that the transfers must be progressive is not logical

Admittedly by and large states with poor fiscal capacity should receive more than others but such progressivity should be incidental, resulting from their fiscal disadvantages and not an end in itself It is quite possible that a state with a relatively good fiscal capacity suffers from certain disability in terms of higher costs of providing services (such as difficult terrain, etc) which its better revenue capacity does not fully offset One can also visualise a situation that a state with relatively low per capita income has a larger taxable capacity than one with similar income level because of skewed distribution In such a situation, emphasis on progressivity that too merely with reference to average income levels would be misplaced Unfortunately FCs in India have tended to be persuaded by consideration of progressivity as such rather than in trying to see how the fiscal capacities can be equalised Hence, the attempt to introduce a host of criteria even in tax devolution and every FC tries to do one better than its predecessor by appearing to be more progressive

The TFC too has tried to introduce new criteria in its devolution formula in order to improve progressivity while trying to simplify the system by laying down uniform principles for devolving both income tax and union excises A comparison with the formula used by the NFC however raises doubt whether the results achieved have been worth the effort

Table 4 sets out the statewise total transfers recommended by the TFC broken up under 'tax devolution' and grants along with the amounts which would have worked out had the criteria adopted by the NFC been followed. The table also shows the difference It will be seen that the end result of the changes made in the formulae for allocation of shared taxes and grants-in-aid is a diminution in what the high and the low income states would be entitled to under the NFC's criteria and a fairly hefty increase in that of the middle income and special category states Barring Bihar, all the other four states in the low income category lose by significant amounts The gainers among the middle income states are Andhra Pradesh (Rs 1,903 crore) Karnataka (Rs 1,106 crore) and Kerala (Rs 277 crore)

It may well be argued that the change signifies an improvement because the NFC's dispensation was not fair to the middle category states The NFC's formulae suffered from a convexity in its progression and the change made by the TFC seeks to correct this deficiency One may however point out that the coefficient of variation (CV) in the TFC s total transfers is lower than what marked the transfers by the NFC's formulae indicating a weakening of the redistributive effect (Table 5) and this is largely due to the changes made in the distribution formula for grants Overall if one goes by CV, the TFC s dispensation is less progressive One may also ask if progressivity is to be aimed at as a goal in itself where does one stop? What is the optimum degree of progressivity? In order to impart greater progressivity in the transfers, the TFC has measured taxable capacity of the states by taking their tax SDP ratios (virtually disregarding other factors that have a bearing on tax potential) but taking the square of per capita SDPs as the denominator instead of simply SDP per capita One may wonder why stop with a power of 2 for the denominator?

Incidentally in judging the equity of the transfers, special category states are usually left out but the difference in the per capita devolution to these states under the TFC s awards as compared to that for the low income states in the general category is much too large to be passed over as of no

TABLE 9 COMPONENTS OF FEDERAL TRANSFERS UNDER FINANCE COMMISSIONS RECOMMENDATIONS

	Tax Devolution	Grants	Total Transfers
Fifth Finance	4562	859	5421

Commission	(91 00)	(9 0)	(100)

consequence. Per capita devolution to some of the special category states is as high as Rs 18,300 whereas for the low income general category states the average is a little over Rs 2,500. The unhealthy effect of such transfers on fiscal discipline does not seem to have received much attention from the TFC or the earlier commissions.

Leaving out the special category states, as argued earlier, the preoccupation with progressivity in the context of federal transfers is a little misplaced. Progressivity cannot be an end in itself in deciding the allocation of federal funds among the constituent units in a federation although given the disparities in fiscal capacities, states with relatively poor revenue base should be able to get more unless their disability in this regard is offset by cost advantages. It is also not possible to say how progressive a scheme of redistribution should be if fiscal discipline is also to figure as a relevant consideration. In fact, the two criteria are often conflicting.

On the face of it, the transfers recommended by the FCs are equalising. As may be seen from Table 6, as of 1991-92, high and middle income states having about 50 per cent of the country's population account for roughly 70 per cent of the own tax revenue of the states. But their share in the states' current expenditures works out to not more than 58 per cent of the total revenue expenditures. In the case of low income and special category states, the share in expenditure is much higher than in own tax revenue (42 per cent as against 28 per cent), clearly reflecting the beneficial effect of the transfer system. It goes to the credit of the TFC that in the revenue expenditures assessed by it for purpose of working out the fiscal gap of the states, the share of the high income states gets reduced further. However, the per capita revenue expenditures of governments in high income states is still higher than that of the low income group by about 70 per cent, though this disparity is much less sharp than in their own revenue or SDP (the ratio of maximum to minimum in per capita own revenue is in the region of five and in per capita SDP, it is a little over three).

A striking feature of the dispensation of the TFC is the disparity in per capita revenue surpluses after devolution. Table 7 shows the revenue surplus per capita for the states of the general category. The highest is Haryana's (Rs 3,649) while the lowest is that of Orissa (Rs 0.82). Such disparities in the per capita revenue surplus are not a new phenomenon. But the gap seems to be much wider under the TFC's award than ever before (Table 7).

It may legitimately be asked: should the FC's transfers be expected to equalise the revenue surpluses. Prima facie the answer would seem to be no. After all, the primary objective of the revenue transfers is to correct the fiscal deficiencies of the states so that the levels of essential public services do not differ too much across regions and not to neutralise the differences in endowments. The fact, however, remains that the capacity of a state to provide the basic services depends crucially on their infrastructure, physical and human, and if the levels of public services are to be equalised or made comparable, massive investments would be required to build up infrastructure in the backward states. That is what the development programmes under the Five Year Plans are supposed to facilitate. But the ability of the states to undertake developmental expenditures depends largely on the surpluses available on their revenue budget. The main reason why the per capita plan outlays of the states vary a lot (*vide* Table 8) is that there are acute disparities among the states in the surpluses generated on their revenue budget. Again, it may be argued that it is not the responsibility of the centre to bring about absolute equality in plan outlays. Nor can one expect such parity when the endowments are unequal. While this is true, much of the regional inequalities can be reduced and ought to be addressed by the central authorities (and that is crucial for the survival of any federal polity). The Indian federal system is yet to find a way of bringing down the inequalities across regions even in the matter of basic infrastructure like power and roads. The TFC has sought to introduce the index of infrastructure as a criterion for tax devolution with 5 per cent weightage (and also 'area' with another 5 per cent). These are obviously of little help in placing larger funds with the backward states to undertake the investment in infrastructure – they badly need unless their non-plan revenue budget generates sizeable surpluses.

Primarily one may argue it is the responsibility of the Planning Commission to see that the distribution of public investment serves to reduce the regional imbalances. That calls for concentrating resources in developing the infrastructure of the backward regions leaving the developed states to look after themselves. That does not seem to be possible to the extent desirable – and the need has acquired urgency with the liberalisation of the economy to allow freer play for market forces – as long as federal funds keep flowing to the states that do not need them so much. The paradox of states having large predevolution surpluses also getting sizeable federal funds through FCs transfer came in for criticism from scholars like Lakdawala in the past but with no apparent effect.

The problem is perhaps inherent in the present system of federal finance where some taxes have to be devolved compulsorily. Nevertheless it is open to the FCs to reduce the share of tax devolution and rely more on grants in the total transfers. Over the years, the proportion of grants in the total transfers has tended to decline. The NFC had tried to reverse the trend but TFC apparently did not think it necessary to go in that direction (Table 9). There is a limit to which the devolution formula can take care of the needs of the poorer states and that limit seems to have been reached.

The equalising edge of the transfers is blunted also by the practice of using 1971 population figures in the devolution formulae to determine the shares of different states. Apparently intended to punish the fast breeding states, this is a senseless way of enforcing demographic discipline. It is a pity that no one in the Finance Commission or the Planning Commission (with the honourable exception of C H Hanumantha Rao) thought it fit to raise their voice against this stupid mandate.

Another factor having a bearing on inter-jurisdictional equity in the sharing of tax revenues is the phenomenon of 'tax exporting' practised by the states in the form of central sales tax that is tax on inter-state sales (and also through octroi/entry taxes on major inputs like petroleum items, coal and iron ore). Recommended by the Taxation Enquiry Commission of 1953-54 as an instrument to regulate taxation of inter-state trade, the central sales tax has allowed the states to encroach on each other's tax territory. While all states derive sizeable revenue from this source, it is the relatively-advanced net exporters among the states who gain at the cost of others. No serious note appears to have been taken by the TFC or its predecessors of the consequences of this practice for the taxable capacity of the poorer states.

Questions about inter-state equity also arise when the central government undertakes to provide counter guarantee for foreign investments flowing into some of the states. Since private investors would prefer to go only to states which are already relatively better placed, such counter-guarantees (even if adjustable against other transfers) would tend to accentuate the regional disparities. The implication of this newly emerging phenomenon called for some attention from the TFC.

The fact of the matter is that overseeing inter-jurisdictional equity in revenue allocation in a multi-level system of government needs constant vigilance along a wide front. Short-lived FCs like in India are scarcely equipped to guard against inroads that can occur in the course of the actual operation of the fiscal system. Which is why among other reasons it seems preferable to have a permanent body with strong technical support to adjudicate the allocation of resources among different levels so that harmony in inter-governmental relations does not get derailed by default.

Concluding Comments

The experience of the last four decades shows that the system of federal transfers in India while providing a mechanism for

addressing the vertical and horizontal imbalances significantly has run almost into a dead end primarily because of two factors (i) the approach of the FCs in tackling the tasks set for them and (ii) the dichotomy between plan and non-plan segments of the government budgets For all the sophistication in the devolution formulae the transfers have resulted in providing the relatively better placed states with surpluses for development expenditures on a much larger scale than those who need the funds more It is therefore not surprising that regional inequalities not only in per capita incomes but even public services persist On the other hand revenue accounts of both centre and the states are suffering from acute chronic imbalance Correction of the situation calls for a restructuring of the powers and functions of the centre and the states towards lessening of centre's involvement in activities which belong more to the states Federal transfers should focus mainly on redressing the fiscal disability of the poorer states

It is also necessary to take a fresh look at the respective roles of the FC and the Planning Commission This has become all the more necessary with delicensing of industries and the likely accentuation of regional inequalities The TFC was right in pointing to the plan revenue expenditure as a major factor in the revenue deficits The country needs a debate on how the inter governmental fiscal relations should be restructured in the new environment The initiative taken by Guhan (1995) towards this end is thus to be welcomed One only hopes that many more will join in deliberating on what should be done

Note

[The author wishes to thank Sujata Dutta for statistical computations and R Parameswaran for secretarial help]

1 The personal income tax is a case in point If taxation is to proceed on the benefit principle, governments providing public services should be able to recover the costs from the beneficiaries and therefore, lower level governments should have the powers to levy a residence base non-progressive income tax [McLure 1993] This justifies the assignment of taxes on professions, trades and callings to the states The constitutional limit of Rs 2 500 however greatly reduces the potential of the tax

NATIONAL SEMINAR ON

"PROBLEMS AND CHALLENGES OF TECHNOLOGY TRANSFER, IN-HOUSE R&D AND INDIGENOUS TECHNOLOGY FOR INDIAN INDUSTRIES IN 1990'S"

TO BE HELD AT I.I.T., BOMBAY, UNDER THE AUSPICES OF THE DEPARTMENT OF HUMANITIES AND SOCIAL SCIENCES ON 8-10 JANUARY 1996

This is an inter-disciplinary seminar touching upon S&T policy, and the economic, legal and technical aspects of the theme under the changing conditions ushered in by liberalization of policies.

Participation and contribution of papers is solicited from social scientists, scientists and engineers/technocrats both from industry and academic, latest by 20th September, 1995.

Kerala: Towards a New Agenda

Thomas Isaac T M
Michael Tharakan P K

The experience of Kerala shows that the conditions of life of the people can be improved even at low levels of economic development through appropriate public action for social provisioning and redistribution The mass of Indian people do not have to necessarily wait for an indefinite future for the hump of economic growth to be crossed for schooling, house sites, primary health care, food at fair prices and so on

The contemporary crisis that Kerala faces, nevertheless, underlines the limitations of what can be achieved within the present system It also shows that in the absence of economic growth it is difficult to sustain, much less expand, welfare gains The challenge is to enlist the increased political consciousness and organised strength of the people as an instrument to accelerate economic growth in a democratic fashion Correctives to the various distortions in the social and cultural areas are also required

From the dialogue at last year's International Congress on Kerala Studies certain broad perspectives emerged, though some important questions were indeed left open and unconcluded

KERALA has been in national and international attention for successful performance in key areas of human development, particularly education, health and social welfare measures Kerala's experience shows that conditions of life of the people can be improved even at a low level of economic growth through different forms of public action What is not so well known, however, is the grave crisis that has characterised the state during the past two decades The spheres of employment and material production have been in the grip of stagnation All around there have emerged visible signs of decay, resurgence of casteism and communalism and a virtual political stalemate with the left failing to effect a decisive breakthrough, degeneration of popular culture and so on Even the much acclaimed progress in education and health looks vulnerable There is a growing feeling that a new agenda responsive to the changed reality needs to be drawn up, so that the new challenges can be met, the progressive heritage preserved and the cultural and material life of the people further improved

The response to the initiative of AKG Centre for Research and Studies, Thiruvananthapuram, to bring together scholars from different disciplines in the broad area of Kerala studies and concerned socio-political activists in an International Congress (August 27-29, 1994) was overwhelming Perhaps such an initiative had indeed been long overdue Around 1,600 persons (nearly 700 being academic scholars from more than two dozen disciplines) attended the Congress There were participants from 23 countries other than India and nearly all the major states in India Over 600 papers were presented and discussed in 66 technical seminars and six symposia Altogether 170 hours of discussions took place in 17 venues of the Congress

No attempt is made here to undertake a comprehensive survey of all the papers presented at the Congress Our effort is only a selective reading of presentations around certain major connected themes — Kerala's development experience, the contemporary crisis and new initiatives — that one can discern in the proceedings

Kerala's development experience has come to be summed up in a commonly used phrase, 'Kerala Model' A considerable number of papers presented at the Congress mentioned this term in a bewildering variety of notions, some in explicitly normative terms As a result, a growing discomfort with the concept was discernible [1] The broad ideological approaches with regard to the concept that were expressed in discussions are analysed in Section I followed by an analysis of the problems of contemporary economic stagnation and socio-political challenges in Section II

The Congress was not expected to come up with an action plan and clear-cut conclusions It was to be an open and democratic dialogue with the widest participation. Even the normal practice of an individual delivering the valedictory address at the conclusion of the conference was done away with and, instead, a panel of experts of divergent persuasions was asked to sum up what the Congress meant to them Therefore, our discussion emphasising the importance of production and productivity (Section IV), a new development strategy (Section V), reassessment of educational and health policies (Section VI), importance of decentralisation (Section VII), need for the left to enter into dialogue with believers without compromising with casteism and communalism (Sections VIII and IX) and the gender question (Section X) should not be taken as an exhaustive agenda for future or a consensus reached by the Congress. At best, they may be termed as the emerging perspectives, as read by the authors.

I
Kerala Model

Kerala's development experience questions a widely held paradigm. first agriculture and industry have to develop and then, in due course, improvement in the standard of living of the masses would take place. It is this historical sequencing of economic growth and mass welfare sanctified by the experience of developed countries that is being challenged by Kerala One of the relatively economically backward states in India with per capita domestic production consistently below the national average, Kerala has been able to provide for the basic needs of most of its citizens This is revealed by comparative indicators of health, education and demographic transition [2] A composite index of quality of life taking into account various factors placed Kerala far above the general situation prevailing not only in India but also in most parts of the third world.[3]

These average indicators hide the experience of communities that have been left out of the development process such as the fisherfolk and the tribals A number of papers sought to discuss such 'outliers' rather than 'the central tendency' There were separate sessions devoted to the status and problems of tribals and those of the fisherfolk and also a session 'profiling poverty' among stone breakers, coir workers, Tamil migrants, etc. It was argued that the Kerala miracle had bypassed agricultural labourers too The days of employment for agricultural labourers had continued to shrink, adversely affecting their earnings [4] However, there were other papers which indicated that even though the relative backwardness of dalits persisted, their situation was relatively superior to that in the rest of India,[5] there was significant occupational mobility in terms of job diversification and aspirations[6] and the gap in terms of development indicators was rapidly narrowing within Kerala.[7]

The factors which hindered public action for 'capacity building' among the fisherfolk community were discussed in an interesting paper.[8] Caught in a peculiar matrix of socio-political factors there was no active demand from below from the community Thus the exceptions to the general societal tendencies in Kerala only underlines the active role of

the people in demanding the supply of development services and monitoring their effective implementation

It is precisely this active role of the masses in demanding redistributive policies or directly pursuing such goals themselves that is being ignored by two opposing ideological approaches to the Kerala model those who hail it as the ideal 'cheap' model and those who reject it as yet another distorted outcome of neo colonial development

It has been argued by the first school that Kerala has succeeded in achieving a quality of life nearly comparable to the developed countries at a much lower level of resource consumption [1] ce Kerala has been hailed as the 'the best sustainability model' No other large population on earth adequately meets the requirements small families combined with modest consumption' Another variant of this approach hails Kerala as a short-cut to development where quality of life can be improved without economic growth or social change Thus Kerala becomes an ideal 'cheap' model of development [1]

No wonder in his opening address I M S Namboodiripad made a request not to let "the praise that scholars shower on Kerala for its achievements divert attention from the intense economic crisis that we face We are behind other states of India in respect of economic growth and a solution to this crisis brooks no delay We can ignore our backwardness in respect of employment and production only at our own peril" [1]

Partly, as a reaction to the idealising of the present state of affairs there has risen a tendency to denigrate the achievements of Kerala in the social sectors Alternative indices of development, taking into consideration per capita income unemployment and other indicators of economic backwardness show Kerala slipping sharply down in the rank order of development [1] This portrays Kerala as a growthless model But the paradox of Kerala's experience lies precisely in achieving a relatively high quality of life at a low level of economic development Low economic development is normally associated with low quality of life A key question is if the people of Kerala are worse off because they had better education and health An affirmative answer to the above question implicitly accepts that there is an inherent trade-off between growth and equity

The logical extreme of the above argument is the condemnation of Kerala's educational and health development as yet another variant of the underdevelopment paradigm under colonial and neo colonial conditions [14] The commercialisation of agriculture and development of the modern Kerala economy took place under colonial conditions in response to largely external impulses [15] The development of the educational and health sectors, transport network, etc, were but yet another element of the above process The result has been that Kerala today is not only an exporter of raw materials but also of educated manpower The brief period of the World Bank's flirtation with the Kerala Model is often depicted as the final confirmation of the apparently imperialist design Discussion at this juncture assumes a conspiratorial overtone [15]

The colonial integration and consequent underdevelopment was a worldwide phenomenon but not many regions in the underdeveloped world experienced progress in social sectors as in Kerala Only a viewpoint that takes people as passive victims of imperialism can miss the struggle of the people for improving their social conditions and the underlying politics of improvement in social indicators It is in this context that the history of peoples' struggles and conscious generation of demand from below as the prime mover of social sector development becomes relevant

II
Making of the Model

It is likely that Kerala's literacy tradition predates modern political development [16] Available evidence from last century indicates relatively high rates of literacy for the different constituents of present-day Kerala It must be admitted that our knowledge of pre-colonial Kerala is extremely scanty The specific features of the pre-colonial agrarian society active trade links with foreign countries and Buddhist traditions in the state are some of the factors that have to be taken into consideration [1] There is a growing consensus today that the developments in the 18th century constitute an important turning point [1] The century witnessed a process of political centralisation under powerful monarchies The emergence of centralised monarchy was disrupted in Malabar In the south in the context of restricting the power of local barons, the monarchies built up an alliance with the middle level of agrarian and social hierarchy consisting mainly of tenant cultivators artisans traders etc [1] As a result we find the monarchy in Thiruvithamcore both as an independent power and under the British paramountcy inclined to various measures such as proprietary rights to the tenants in government lands opening waste-lands for cultivation and so on which were beneficial to the above strata These steps accelerated the process of commercialisation of agriculture The expansion of commerce and modernisation of administration increased the demand for educated personnel The government initiatives in mid-19th century like instituting grants-in aid to non-governmental institutions have to be seen in this context.

The process of commercialisation and modernisation gave rise to a new middle social strata of commercial farmers, traders, petty industrialists and professionals These strata were emerging from middle castes and communities like Syrian Christians and Ezhavas who were better placed to make use of the emerging opportunities in terms of their inheritance system, occupational diversity and links with the growth pole sectors The economic advances that these caste and communities could make did not coincide with their social status This was the context of the emergence of socio-religious movements to reform the various caste and community customs and rituals and in the case of the 'avarna' castes and communities to fight against upper caste domination [20]

Various reform-oriented interpretations of texts, rituals and customs arose Most significant among them was that of Sree Narayana Guru who enjoined upon his followers to "strengthen through organisation and liberate through education" [21] The upper castes, particularly the Nairs, were also forced into the reform stream due to the threat from the Syrian Christians and Ezhavas from below and the non Malayalee Brahmins from above who monopolised the upper echelons of the bureaucracy Education was the watchword of these movements as a ladder for upward social mobility for the lower castes and for self-preservation for the upper castes in the fast changing world Moreover and most importantly the community based organisations themselves competed with each other to found institutions with or without government aid to cater to the demand generated by the socio religious movements Temple entry was preceded for decades by the demand for the right to enter schools from castes lowest in the prevailing hierarchy The historic call of Ayyankali [3] the Pulaya leader of Thiruvithamkoor to agricultural labourers for an indefinite boycott of agricultural operations was for the right for education The models of new schools and hospitals were the contribution of missionaries for whom the services in sectors like education and health were part and parcel of their proselytising efforts They were forced by the dictates of their involvement to cater mainly to the marginalised sections [24]

The role played by the demand from below in the spread of educational facilities is most dramatically exhibited if one compares the widening literacy rate differential between Malabar and Thiruvithamkoor throughout the colonial period [25] The changes brought about in agrarian relations in southern Kerala facilitated faster commercialisation of agriculture and the emergence of relatively stronger new middle classes in southern Kerala when compared to the north The

[illegible] also relatively stronger in southern Kerala. While under colonial impact the indigenous educational system largely crumbled in Malabar, it got a new lease of life in the south

However, by 1930s and 40s the first stage of the Kerala renaissance[36] led by the great socio-religious reform movements had run out of steam and the energy for continuation of the renaissance traditions came from a new source the socialist and communist tendencies that had crystallised within the national movement in Malabar The class and mass organisations built up by the left attempted to organise people on the basis of their economic demands centred around wages and land In Malabar they transformed the tenancy reform movement dominated by the upper peasantry into a movement for comprehensive agrarian reforms This slogan had favourable reverberations in southern Kerala too At the same time they carried forward the demands for basic social services and justice Newspapers and journals were central to their campaigns the local village library was the centre of nationalist organisation and the schoolteacher was the political mentor of the local community [38] The anti caste campaign was an important element of the left nationalist agenda and an important element of the mobilisation strategy as in the case of agricultural labourers in Kuttanad [39] By the eve of independence the left had risen to the leadership of the national movement in Malabar The Punnapra Vayalar armed uprising helped the left to rise to a hegemonic position in southern Kerala also These set the background for rapid advance of left political forces in the 1950s and the 1960s The left governments in Kerala became important nodal points in the process of expansion of the social sectors and welfare measures [31]

An important achievement that needs to be specially mentioned was the setting up of a comprehensive public distribution system a direct outcome of the food struggles of the mid-60s Rationing had been introduced during the food famine of the war period Right from its inception rationing in Kerala was characterised by a high level of popular intervention and monitoring Various social security measures also came to be initiated during the post independence period

An important structural reform that generated demands for social services has been the implementation of the land reforms Land reforms were the culmination of a long history of peasant mobilisation from the 1930s Land reforms in Kerala have had many limitations, most important being the failure to implement the land ceiling clause and the exemption that was given to plantations [32] Yet land reforms brought about a fundamental change in rural society, particularly in southern Kerala, which [illegible] proprietary rights, the removal of a major parasitic claimant to the surplus, and agricultural labourers receiving ownership and security of residence in hutment land [33] It is significant that the gap between northern and southern Kerala in terms of social sector development began to narrow during the post-independence period The catching up process of the north has been remarkably rapid since the implementation of land reforms

It is possible to document the social intermediation [4] involved in the generation of demand for and supply of health services as in the case of education The socio religious movements laid special emphasis upon personal and social hygiene Literacy, particularly women's literacy was the key variable in the improvement of the health status of the people It is not possible yet to pinpoint the precise factors responsible for the remarkable expansion of female literacy in Kerala Most significantly there never has been a case of any organised opposition to female education The strong traditions of matriliny may have also contributed to the progressive attitude to women's education

The story will not be complete without mentioning the effect of the settlement pattern for which a separate session was devoted in the Congress The settlement pattern being dispersed and linear with high density of population resulting in congregation of large villages and small towns had helped the delivery of institutionalised and non institutionalised public services The number of beneficiaries and their accessibility increases as transport and communication facilities increase The rural urban continuum of Kerala's spatial ordering has facilitated more uniform dispersal of social infrastructural facilities [5]

III
Economic Stagnation

In the latter half of the 1970s as the achievements of Kerala in quality of life began to receive international admiration, the model itself was slipping into a major crisis [37] It was all pervasive but its most important constituent was the severe stagnation in the spheres of material production, soaring unemployment acute fiscal crisis and erosion of sustainability of the social welfare expenditures Therefore the focus of discussion at the Congress was more on the contemporary crisis and the possible solutions rather than on the much acclaimed achievements of the past

Kerala is one of the states that did not share in the acceleration of the national economy from the late 1970s Not only was the growth rate of SDP markedly lower than the national average but it was also significantly lower than the SDP growth rate achieved during the previous decade.[39] The greatest reversal was in the agrarian sector where expectations had been raised by the successful implementation of land reforms. However, the production of almost all major crops with the exception of rubber suffered an absolute decline between 1975-76 and 1986-87 Coconut output declined despite expansion in area On the other hand, the marginal increase in productivity of paddy was not sufficient to compensate for the sharp decline in the area under paddy due to shift in the cropping pattern With only 25 per cent of the area under paddy the dependence of the region on foodgrains from outside increased sharply

It is now evident that the severity of agricultural stagnation has been exaggerated by the gestation lags involved in the production cycle of perennial crops like coconut and rubber in favour of which an accelerated shift in cropping pattern has been taking place since the mid-70s [39] There has been a remarkable recovery in agricultural growth since the late 1980s largely due to the newly planted areas becoming productive But two caveats may be entered (1) Productivity of individual crops in Kerala is significantly lower than that in competing regions or countries (2) The new agricultural policies that are being implemented as a part of the structural adjustment programme threaten to rein in the upward swing of the agricultural production cycle While the increase in fertiliser prices has tended to push up the cost of cultivation in the predominantly potassium/phosphate fertiliser region the liberalisation of imports threatens rubber and coconut prices [40]

Similarly, industrial performance from the mid 70s has also been dismal Performance did improve for a brief period in the latter half of the 1980s But since the advent of the new economic policies, the industrial sector has slipped back into a severe recession with output declining at –1 14 per cent per annum As a result the share of the manufacturing sector in the state domestic product has tended to decline [41]

The traditional industries of Kerala like coir cashew and handloom have been in the throes of a crisis due to scarcity and escalation of prices of raw materials and increased competition in the product markets either from cheaper production outside Kerala or substitute products Employment and output in these industries have been declining [42] Performance of the small-scale sector has been poor when compared to the rest of India, with a higher level of sickness, smaller size of units, lack of diversification and slow growth [43] Investment in modern large-scale sector has been far from satisfactory with Kerala's share in central public sector investment declining to an all time low of 1 3 per cent in 1992 93 and the larger business

houses shying away from investment in the state

Stagnation of the agricultural and industrial sectors has aggravated the unemployment situation in the state The open unemployment rate is around three times the national average [44] Despite the high unemployment level the state also experiences acute labour scarcity in many traditional occupations as job expectations tend to rise with education and the educated tend to withdraw from low status jobs [45] At the same time, due to the prolonged waiting period involved in getting a formal sector job many educated unemployed seek employment in the new informal sectors which offer no security or fair wage but are nearer to their perceived reserve job status Thus despite widespread uni sation — a well known feature of Kerala — new informal sectors keep appearing Pursuit of higher qualification has been another adjustment mechanism during the waiting period for formal sector employment as the higher degree tends to raise the probabilit of getting some employm a even if it is non commensurate with the qualification Thus another paradox demand for degrees continues to rise despite high unemployment among the educated

The economic crisis has been camouflaged by the inflow of remittances from the Gulf region Fortunately for Kerala the migration to the Gulf began to pick up from mid-70s — precisely the period when the downward trend in the regional economy became visible [46] At the peak the remittance inflows constituted as much as a quarter of the state domestic product With the inclusion of the remittances, per capita income in Kerala would be higher than the national average [47] As a result, the phase of economic stagnation witnessed a remarkable improvement in the consumption standard in the state There was also remarkable improvement in the asset position of rural households during the same period Construction activities also boomed The demand for consumption and construction goods was largely met through inter-state import As a result the trade deficit of the state ballooned and in 1980 81 was estimated to be as high as 24 per cent of the SDP [48] Apart from the import leakage direct outflow of financial savings through banking and other channels tended to depress the linkage effect of remittances within the state While there has been a sharp increase in bank deposits, the credit deposit ratio has steadily declined to 43 per cent in 1994 [49] There was effective demand the financial resources were no constraint but the productive sectors remained stagnant

The picture would be incomplete without a reference to the acute fiscal crisis of the state government [50] The revenue account deficit has been rising from 5 per cent in 1985-86 to 16 5 per cent in 1994 95 The main reason for the revenue deficit is the refusal of successive finance commissions to take cognisance of the higher burden of recurring expenditure on the state due to its past investment pattern emphasising the social sectors The failure to generate sufficient budgetary surplus has been reflected in the low per capita plan outlay of the state The fiscal crisis of the state was aggravated under the new policy regime of the central government Given the popular resistance, the state government is forced to bear the burden of subsidy reduction in sectors like public distribution As a result, the ability of the state to sustain its much acclaimed social expenditures has already been severe ly compromised Kerala has earned the dubious distinction of being the only state in India whose real social expenditure has decreased during 1985-86/1991 92 period compared to the decade 1974-75/1984-85 [51] The public distribution system is also being undermined, threatening food security of the state [52]

IV
Reorientation of Mass Movements

The economic stagnation paved the way for an ideological backlash against the Left The dominance of the Left in the state was alleged to be the stumbling block for economic progress Trade unions and strikes for higher wages were blamed for the economic retardation, land reforms for agricultural stagnation, education for high unemployment and social welfare expenditure for the fiscal crisis Equity in Kerala it was argued was achieved at the cost of future economic progress The rigidities in the labour market and the political climate in the state discouraged investment Dismantling of the welfare structures removal of labour market rigidities caused by legislation and trade unions, removal of restrictions on changes in the cropping pattern elimination of land ceilings, privatisation of social sector services and reduction in social welfare expenditures constitute the main elements of the emerging rightist perspective Even some erstwhile liberals seem to argue that the Left in Kerala, whatever its achievements in the past in the shpere of distribution has to make way for new social forces that would launch the state on a trajectory of accelerated economic growth

The very same economic stagnation that has been fuelling the backlash has also been undermining the unity and the progress of the people's movements Thus for example, scarcity of employment opportunities converted reservations for dalits and backward castes, a tradition dating back to pre-independence days, into a hotly contested issue and a cause for casteist mobilisation Similarly, the stagnation of productivity is a major factor in the accentuation of the conflict between petty producers and wage labourers in the state

An important feature of production relations in Kerala is the relatively high prevalence of petty production. Eighty per cent of the landholders have less than half a hectare, the average size being less than 30 cents [53] Within the manufacturing sector, household units have tended to decline in the recent decades But rather than the factory sector it is the share of the non-household and non-factory small units which has been increasing [54] An important feature of these petty production units is the high incidence of wage labour In agriculture, even marginal landholders employ wage labour This is because small landholders, who cannot expect to make a living from their land often tend to seek wage or self-employment in the non-agricultural sector [55] Non-agricultural employment accounts for around 45 per cent of the workforce in the rural areas

Given the peculiar production relations, the growth of militant unions of agricultural labourers and labourers in small-scale industrial units tended to alienate from the Left the large body of petty owners, many of whom may well be employees in the non-agricultural sector Suspicions of such a process surfaced within Leftist circles while reviewing the 1978 electoral debacle when the LDF lost heavily in its traditional strongholds of Palakkad and Alappuzha [56] These two districts had witnessed the militant upsurge of agricultural labourers from the middle 60s It was evident that a large number of farmers who had gained land under the land reforms had shifted allegiance Attempts to restrict excessive' demands directed against small farmers created resentment among the agricultural labourers

Demand for remunerative prices became the main slogan for uniting agricultural labourers and farmers But with the prices of Kerala s crops being set in the national and international markets effective intervention in price formation had severe lim itations It is in this context that the question of productivity becomes relevant [57] From the point of view of the in ome of the petty producer how much is produced is as important as the price received It is only through sustained increase in productivity that the demands for higher wages can be realised in the long run Increase in real wages at a faster rate than increase in productivity, as is the situation in Kerala's agriculture and traditional industries, would result in a reduction in employment [58] The farmers have shifted to less labour-intensive crops or left their lands fallow The response in traditional industries to the wage increase has been varied—decentralisation of production into smaller units where trade unions are ineffective, adoption of labour displac

ing technologies or migration to neighbouring states where wages are low.[59]

The sessions on agrarian and trade union movements reflected a keen awareness of the above situation In fact the two sets of issues that figure prominently in the papers dealing with contemporary agrarian and trade union movements were (a) the implications of the new economic policies and the paramount need to mobilise the widest sections for resistance and (b) issues related to stagnation in productivity and its consequences for employment, real earnings and unity of the working people Apart from contemporary issues, the focus was also on the historical evolution of these movements The close links that these movements had with the larger socio political currents particularly the national movement emerged from the papers As a result these movements were not bound by narrow economism but were imbued with a wide perspective, a feature that had significant influence on the socio-political evolution of modern Kerala

The vibrant civil society in Kerala has facilitated the emergence and survival of a large number of cultural movements and groups which do not have direct political affiliation There was a separate session devoted to such movements The oldest and perhaps the richest of this tradition has been the library movement [60] There were a number of papers that analysed the experience of the popular science movement Kerala Sastra Sahitya Parishath (KSSP) [61] The literacy movement also drew the attention of a number of scholars [62] Many of these movements and groups address issues and problems that have not received adequate attention by the Left in Kerala and therefore, at times have proved to be controversial Some of the developmental initiatives of these movements like literacy resource mapping, village level planning, etc, have pointed to the untapped potential of local level human and natural resources to accelerate the developmental and democratisation process

It is the consciousness and struggles of the masses and not the manipulations of the politicians that will ultimately determine the issues in the political domain The sessions on 'Contemporary Politics' and 'Lessons of the History of the Left Movement in Kerala' drew attention to the above crucial link It was noted that the left movement in Kerala had entered a phase of relative stagnation from around the mid-70s with its electoral support still around the peak reached in 1961, approximately 40 per cent [63] A major barrier to the advance of the Left during the 1970s was the disunity among the Left parties, which has now been overcome From the 1980s, all the Left parties as well as some of the secular opposition parties have been united under the Left Democratic Front (LDF) which, despite its various problems, has proved to be a stable combination.[64] It was pointed out that the Left needs to make a reassessment of the changes in the objective conditions in Kerala economy and society Particularly the following points were mentioned the nature of agrarian question in the post-land reforms phase, the massive inflow of remittances and its socio-economic consequences, expansion of education and its impact on labour supply conditions and the regional implications of structural adjustment programme On the basis of such reassessment the Left needs to draw up a new agenda that is more responsive to the changed reality of contemporary Kerala

V
Towards a New Development Strategy

Nearly two dozen sessions dealing with agricultural and infrastructural development technological choice and environmental sustainability attempted to evaluate the present growth strategy and formulate alternative approaches Before we survey their broad findings the question of the feasibility of such alternatives has to be settled To what extent can a state in the Indian union pursue alternative development strategies? It must be admitted that the options are very limited The new economic policies of the central government are constantly eroding even the limited autonomy that exists [65] However to adopt a position that nothing can be done in the state until the national policies are reversed or till the revolutionary transformation of the system occurs would be defeatist It cannot be said that the potential of capitalist development has been exhausted To that extent economic space does exist and should be consciously utilised by the Left E M S Namboodiripad set the tone of the deliberations with the statement that 'within the limitations imposed by the global and national structures, we will have to find practical solutions to the problems that our state faces We cannot let the present situation drift we have got to reach a consensus as to what measures are to be adopted to accelerate economic growth without sacrificing the welfare gains and the democratic achievements of the past' [66]

Apart from a general session on 'Pattern of Industrialisation Problems and Prospects', there was also a separate session devoted to industrial sectoral studies The newly adopted industrial policy statement of the Kerala government was criticised for its misguided obsession with labour militancy as a stumbling block to industrialisation, its emphasis on privatisation and liquidation rather than reform and restructuring to deal with the problems of the public sector and its stress on financial incentives and fiscal concessions for industrial promotion rather than greater emphasis on the delivery system.[67] The labour militancy/high wage hypothesis for industrial retardation was the theme for a number of papers [68] There was no substantive data to support the high wage hypothesis in the modern industrial sector Inter-state comparison of strike-proneness indicated an improvement in industrial relations in the state from the mid-70s [69] The situation today is much better than the national average Interestingly, it was also demonstrated that industrial growth in the state is prone to political cycles — the upswings coinciding with Left governments The discussions also pointed to problems arising from multi-unionism and union rivalry Labour phobia continued to trouble the minds of entrepreneurs [70] Meanwhile managerial practices in the state's industrial concerns were found to be far from satisfactory [71]

The emerging perspective on industrialisation indicates the need to stimulate private investment, diversify the industrial structure strengthen inter-industrial linkages promote technological progress and improve productivity Of vital importance is a step up in central sector investment The new perspective calls for a labour-friendly approach in industrial relations and participatory management to develop a new work culture Multi-unionism is to be discouraged by giving recognition only to unions with a minimum worker support through secret ballot As regards the small scale sector, the emphasis is on organisational patterns like ancillarisation subcontracting or space-bound clusters of firms (industrial districts/parks) in areas where the state has comparative advantage in specific raw materials or skills Traditional industries are to be reorganised with emphasis on technological upgradation and product diversification A careful review of the ad hoc interventions that have been imposed in the product and raw material markets was also called for, The role of co-operative and public sector agencies in such a process of regulated modernisation was also emphasised

The infrastructural crisis which has emerged as a stumbling block to industrialisation requires urgent remedial measures [72] The session on 'Rail, Road, Air and Waterways' called for removal of the distortions in the transport mode mix It requires expansion of the railways and renovation of the waterways [73] In the context of growing international migration and tourist traffic, there is an urgent need to improve air transportation facilities [74] However the present campaign for three international airports is the best example of lopsided priorities Of greater importance would be the modernisation of the Cochin port It was pointed out that despite improvement in capacity utilisation, the total factor productivity of the port has been steadily declining [75]

The most critical infrastructure is energy supply Kerala with no coal or oil resources is dependent upon firewood for a major proportion of its thermal needs and hydel power for its electricity requirements The per capita electricity consumption in the state is one of the lowest in the country The state has been a power deficit region for more than a decade with demand steadily increasing Ongoing power projects are getting delayed with severe time overruns so that additional capacity generation has been negligible There was a consensus on (a) need to urgently increase the capacity of electricity generation in the state (b) diversify the sources of electricity and (c) minimise distribution losses Advantages could be harnessed through demand management Differences cropped up on the question whether immediate priority was to be given to a thermal project with shorter gestation period or on the Pooyankutty hydel project that was criticised for inadequate safeguards against ecological degradation None of the speakers however objected to hydel projects in principle Each project is to be judged on the basis of case by case analysis of merits and demerits

The deliberations on agricultural strategy reflected optimism arising from the recent improvement in performance and also fears of the implications of the new economic policies of the central government It was pointed out the structural adjustment in perennial-tree crop dominated agricultural sector would prove to be an extremely slow and painful process Since the possibility of extensive expansion of cultivation has been exhausted in Kerala improvement in productivity holds the key to agricultural progress [77] Cropwise productivity data show that there exists ample scope for such improvement It was held that the improvement in coconut productivity is of paramount importance [78] It would require a thorough re-evaluation of the irrigation strategy adopted in the state characterised by high cost canal irrigation schemes catering exclusively to dwindling paddy cultivation and that too with little concern for local level water control measures [79]

Kerala's undulating topography and natural endowments generate a wide spectrum of distinct micro environmental conditions that require local level planning and intervention strategies [80] Given the high soil erosion proneness and monsoon dependency, Kerala requires an integrated land and water management programme [81] Multicrop farmsteads are another feature of Kerala's agriculture that has been missed by policy-makers and planners [82] Two sessions on the generation and diffusion of agricultural technologies in Kerala brought out the significant gap between lab and land

The contemporary agrarian structure and its implications for productivity were another issue that received considerable attention The multiple sources of income for small landholders which eases the pressure to maximise production or even encourages withdrawal from labour-intensive agriculture, in the face of unfavourable conditions, called for innovative institutions There is need to fashion a consensus approach to (a) the emerging lease market in land[83] and (b) taking forward the experiment in group farming [84] Group farming was an innovative agrarian reform introduced by the last Left Front government to facilitate the small holders to reap economies of scale through collectively undertaking agricultural operations while land ownership continued to be individual based The evaluation of the programme indicates that after the initial success the initiative lost momentum the peasant and agricultural movements were not sufficiently involved the new UDF government was less than enthusiastic about its continuation and attempts to improve cultivation practices through integrated planning were inadequate [85]

Considerable attention was paid to the interrelationship between science technology and development It was the theme for one of the symposia The technological upgradation of the traditional industries and of even the existing modern industries was emphasised in the discussions It is in this context that the infrastructural weakness in several key areas of S and T programmes assumes importance The importance of quality of higher education and the need for an ambience of achievement and excellence was highlighted [86]

A refreshing feature of the deliberations on development strategy was the sensitiveness to environmental issues that they reflected It would appear that the environment development dialogue has passed the infantile stage of the either/or dichotomy The central concern was how to integrate environmental concerns with economic growth so that the development process becomes sustainable The session on Environmental Studies pointed to the problems created by unregulated conversion of paddy land to tree crops [87] issues related to resource depletion [88] water and industrial pollution[89] and new waste management problems generated by changes in the consumption pattern [90] The alarming decline in the forest cover[91] in the state demanded immediate intervention The struggle at Geerakapara where the entire local population, most of them settlers joined the protest against deforestation was described to be a significant turning point in the struggle for protection of the forests

VI
Education and Health

In the educational and health sectors there was the well articulated concern that the achievements of over a century of egalitarian growth are being dismantled The policy of privatisation through self-financing institutions disregarded the requirements of social justice and of creating and sustaining useful education for as wide a population as possible [92] Meanwhile in health, non-medical interventions such as in sanitation, nutrition, sewages and environmental upgradation as well as the earlier integrated approach with emphasis upon prevention of diseases are being neglected for the sake of high-cost curative medicine, particularly for degenerative diseases [94] There was an emerging consensus that these trends should be opposed On the other hand, there was also a perceptible awareness that (1) under the old system of distribution, these basic services have not reached all sections, (2) the quality of services rendered by public institutions has degenerated, and (3) there is need for diversification of educational and health services to cater to new requirements [95]

If we are to build upon the past achievements of Kerala, then there should be proper educational planning taking into consideration the requirements of national, regional and local development Admissions to the university level should be selective for specialised areas of studies and research (ensuring admission to all sections on merit through reservations subsidies freeships, scholarships, etc)[*] and those to the secondary level should be strengthened by identifying and introducing courses of high employability The lack of public financial resources may be taken care of by rationalising the affiliated colleges system, by making the university departments more autonomous and flexible rather than by investing in research institutions outside the university system, and by varied methods of generating greater internal financial resources Experiments such as school complexes[97] and 'vijnanolsavam' have already proved the viability of projects to improve the standard of education through community participation There are manifold problems associated with tribal and fisherfolk literacy which have to be tackled along with better use of primers, workbooks and neoliterate literature created with sensitivity to the problems of the marginalised sections [98] Existing movements like the library movement and their services should also be integrated in this effort Gender, communal and exploitative value biases that have crept into textbooks also received attention [99]

Appropriation of people's health by the medical profession and the health industry is happening in Kerala The direct medical expenditure per household and per person is now so high as to be beyond the reach of the common people [100] This is not only true of modern medicine but also of traditional medicine, which has the potential for a wide range of preventive and other applications such as in paediatrics and primary health care[101] and greater relevance because

to be significantly influenced by a generalised ayurvedic worldview.[102]

The KSSP health survey revealed the dimorphic nature of morbidity in Kerala.[103] The so-called high morbidity-low mortality syndrome generated considerable debate. It was argued that high level of morbidity is more a reflection of better health consciousness of the people.[104] Nevertheless, to the extent poverty-related diseases dominate the picture appropriate measures emphasising inter-sectoral health linkages are called for.[105] There was a general agreement that as in the case of education, the state needs to draw up a formal health policy that seeks to build upon achievements of the past. The emphasis of such a policy should be improvement in quality rather than quantitative expansion. The new health policy would[106] have to clearly define the role of the state sector, reorient the family welfare services, encourage novel ways of funding health care outside government allocation, emphasise para medical training, draw up a state level formulary and effectively decentralise the health care system.

VII
Decentralisation

An issue on which there was a consensus at the Congress was the imperative need for democratic decentralisation of administration and development planning. Being a precondition for the successful implementation of a participatory development strategy, it came to be referred to in every session related to development problems. A special session was devoted to review the experience of 'Decentralisation of Governance and Development in the State'. A startling finding was the relative backwardness of Kerala with respect to decentralisation, particularly when compared to states like Karnataka.[107]

The history of decentralisation in Kerala is a litany of frustrated efforts. The idea goes back to 1957-59 when the Administrative Reforms Committee recommended various measures towards devolution of powers. These suggestions could not be implemented because the government was dismissed by the central government. Though in 1967, 1979 and 1980 there were other efforts in this direction, a concrete advance could be made only in 1987-1991, when District Councils were created under the Districts Administration Act, with 18 departments and 143 subjects being allotted to them.[108] A high-power committee to suggest transfer of further powers and a Finance Commission for devolution of funds were also appointed. In 1991 elections were held and District Councils were in position but soon the state government changed and from that moment onwards, one by one, the powers of the councils were withdrawn and a number of schemes were scuttled. Even funds for establishment expenses were drastically reduced.

In spite of such difficulties several district councils planned and executed several imaginative schemes in areas like betterment of school education, raising finances for development work through the National Savings Scheme, preparation of district development plans, resource mapping, repairing of irrigation facilities, etc.[109]. In all these activities, the councils worked in close liaison with panchayats and people's organisations like the KSSP, thereby strengthening and widening community participation at the local level. Several case studies of local level development initiatives, most of them being sectoral interventions, were examined in a number of papers. Most important among them was the attempt of a village-level integrated planning exercise in Kalliassen under the Panchayat Level Resource Mapping Programme.[110] The programme attempts to create a comprehensive data base of village resources in easily understandable map-formats by volunteers drawn from the local population assisted by scientists. The data collection process itself is organised in such a way that it becomes a conscientisation campaign. Also a local group of development experts is crystallised. In Kalliassen the programme has moved from the stage of data collection to comprehensive planning and implementation with people's participation.[111] An impressive feature has been the active involvement of the village panchayat in the development programme. The discussions on this as well as other local-level development initiatives underlined the importance of new village-level institutions for sharing and regulation of resources.

The recent constitutional amendments have put decentralisation once again on the agenda.[112] Yet they suffer from some basic defects; for instance, no devolution of powers from the centre is envisaged and the rural-urban dichotomy is perpetuated. The present state legislation on decentralisation has made a mockery of the intentions of the central legislation and ignored the pressures for decentralisation from below. What is evident is the lack of political will, compulsions of coalition politics, sectarian interests and persisting bureaucratic hurdles in the way of effective decentralisation. There was criticism that even the left has not fully utilised its considerable political energy and organisation to mobilise the broad masses of people behind the ideal of decentralisation.[113]

VIII
Threat of Casteism and Communalism

The influence of casteism and communalism on the socio-political process was an important theme taken up by the Congress. Besides the sessions on 'Caste Structures and Social Process' and 'Caste, Community and Social Process' it also figured prominently in the discussions in the session on 'Issues in Contemporary Politics'.

As we have already seen, the emergence of caste and community based organisations and movements heralded the modern socio-political process in Kerala. While these movements were largely subsumed within the national movement in northern Kerala they continued to dominate political life in southern Kerala. The north-south divide in the relative influence of caste in socio-political life has survived to-date.

The leftists were by and large active in the various social reform movements and the nascent left movement actively supported the struggles of the lower castes. At the same time they also built up class and mass organisations irrespective of caste and community. The anti-caste struggle was independently raised from these new secular and left platforms as a part of the general anti-feudal task. The existence of such an independent platform and its active involvement in the anti-caste struggle facilitated the leftward shift of the masses as communal movements increasingly shrunk into sectarian shells dominated by elites with vested interests. The victory of the Communist Party in the first general elections to the state assembly and the formation of a government without participation of any casteist and communal group was the culmination of this secularisation process. The dialectics of this communal/casteist road to secular politics was a theme of discussion.[114]

In sharp contrast to the above process the period from mid-70s has been characterised by a resurgence of casteist and communal influence in the socio-political life of Kerala.[115] The story of this social retrogression remains yet to be fully analysed. It must be admitted that the material base of caste-communal divisions are being increasingly undermined. Class differentiation within caste and community groups and increased occupational mobility, partly due to the strong traditions of affirmative action, are important factors in this process. Yet the ability of the elites within various castes and communities to rally the masses around their sectarian slogans seems to have increased. The reasons mainly lie in developments within the political superstructure.

It was the Indian National Congress (INC) that resurrected moribund caste and communal groups in order to forge the grand anti-communist alliance of 1957.[116] As a result, the communists failed to gain a majority in the mid-term elections of 1961, despite improving their share of the popular vote. In the mid-term elections of 1965 the CPI(M) entered into an understanding with the Muslim League in order to break the anti-communist alliance in the special circumstances created by the split in the CPI and

the anti-communist hysteria generated by the India China conflict This understanding grew into a united front through the food struggles and the anti Congress popular upsurge during the next two years Thus the CPI(M) shared power with the Muslim League in the 1967 United Front government The Muslim League soon joined an anti-CPI(M) front with Congress along with some of the left parties The failure to effect any decisive shift in popular support in its favour despite the militant struggles and fears of the danger of semi fascist terror as in West Bengal prompted CPI(M) into an alliance with a breakaway faction from the Muslim League in 1974 Similarly a faction of the Kerala Congress was also brought into the Left Front Thus what in 1965 was a temporary electoral understanding over time developed into a political alliance

The political alliance with minority communal groups soon emerged as a major impediment to the efforts of the left to build up their independent strength in the minority communities It isolated the left from the progressive forces in these communities and enabled the fundamentalists and narrow communal elements to consolidate their position as spokespersons of the community The influence of Muslim League that was largely confined to northern Kerala spread to the south also The success of the Muslim League in bargaining with both the left and right fronts became a source of inspiration for various Hindu caste groups to enter into politics Even though the left steered clear of the various caste political outfits the Congress Party was only too happy to accommodate them The Congress alliance that won the 1981 election had perhaps the worst caste communal track record incorporating as the alliance did most of the caste communal groupings in Kerala But the left was handicapped in fighting the casteisation and communalisation due to its political alliance with a faction of the Muslim League An atmosphere of political cynicism was spreading among the people Most dangerous of all Hindu communalism began to gain support in the state riding on the crest of the Hindu backlash against minority communalism [117]

It was at this juncture that CPI(M) took a bold decision to end its alliance with all communal groupings in the state The decision proved to be a watershed in Kerala politics To the surprise of all the Left Front won the 1987 elections to the state assembly without help from any of the communal/casteist groupings The rising tide of communalism was checked But the unexpected defeat of the left in the 1991 election due to the passions aroused by the assassination of Rajiv Gandhi has been a major setback for the secular forces [118] The period since the formation of the present government has seen an ascendancy of caste and communal forces The communal passions aroused by the Ayodhya incidents and the caste confrontation on the question of reservation have further complicated the problems The threat posed by the casteist-communal forces to the radical and secular legacy of the state is a major challenge to the progressive forces in the state

IX
Religious Minorities and Progressive Movement

The phenomenon of communalism, however, should be considered distinct from religiosity While the communal elements in Kerala were in the forefront of denouncing the Congress [119] the Congress itself was attended by a large number of deeply religious persons including Nitya Chaitanya Yati the foremost contemporary exponent of Sree Narayana Guru's teachings Metropolitan Bishop Mar Paulos Gregorios of the Orthodox Church and more than a dozen Catholic priests and nuns including the leading theologian Samuel Ryan Thus the sessions on 'Religions and Social Change' and 'Ideas in the Context of Social Change' became the beginning of a new dialogue

The presidential address of E M S Namboodiripad had self critically drawn attention to the low level of influence that the left had among the believers in Muslim and Christian communities that constituted around 40 per cent of the state's population [120] This failure of the left movement was one of the most significant obstacles to be overcome for a political breakthrough in favour of the progressive forces in the state

The basic reason for the relative insulation of the religious minorities from the left movement is historical These communities did not experience the same kind of religious reform process that Hinduism in Kerala experienced from the late 19th and early 20th century It had been in the soil upturned by these movements and their radical currents that seeds of leftism sprouted and flourished However in the case of religious minorities the period under discussion proved to be one of greater institutionalism and inward orientation which were used in strengthening their bargaining capacity at the community interface

It is not our argument that there were no progressive religious traditions among Muslims and Christians Of particular interest in this context is K M Seethi's analysis of religious teachings of Vakkom Abdul Khader Moulavi who has been more famous as an associate of Ramakrishna Pillai the crusading editor against Travancore monarchy [121] Ramakrishna Pillai incidentally, was the author of one of the earliest biographies of Karl Marx to be published in any of the Indian languages Vakkom Moulavi held that the laws of Islam concerning temporal matters were not commutable and hence, depending on the conditions of time and place, they are subject to change. He emphasised the principle of 'ijthad ital' (independent judgment) against the Islamic fundamentalists But the reform movements led by progressive Ulamas best exemplified by Vakkom Moulavi never became the mainstream of the Muslim community, particularly in northern Kerala, where the sullen Muslim peasantry weighed down by the successive defeats of their numerous revolts against the British, adopted more and more self-defensive inward orientation The conservative Ulemmas throttled any attempt at reform and even shunned modern education [122]

The impact of colonialism and capitalist commercialisation on the traditional Christian community was a trend towards greater institutionalisation of the church Therefore the perspective of progressive Christian theological trends was initiated by the missionaries who operated on different sociological and theological premises from the indigenous Christians In fact a separate session was devoted to discuss the 'Missionary Interface with Kerala Unlike the "inward looking samudayam consciousness of the largely upper caste Syrian Christian community [123] the missionaries focused on backward castes and contributed significantly to their social awakening At the same time missionary activities were intertwined with colonial intervention and therefore had a conservative edge that blunted their emancipatory potential [124]

Given the orthodoxy of the religious minorities the left discourse laced strongly with profound atheism and ridicule of religion [125] a heritage of the bourgeois rationalist currents in the social reform movements failed to strike sympathetic notes Instead it facilitated the vested interests of the top hierarchy of these institutional religions to divide the people into believers and non believers even on matters of temporal life It was on the alleged communist threat to religion that the Christian and Muslim masses were mobilised in 1957-59 in the infamous liberation struggle' to scuttle the land reforms, minimum wage legislation and educational reforms of which the very same masses would have been the direct beneficiaries Ever since then the Church has attempted to resurrect the believer-nonbeliever divide as the central issue in every election in the state [126] The attempts of the left to break down this compartmentalisation have also not been helped by the bourgeois rationalist approach rather than the historical and dialectical approach to religion that the left has tended to adopt

In an important contribution to the Congress, F Houtart and G Lemercinier undertook a sociological analysis of religion in Kerala and discussed how its social function has tended to change over historical periods.[127] As was discussed earlier, the first assault on feudalism in Kerala was under-

taken in the religious garb by socio-religious movements from the latter half of 19th century It was pointed out that "recognition that there is also a spirituality that is transformative and socially relevant is crucial for any Christian Marxist dialogue [128] The emergence of liberation theology within the church and struggles for justice and equality like the struggle of the fisherfolk in the Latin Catholic Church[129] and the Faith Movement in the Church of South India are slowly but surely preparing the basis of a new dialogue The institutional church has also been keeping away from overt and direct intervention in day to day politics [130] Changes are also discernible among the Muslim community particularly in the post Ayodhya situation opening doors for co operation between devout Muslims and communists Hindus gurus like Nitya Chaitanya Yati have refused to join the conspiracy to institutionalise Hindu religion and fan Hindu religious fanaticism The need for a new encounter between religion and Marxism based on mutual respect and critical opinion was a recurrent theme of many of the papers presented at the Congress

Gender Question

The status of women in Kerala society was the focus of a lively and involved debate at the Congress We have already noted the role of women's agency in the making of the Kerala model Female literacy has been the key variable in the advance of health status and in turn the transition in demographic indicators Women in Kerala are as literate and healthy as the males and not victims of the worst forms of gender discrimination as in most parts of India Kerala is the only major state in India where the sex ratio is favourable to women — 1 040 females to 1 000 males against an Indian average of 928

The above is no small achievement and should not be trivialised But can this be the basis for considering that women in Kerala are empowered or liberated? In response to the tendency to make sweeping statements on the empowerment of women on the basis of the indicators of education health fertility, etc, and stylised features of matrilineal institutions and its remnants the following three socio economic phenomenon were highlighted

(1) Despite higher education and low fertility rate the visible female work participation rates is one of the lowest in the country Open female unemployment is very high [131] High incidence of unemployment of women has been an important factor influencing the withdrawal of women from the labour force Majority of women who are employed are concentrated in low paying, unskilled or semi-skilled and casual employment There has been a strong tendency for feminisation of poverty and the number of female-headed poor households has been sharply increasing [132]

(2) Despite the higher level of education and participation in grass roots-level movements, women are conspicuously absent in the higher levels of decision-making Even in mass movements where membership is predominantly of women, representation of women in the leadership is marginal [133]

(3) In the recent period there are visible and disturbing signs of erosion of progressive attitudes to gender issues like the spread of dowry system purdah among Muslims, degrading depiction of women in the mass media sexual harassment and violence [134]

Why are historical traditions of matriliny, higher female educational and health status and the spread of the left movement not successful in empowering women in Kerala? Three sessions were devoted explicitly to gender related issues matriliny and modernity social construction of gender and feminisation of poverty A major gap was the absence of papers on women's movements and groups in Kerala

The session on matriliny and modernity explained in some detail the construction of gender historically What advantages if any did the matrilineal system provide women? An answer is rendered difficult given the fluidity and flexibility of the system [135] There was a general consensus that it offered greater freedom and security to women in comparison to other agrarian societies that were patrilineal [136] The above positive features of matriliny also contributed to widespread progressive attitudes towards female education and survival These influences have continued to survive formal changes in law [137]

But one has to guard against orientalist romanticisation of matriliny as an age of gender equality women were ultimately subjected to the authority of the male head of the joint family [138] The Nair matriliny survived as a facilitator of the extreme patriarchy of Brahmins Further matriliny was imbedded in the general ethos of feudal decadence

The development of capitalism tended to undermine the economic structures of joint family as its customs and traditions stood in opposition to individual initiatives and incentives for accumulation Feudal decadence gave romantic love and nuclear family an aura of idealism The critique of the *ancien regime* carried out by the social reform movements was thoroughgoing and facilitated legal enactments dismantling the traditional system with little social opposition But the emerging critique suffered on two counts it condemned the feudal past from the bourgeois standpoint and discourse was dominated by males with little recognition of the positive aspects of traditional matriliny [139]

The anti colonial and anti-feudal mass movements that emerged in the post first world war period further expanded democratic public sphere where the oppressed castes and classes had greater possibilities of articulating their concerns and needs [140] Women, through their participation at varied levels in struggles, organisations and popular discourse, emerged as an important constituent of the public sphere But the system of decadent feudal norms was followed by the idealisation of the patriarchal nuclear family and neglected the rising bourgeois familial ideology [141] No rigorous left critique of bourgeois patriarchal familial values or the persistence of feudal influences made their appearance in spite of the ideological hegemony of the left in the 1950s and 1960s The undermining of this hegemony and degeneration of the popular culture and ascendancy of consumerism has led to acceleration of commodification of women in media and erosion of progressive attitudes to gender issues in general

The session on social construction of gender revealed several constituents of patriarchal ideology that have been deeply embedded in Kerala society and political culture They called for a re-evaluation of the movements institutions customs and traditions from a gender perspective and development of a thoroughgoing critique of the patriarchal ideology from the positions of the left Similarly the economic marginalisation of women in the economic development process calls for a re-examination of the development policies [142] It is not sufficient to have women targeted in special programmes but the development policy at large has got to reflect a sensitivity to the gender issue

Many of the above issues are closely connected with contemporary developments in the cultural sphere The long history of popular culture in the state is now in danger of being subsumed or submerged by the emerging mass culture [143] The difference between popular culture and mass culture is that popular culture is rooted in the lives and experiences of the people, particularly the subaltern classes of the people, while mass culture is dominantly a product of the mass media Popular culture predominantly reflects disenchantment and struggles, not that it does not encompass a way of life also The left should take a positive stand in this matter and lay claim to the tradition of popular culture which can be a stimulating and effective undercurrent of contemporary struggles

The defect in executing such a perspective is in assuming all elements of popular culture, including popular religion, to be unidimensional — that of struggles against the establishment Within the broad area of cultural expressions, various experiences of peoples' lives can find expression, including that of the non subaltern classes Only on the basis of the inherent unity at that level could a phalanx of cultural defence be forged against

the creeping in of mass culture. In the spirit of cultural-subaltern purity, genuine opposition to mass culture can degenerate into sectarian disputes, hampering such unity. It also must be stated that there were comments that the treatment of the contemporary cultural crisis was neither comprehensive nor deep enough, even though a dozen sessions were organised around various themes related to culture and literature and various cultural events were organised along with the Congress.

XI
Conclusion

The International Congress on Kerala Studies was not merely a stock-taking. It was a major initiative to facilitate the interaction of scholars from various academic disciplines and practical activists. On the basis of such an interaction it was hoped to move towards a new agenda for the state, particularly in the sphere of development action. The response to the first objective was unprecedented and is reflected by the large number and wide range of participants and papers contributed. These papers and discussions are a veritable compendium of Kerala studies.

The experience of Kerala shows that the conditions of life of the people can be improved even at low levels of economic development through appropriate public action for social provisioning and redistribution. The mass of Indian people do not have to necessarily wait for an indefinite future for the hump of economic growth to be crossed for schooling, house sites, primary health care, food at fair prices and so on. The struggle for basic needs is an important component of social mobilisation strategies. The contemporary crisis that Kerala faces, nevertheless, underlines the limitations of what can be achieved within the present system. It also shows that in the absence of economic growth it is difficult to sustain, much less expand, these welfare gains. The challenge before the domestic forces is to enlist the increased political consciousness and organised strength of the people as an instrument to accelerate economic growth in a democratic fashion. Corrections to the various distortions in the social and cultural areas are also required.

Through the dialogue at the Congress certain broad perspectives have emerged without necessarily a formal consensus. Some important questions were indeed left open and unconcluded. An overwhelming feeling among all participants was that the process of dialogues should continue. Bishop Paulose Mar Gregorios was speaking for all when he in his valedictory presentation appealed that the Congress should be regarded not as the conclusion but as the beginning of a long dialogue. The proposal of the organisers to publish full texts of selected papers in thematic volumes would certainly be an important contribution in this direction. Further, a series of thematic state-level workshops and seminars are being planned to undertake in-depth discussion of selected papers and move towards more concrete policy perspectives. It is hoped that by the end of 1995 or the first half of 1996 the dialogue would have developed to such a stage so as to facilitate integration of these policy perspectives at district and panchayat levels taking into consideration the concrete local conditions so that integrated area-specific development perspectives to emerge. Such a programme arrived at through the widest possible dialogue and participation of different sections and enjoying the support of a wide spectrum of intelligentsia would contribute to raising the level of political discourse in the state to pitches qualitatively different from the present, facilitate the breakdown of the two-front compartmentalisation of state politics and, along with others, also contribute to the further advance of the democratic forces in the state.

Civil Society and Nation State

In Context of Globalisation

Ajit Roy

The problematique of the recent interest in civil society is how the latter can defend its autonomy against the many forces that are eroding its autonomy. To understand this problematique this paper first attempts to delineate the processes of globalisation and then to develop an approach to understanding the concept of civil society, before evaluating its contributions to the struggle against globalisation.

THE role of vibrant civil society came into sharper focus in theoretical-academic discussions as well as social political activity about a quarter century ago. The impetus in both spheres was received more or less simultaneously. Moreover, the two dimensions of development interacted with each other from an early stage. The theoretical interest evolved out of the revelation to a wider readership of Antonio Gramsci's thought in general and his attention to civil society in particular. The Gramscian universe of discourse covers the actual and potential roles of civil society as well as the allied question of the dialectic of its development. The social-political practical aspect came to the fore with the irruption of vast popular activism in various parts of the world more or less simultaneously in the late 1960s. One very significant feature of this phenomenon which subsequently influenced its conceptualisation considerably was its rootedness in the soil in each case while at the same time revealing an attitude of conscious confrontation with global forces and issues in most cases. In retrospect, it may be imagined that the participants had sensed, vaguely at least, the advancing process of globalisation embracing the socio-economic and political dimensions of human existence in the extant reality. And, in the process of conceptualisation and elaboration of this developing reality, Gramsci's insights on the role and dynamics of civil society increasingly assumed a central place.

Today, as we approach the mid-1990s, globalisation is no longer a theoretical concept or construct: it is an indisputably solid, glaring reality, impinging upon almost every aspect of human existence - environmental, economic, political, cultural and so on. The coinage, 'global village', to denote the present-day world is a commonplace truism today. It is also widely seen that the motive power of this process is provided by the multinational or transnational corporations or global companies which are seen to be "driving the world towards commonality, speeded by mass communi-cation, transport and travel".

This indeed is the global reality today which has critically altered and is steadily altering the role of the nation-state. More specifically, this process is subverting and circumscribing the powers, reach and even orientations of the nation-state - needless to say not in the sense of liberating the people from the oppression and exploitation of the dominant power-structure, but only substituting their subjugation, from the more direct, easily identifiable and confrontable forces to indirect, often invisible and always remote centres of domination.

This is the context in which the new interest in civil society assumes its present importance. The relative autonomy of civil society – that is, various communities and collectives of the people, often informal and inarticulate, within a particular political structure – is being perceptibly eroded by the advancing process of overbearing economic, political and cultural influences of remote forces beyond, at least, their palpable reach. How to defend themselves against these encroachments and how to beat back these encroachments in order to expand the space for their own articulation and action – this is the problematique of the new interest in civil society.

In order to understand and deal with this problematique, we have to, first, clearly understand the origin, development and features of the phenomenon of globalisation, and, second, define the approach to an understanding of the concept of civil society. And we have to tackle both of these tasks historically, even if somewhat schematically, within the constraints of the present paper. This is what we attempt to do below, before we finally try to formulate the prospects and potentialities of vibrant civil society and its contributions to the global struggle against globalisation under the domination of global companies and their agencies.

I

Globalisation which has now become the supreme catchword of the high priests of capitalism the world over, is, however, not really a new development. It is inherent in the organic logic of capitalism. All of its principal elements were succinctly enumerated a century and a half ago. For instance, *The Communist Manifesto* stated:

> Constant revolutionising of production (and) The need of a constantly expanded market for its products chases the bourgeoisie over the whole surface of the globe. It must nestle everywhere, settle everywhere, establish connections everywhere.
>
> The bourgeoisie has through its exploitation of the world market given a cosmopolitan character to production and consumption in every country. It has drawn from under the feet of industry the national ground on which it stood. All old national industries have been destroyed or are daily being destroyed. They are dislodged by new industries, whose introduction has become a life and death question for all civilised nations, by industries that no longer work up indigenous raw material, but raw material drawn from the remotest zones, industries whose products are consumed not only at home but in every quarter of the globe. In place of the old wants, satisfied by the products of the country, we find new wants, requiring for their satisfaction the products of distant lands and climes. In place of the old local and national seclusion and self-sufficiency, we have intercourse in every direction, universal interdependence of nations. And as in material production, so also in intellectual production.[1]

The secret of this achievement, the *Manifesto* held, lies in "the rapid improvement of all instruments of production, and by the immensely facilitated means of communication".[1]

Even 'consumerism', the hallmark of present-day globalisation was not overlooked in this pathological dissection. *Excess and intemperance*, Marx wrote even earlier,

> come to be its [capitalism's] true norm. Subjectively, this is even partly manifested in that the extension of products and needs falls into *contriving and ever-calculating* subservience to inhuman, refined, unnatural and *imaginary* appetites. . . and no eunuch flatters his despot more basely or uses more despicable means to stimulate his dulled capacity for pleasure in order to sneak a favour for himself than does the industrial eunuch – the producer – to sneak for himself a few pennies. He puts himself in the service of the other's most depraved fancies, plays the pimp between him and his need, excites in him morbid appetites, lies in wait for each of his weaknesses ...[2]

Even the phenomenon of the MNC or global company which is perceived as the principal architect of the 'global village' of today was not beyond the anticipation of the founders of Marxism. The tendency towards concentration and centralisation – the basic law of capitalism leading to the growth of monopolies and world cartels which have reached the pinnacle of development in the form of the MNC or global company today – was clearly formulated by Marx in his magnum opus *Capital*, and this analysis was carried forward by Lenin in his work *Imperialism – The Highest Phase of Capitalism*, written in 1914.

These tendencies noted by Marx were not supposed to follow a path of clear cut and linear advance. The growth of capitalism, although a global system in its essence, has taken place historically within the framework of nation-states, and world monopolies have developed through an interplay of mutual struggles and collaboration of huge national conglomerates. The spectacular advance of globalisation notwithstanding, these conditioning factors continue to operate today, if only in a relatively lower key, and will in all likelihood continue to do so in the future too, as long as capitalism survives.

Needless to say, the capitalist globalisation of today is far removed from the universal development of humans envisaged by the founders of Marxism and all true humanists, as this overcoming of local and national limitations under capitalism is based on "shameless, direct, brutal exploitation" and under this dispensation, there is "no other nexus between man and man other than naked self interest, than callous cash payment".[1]

To come now to the MNC or TNC (transnational corporation is perhaps a more appropriate term), the central force behind the present level of globalisation, its position today was delineated by the present writer in a recent article as below:[2]

> The number of TNCs, according to the UNCTAD, has shot up from 7,000 to 37,000 in the past two decades, and their direct foreign investment (FDI) today amounts to US $ 2 trillion. Of this, however, only about a hundred top TNCs, or about 0.003 per cent of the total number of the TNCs, account for US $ 660 billion or about one third of the total FDI for all the TNCs. About one-third of the world exports in goods and non-factor services today take the form of intra-firm trade between the parent firm and their foreign affiliates. Two other characteristic features are:
>
> (1) Almost one half of the FDI stock of TNCs in developed countries in 1990 was in the services sector, while manufacturing accounted for the largest sector in the developing countries. In other words, cheap labour and natural resources along with unconcern for environmental pollution in the developing countries have persuaded the TNCs to shift a large share of their investment allocation to the latter.
>
> (2) TNCs are building up integrated multi-tier networks embracing parent firms, their foreign affiliates, firms linked through sub-contracting, licensing and similar contractual arrangements and firms tied together through alliances. These networks include all major corporate functions, such as research and development, manufacturing, marketing, finance, accounts, and so on, and they embrace both the developed and developing worlds.
>
> It should be added that the powers of these top TNCs have become much more consolidated by their close alliance with multinational banks (MNBs), which have become tremendously powerful in recent years, and with the assistance and collaboration of international institutions like the World Bank and the IMF. With the revolutionary changes in telecommunications and information technologies, these top centres of financial and corporate control can today easily bypass the regulations of national states and can manipulate the movement of finance, credit and various other resources on a global scale in the interest of their own profits and power.
>
> The globalisation of production and marketing functions in the new era is graphically exemplified by the following case:
>
> > Some models of the Honda automobiles are designed in Japan and assembled in the United States with American labour and with parts manufactured in Europe, the US and Japan. Is this Honda a Japanese car? In truth it's a global car coming from a Japanese company which has become a global company. The rise of global marketing has come from the rapid global expansion of multinational companies like Honda".
>
> Global operations of the TNCs in manufacturing and marketing are accompanied by vital changes in many other areas. First, there is a growing shift from the manufacturing to the services production. About 60 per cent of the total employment in developed countries is now provided by the services sector. The same trend is seen in the developing countries too. According to an estimate, the travel and tourism industry today is generating more than US $ 3,500 billion or about 6 per cent of world GDP. Presently, it employs 127 million or one of every 15 persons in the world. In other words, instead of providing food, clothes, shelter, etc, to the millions and millions of the hungry, naked and roofless population of the world, the economy is getting increasingly geared to catering to the fancies of the affluent.
>
> Second, even in the sphere of material production, arms production and arms trade occupy a major place, notwithstanding the collapse of the rival power system and the proclaimed end of the cold war.
>
> Third, the working of the globalised economy is leading to a continuous and growing impoverishment of the extremely poor developing countries through the rising deficit in the balance of trade and debt burdens.
>
> All this is accompanied by environmental pollution and cultural degradation on massive scales. The TNCs in their lust for more and more profits are systematically denuding the forests, exhausting the irreplaceable resources of the planet and polluting the land, water and air of the world – more so of the developing and dependent parts of the world.
>
> An inseparable counterpart of these developments is the pollution of humanity – through the spread of drugs, crimes, sex and so on – accompanied by the growing scourge of AIDS. This human pollution has been facilitated by the infection spread through the powerful electronic mass media like films, TV, video and so on, which has followed the technological advance represented by the development of the microchips. Satellite transmissions have spread and are spreading the germs of infection all over the globe instantaneously. This is both a gift and a creator of globalisation. This cultural inundation has two inextricably intermixed objectives. First, it is aimed at promoting consumerism and thereby expanding markets for mass produced commodities. Second, through this indirect process of commercial bombardment, accompanied by ideological brainwashing, it aims at diluting and dispersing critical and combustible sentiments of the people. Indeed, it aims at implanting in people's minds bland, illusory and often downright false and reactionary perceptions of national and international environments.
>
> Decades ago, the *New York Times* carried a full page advertisement which, along with a visual carried in capitals almost an inch high, the *first commandment* of the new era, Create More Desire'. Capitalism in general and its latest and most powerful protagonists, the TNCs, in particular have developed advertisements into a most effective socio-political global influence. Originally based on the economy's requirement of establishing linkage between scattered consumers and mass produced commodities, advertisements have today developed into a fine 'art', and advertising itself is an immense industry for manipulating the mass mind. "This apparatus", Lucas rightly said some years ago, "now dominates all external life from presidential elections to the consumption of ties and cigarettes".[3]
>
> In the course of this development, advertising 'art' has given birth to what one German philosopher calls 'commodity

aesthetics', in which, the commodity is created in the image of the consumer's desire. Later on, this image, divorced from its commodity, is the subject of advertising promotion" [10] In the course of developing this 'art' based on commodity aesthetics, these 'artists' have developed sexualisation in this craft

> The suppression of instincts plus the simultaneous illusory satisfaction of instincts tend towards a general sexualisation of the human condition The response of the commodities is to reflect sexual images from all sides Here it is not the sexual object which takes on commodity form, but the tendency of all objects of use in commodity form to assume a sexual form to some extent [11]

The overall "strategic task of the 'mass culture' is to develop consumer instincts in the people to the utmost, to transfer the people's consciousness on to philistine, narrow-minded lines, to emasculate as far as possible the socio-political activity of mass consciousness, and to divert people from advanced social ideals" [12]

The central objective and resultant of the operations of the modern mass media mechanism is to emasculate civil society As C Wright Mills pointed out years ago, under the new dispensation

> there is a movement from widely scattered little powers and *laissez faire* to concentrated powers and attempts at monopoly control from powerful centres And in both centres, economic and opinion, power is partially hidden, they are centres of manipulation as well as of authority
> In the simple democratic society of primary publics, competition of opinions and ideas goes on between people holding various views which service their special interests and their reasoning But in the mass society of media markets, competition goes on between the crowds of manipulators with the mass media on the one hand, and the people receiving their communication on the other 'Answering back' by the people is systematically unavailable.[13]

The aim of the manipulators (Mills concludes) is to keep the underlying population in continuous emotional subjection, this being more important than the inculcation of specific beliefs; for, if the frame of the mind is set for docility in opinion, for obedience in will, the people will be ready to believe and to feel any number of specific beliefs. In this the regimenters work deeper than specific views and emotions: they are trying to modify the basic ideological predisposition of the person. And they want to do this on a mass scale: to make all the population alike in their ideological predisposition, in order that they will all think as it is desired that they think. So the volume of assertion becomes 'stunning'; from all sides and through all senses it converges on the isolated individual. All power and all social initiative is exercised from above downward.[14]

For decades past, this domination of what has rightly been called 'cultural imperialism' flowered in the US through the development of the most advanced information media and techniques and was utilised to extend its grip over the world Not only the developing countries, even the most advanced capitalist countries did not escape its reach According to one source, in the mid-1980s about one-third of programmes screened on west European television were made in the US Even in a country like France, so proud of its national culture, 70 per cent of feature films screened in that country were foreign made, mostly in the US About 75 per cent of publicly performed musical shows in Sweden were imported from the US also [15]

The expansion of the mass market under capitalism along with the development of mass culture and mass media, has historically been steadily encroaching upon the sensibilities and activities of civil society The structural progress of capitalist concentration leading to the rise of TNCs to a highly dominant position in economic terms accompanied by the revolutionary leap in information technologies has created the present situation, in which the space for civil society everywhere in the world, has been squeezed into extremely narrow proportions These days, decisions are imposed, actions restricted by manipulations into wrong or inane channels Even thought and sentiments are sought to be tightly controlled from centres, not only remote from the people, as it has been for decades, but in the final analysis from outside the country's frontiers

Significantly, however, this regime of extra-national or supra-national control economic, political and ideational - is not something that suddenly caught an unwary world in its net The supra-national philosophy - if that is the right word - behind the fast advancing process of politico-economic-ideational globalisation was proclaimed by the high priests of this tendency years ago from the house tops, so to say Twenty years ago, a seminal and authoritative work[16] on the subject quoted extensively from the proud pronouncements of the topmost executives of the topmost TNCs of the world about their perceptions of and intentions about the developing 'globalised world', and more than 10 years ago, the present writer extensively quoted from that work to underline the significance of this development. Some excerpts are quoted below

> 'For business purposes', says the president of the IBM World Trade Corporation, 'the boundaries that separate one nation from another are no more real than the equator The world outside the home country is no longer viewed as a series of disconnected customers and prospects for its products, but as an extension of a single market'.
> 'The political boundaries of nation states', declares William I Spencer, president of the First National City Corporation, which does business with 90 countries, 'are too narrow and constricted to define the scope and sweep of modern business' For George Ball (former US under secretary of state), 'the world corporation is planning and acting well in advance of the world's political ideas', because it is 'a modern concept designed to meet modern requirements' The nation state unfortunately is 'a very old-fashioned idea and badly adapted to our present complex world'
> 'The critical issue of our times', says Maisonrouge (a top US technocrat), 'is the conceptual conflict between the search for global optimisation of resources and the independence of nation states
> *Business International* warns, 'the nation state is becoming obsolete tomorrow in any meaningful sense it will be dead and so will the corporation that remains essentially national
> (As the large US corporations and banks earn more than 50 per cent of their profits overseas) the US-owned and managed global corporations have transcended their own country's interest, outlook and strategy' [17]

A most crucial distinction between the operations of the present-day global corporations and the old style imperialist formations, that has important socio-political implications, follows from this transcendence of the narrowly national perception by the global corporations They are now capable of becoming relatively more accommodating to sections of the overseas capitalists Their present economic and political strategies permit, even enjoin them to coopt and integrate, of course at a subsidiary level, sections of the bourgeoisie from their overseas fields of operation This is done in three ways, first, the local bourgeoisie may now get a small share of the profits and revenue, second, this enables the local bourgeoisie to achieve a limited degree of expansion of their economic activities, and third, this leads to an expansion of the elitist stratum which tends to think that they are gaining through this global association by way of relative affluence and a flood of sophisticated goods with which to pursue a high lifestyle; through these and other means like cultural assaults on the local population that go along with these operations, they increase their capacity to extend their social base - in both urban and rural sectors - by integrating 10, 15 or even 20 per cent of the country's population into their socio-political-cultural system.

The shock waves that these developments administer to local civil society are as intense as they are varied and pervasive Before we seek to study them, we should first try to define our approach to, and understanding

of, the concept of civil society in general terms, necessarily briefly, within the scope and constraints of the present exercise.

A word of caution here. It would be extremely simplistic to believe that transcendence of national limitations has been or can soon be fully achieved. The foregoing analysis is intended only to highlight an ongoing process whose progress is very uneven over time and space. It should not also be forgotten socio-political institutions, and culture based on them, enjoy some autonomy. The powers of political parties, politicians, institutions such as parliament, government, bureaucracy and so on, are directly correlated with the political independence of the state. Hence, these institutions may not readily abdicate the vantage position they occupy in a nation state. Moreover, it should be remembered that even through centuries of evolution, nation states have seldom, if ever, been able to overcome fully local, regional and other forms of parochial pull. Hence there will continue to be tensions between the tendency toward supra-national domination and attachment to national identity.

II

'Civil society', so much in vogue today, is an old theme, originating as it did with 17th century political philosophers such as Thomas Hobbes and John Locke. The concept assumed sharper focus in Hegel's writings and subsequently in Marx's critique of them, but was therafter relegated to the background till Gramsci took up this subject in his prison writings.

Without using the term directly, Hobbes defined civil society as the area "wherein the liberty of a subject lieth... only in those things which in regulating their actions, the sovereign hath pretermitted: such as is the liberty to buy, and sell, and otherwise contract with one another; to choose their own abode, their own diet, their own trade of life, and institute their children as they themselves think fit; and the like", without, however, limiting the "sovereign power of life and death".[18] In Locke's conception, civil society has two dimensions. On the one hand, it provides redress and security against anarchy and arbitrariness of the 'state of nature', and on the other, through the devolution of legislative powers "in collective bodies of men, call them senate, parliament or call what you please", gives them (the population) security against the arbitrariness of the government.[19]

If we leave aside the latent philosophical thrusts, Hegel's concept of civil society in plainer terms embraces the realm of economic interests, labour, private property and class distinctions, which Hegel characterised, after Hobbes, as "the war of all against all". Essentially, civil society in Hegel's terminology simply refers to the totality of the material conditions of life. While conceding the duality of political society (the state) and civil society (material conditions of life), Hegel lays down that concrete freedom consists in their identity:

> In contrast with the family and civil society, the spheres of private rights and private welfare, the state is from one point of view an *external necessity* and their higher authority, its nature is such that their laws and interests are subordinate to it and dependent on it. On the other hand, however, the state is their *immanent* aim; its strength lies in the unity of its universal end and aim with the particular interest of individuals.[20] The paragraph above [according to Marx's interpretation] informs us that *concrete freedom* consists in the identity (to be achieved on both sides) of the system of particular interests (of family and civil society) with the system of general interests (of the state).[21]

Marx and Engels, on the other hand, give an independent identity to civil society, that is, they refuse to concede the fundamental identity of the state and civil society. As they say in *German Ideology*,

> Civil society comprises the entire material interaction among individuals at a particular evolutionary stage of the productive forces. It comprises the entire commercial and industrial life of a stage and hence transcends the state and the nation even though that life, on the other hand, is manifested in foreign affairs as nationality and organised within a state. The term 'civil society' emerged in the 18th century when property relations had already evolved from the community of antiquity and medieval times. Civil society as such only develops with the bourgeoisie. The social organisation, however, which evolves directly from production and commerce, which in all ages forms the basis of the state and the rest of the idealistic superstructure, has always been designated by the same name.[22]

While underlining the historical continuity of civil society in general, Marx makes a fundamental distinction between the *old* civil society and the *new*. Under feudalism,

> The old civil society had a *directly political* character, that is, elements of civil life such as property, the family, the mode and manner of work, for example, were raised into elements of political life in the form of landlordism, estates and corporations. In this form they determined the relation of a particular individual to the *state as a whole*, that is, his political relation, his separation and exclusion from other parts of society. For the feudal organisation of national life did not elevate property or labour to the level of social elements but rather completed their *separation* from the state as whole and established them as *separate* societies within society. Thus the vital functions and conditions of civil society always remained political, but political in the feudal sense. That is, they excluded the individual from the state as a whole and transformed the *special* relation between his corporation and the state into his own general relation to the national life, just as they transformed his specific civil activity and situation into a general activity and situation.
>
> The political revolution, which overthrew this domination, turned the state into the people's business and made the political state the business of all... this revolution inevitably destroyed all estates, corporations, guilds and privileges variously expressing the separation of the people from their community. The political revolution thereby *abolished the political character of civil society*. It shattered civil society into its constituent elements – on the one hand *individuals* and on the other the *material* and *spiritual elements* constituting the vital content and civil situation of these individuals. It released the political spirit, which had been broken, fragmented, and lost, as it were, in the various *cul-de sacs* of feudal society. It gathered up this scattered spirit, liberated it from its entanglement with civil life, and turned it into the sphere of the community, and the *general* concern of the people ideally independent of those *particular* elements of civil life.[23]

Marx demands the abolition of the antithesis between political society (state) and civil society through the abolition of both. This is to be achieved by the introduction of unrestricted voting as a means to the fullest extension of democracy, which he broadly equates with the transition to socialism. The essence of this perspective is formulated in his 'Young Marx' idioms:

> All emancipation is *restoration* of the human world and the relationship of *men themselves*. Political emancipation is a reduction of man into a member of civil society, to an *egoistic independent* individual on the one hand and to a *citizen*, a moral person on the other. Only when the actual individual man has taken back into himself the abstract citizen and in his everyday life, his individual work, and his individual relationship has become a *species-being*, only when he has recognised and organised his own powers *social* powers so that social force is no longer separated from his as *political* power, only then is human emancipation complete.[24]

As mentioned earlier, it is Antonio Gramsci whose writings have created the new interest in 'civil society' and its role and potentialities in contemporary socio-political life. Gramsci's contributions to this concept have two distinctive aspects, not explicit in either Hegel or Marx. These are, (1) interpenetration of political society and economic society, or the state and civil society, and (2) a recognisable autonomy of civil society which gives it a distinct space for operation and

development. According to Gramsci, there are "two major superstructural 'levels': the one that can be called 'civil society', that is the ensemble of organisms commonly called 'private', and that of political society' or 'the state'."[25]

Gramsci used this concept in his elaboration of politics *vis-a-vis* a number of distinct spheres, such as his conception of hegemony and domination, war of position and war of manoeuvres, role of intellectuals, Jacobinism, passive revolution, and so on. It is beyond the scope of this exercise to give an exposition of his rich views. The operational implications of Gramsci's concept of civil society were formulated by the present writer some years ago in his monograph on Gramsci (in Bengali) as below:

> The expansive structures of a modern state which includes state institutions as well as organisations of civil society resemble the 'trenches' (in the fortification of a country's war front) in the sphere of practical politics and serve as secure defence system in a war of position. In the previous era, the war of manoeuvre which used to extend almost throughout the warfront now seems to have been reduced to partial war.
> In simpler terms its essence is: because of expansion of civil society, the role of direct revolutionary uprising has become relatively reduced. In other words, without sufficiently reducing the ethical-ideological influence of the ruling class by waging war of position within various institutions of civil society, it will not be possible either to prepare for a revolutionary uprising, or to ensure the final victory of a successful uprising.[26]

With this theoretical exposition of the origin and development of the concept of civil society, we can now proceed to our concluding section about the contemporary problems of civil society and the evaluation of one of the major viewpoints about it.

III

There is a proliferation these days of contributions on the various aspects of the problematique of civil society. While there is a general agreement about the diversity, role of local initiative and greater autonomy in the development of movements in civil society that goes under the general label of social action, sharp controversies, however, rage over the question of their essential politics, if we ignore the view that it is altogether non-political. Instead of wading through the huge body of literature available today on the subject, I have chosen to concentrate on three or four well-articulated essays, which are themselves based on wide surveys of available material.

To take a prominent contribution, although it does not use the term 'civil society', 'Nine Theses on Social Movements' by Andre Gunder Frank and Marta Fuentes actually deals with important issues related to the actions of civil society. It is a good descriptive piece which ties together various strands and streams of contemporary autonomous mass movements in various parts of the world and draws nine generalisations from the survey. Taken separately, Frank and his colleague are mostly correct in their observations except on two issues. First, though these movements may have started locally and in isolation from one another and even with objectives of some immediate defensive or offensive gains, they in reality operate in and against a power system sometimes national in form but with international ramifications, and sometimes obviously international. Hence without the consciousness of this international dimension and without moves for corresponding strategy, isolated local struggles with hazy perceptions can only fizzle out, maybe after gaining some small and temporary concessions. In one context Frank and Fuentes note the global frame, including the pervasive domination of MNCs, but refuse to draw appropriate operational conclusions therefrom.

Although Frank and Fuentes more than once note the "uncontrollable forces of national and world economy" and the characteristic feature of the contemporary situation in which "not even national states have sufficient power", as well as the impact of the global economic crisis on local struggles they seek to offer no strategic or tactical perspectives in facing these problems. More significantly, although they occasionally mention the emergence of MNCs as global factors, they do not draw out the crucial significance of their emergence. Further, they either keep silent or belittle the role of the working class as the pivot of a global front against the MNCs within each nation and on the international scale.[27]

Another prominent social thinker who has been active in promoting the self-activation of civil society in india, Rajni Kothari, goes much further than Frank and Fuentes in depicting the present world process, particularly as manifested in developing countries such as India. He also concedes *some* role to the working class and their organisations including parties, but he gives the latter only a minor role. Kothari correctly and sharply brings out the features and significance of the ongoing globalisation process when he says:

> [In] the picture of four-fold confluence - the multinationals, the corporate sector at home, foreign governments and local regimes - there entered a fifth set of actors which in the course of time took on a pivotal role in influencing policy priorities and the broad thrust of economic philosophy in a large number of developing countries. The World Bank, the International Monetary Fund, along with important UN agencies like UNDP, UNIDO, FAO, IFAD [to serve] the interests of world capitalism and transnational companies in particular.[28]

Against this pivot – of concentrated world capitalism – Kothari refuses to concede a corresponding pivotal role to its polar opposite, namely, the world working class and its agencies. About trade unions, he dismisses them almost contemptuously when he says, "As regards the trade unions, there has taken place a near collapse of them as catalysts of a working class consciousness and a working class movement". His real attitude to trade unions is reflected in the next sentence wherein he places the press and the judiciary at a higher level as he says: "Even the press and the judiciary are found to fail in their appointed tasks..." . He is of the opinion that "political parties on the one hand and trade unions on the other" have "given way before larger forces, or rather forces that are seductive and corrupting in a way".[29]

In this situation, representing sort of a 'vacuum', Kothari counts upon the NGOs (non-governmental organisations), of a particular sort of course,

> partly to revitalise the party political space, partly to correct its inadequacies but most of all to provide a constant grass roots infrastructural process . to intervene whenever necessary and above all, to permit direct involvement of the people in both non-party and party political spaces...[30]

Kothari is apparently oblivious of the fact that he is putting the cart before the horse, so to say. That is, unless the trade unions and other working class organisations, including the parties of the radical left, keep on struggling – and of coure self-critically raising the levels of their consciousness and mobilisation – there will be no climate or environment for the atomistic grass roots formations to strike their roots and sprout.

More balanced and much nearer to the correct approach is Neera Chandoke's exposition. It correctly notes that much of the contemporary discussions on civil society amounts to the effort to

> retrieve civil society as a domain of theorisation autonomous from state-centric theory [which] has led to a fetishisation of the way people struggle in distinctive ways. The opposite of homogenisation launched by the state becomes plurality, the counterposition of standardisation becomes distinctiveness and variation, the inversion of class becomes 'people' and the reverse of the macro-processes becomes micro-episodes.[31]

The author is worth quoting on a number of determinants. For instance.

> The contemporary age of politics is marked increasingly by the recognition and appreciation that politics is not shaped solely

by the social practices of classes privileged in radical discourse as actors, viz, the propertied classes and the organised working class, but by myriads of struggles over the means of production and social reproduction in people's spaces [32]

[People's struggles] have expanded the concept of democracy itself Democracy rests in social practices of people at every level of social interaction It is embedded in the efforts of people to expand areas of human rights and dignity in all spheres of life, and not merely in ritualistic and episodic participation in engagements, viz, electoral occasions. Democracy is more identified with emancipation [33] in with modes of governance [34]

The conception of power has undergone a change - ... no longer "identified with state and its functionaries, but emerges in the local contexts of concrete social interaction and in the processes of social life"

What is specific to these social movements is that they are multi class, single issue oriented and focus on local power determi- nts restricted to specific places, happenings and events and on near time goals [35]

What has been seen is the reduction of the organised industrial proletariate This has however been paralleled by the expansion of points of production, at the household, sweat shops, sub-contracting workshops, putting out work The working class has not vanished, it has been reconstituted in larger numbers, its labour is appropriated and it does not receive adequate social wages [36]

The author, however, commits a lapse of omission, but not of commission, by failing to focus on the continued key role of the working class in organised industries - the working class of the old classical conception. Though reduced in number, this segment of the working class still retains its objective position within the core of the global capitalist economy as well as its objective potentialities, born out of its existentialist characteristics as well as its inheritance of historical experience of class struggle With the growing crisis of the capitalist world economy and the consequent breakdown of the post second world war welfare build-up in the developed capitalist countries, this historical working class is steadily reviving today its militant confrontation with the hard core of the world capitalist order This is the fundamental reference point to all struggles for people's rights and livelihood all over the world. The future of people's actions in any part of the world rests in the final analysis on the two-fold base. (1) development of working class action in the core sector of capitalism, and (2) linkage of the relatively peripheral struggles to the struggles in the core sector.

People's action and the problematique of civil society can be fruitfully viewed only in this defined context

Agrarian Changes, Unfreedom and Attached Labour

Surinder S Jodhka

IN his comment on my paper [Jodhka 1994] Brass (1995) has tried to contest my argument by claiming that not only are there no 'counter-tendencies' leading to a decline in the incidence of attached labour or in the elements of unfreedom in labour relations, but, restating his earlier position, that the trend in Haryana agriculture is an opposite one. Using the mechanism of debt, Brass argues, farmers control and discipline agricultural labour. This leads to 'decomposition/recomposition' or 'deproletarianisation' of labour. Hence for Brass, indebted labourers, both permanent as well as casual, are like unfree slaves and the incidence of unfreedom is growing with capitalist development in Haryana agriculture.

While apparently trying to counter my formulation, the actual scope of his comment goes much beyond what I have tried to argue in the article. My paper deals exclusively with the issue of emerging patterns in the system of attached labour (i e, permanent labourers working with a specific farmer on annual contract basis) in Haryana agriculture. Though much of the field data[1] used in the paper has been taken from the data collected for a broader project on changing debt relations in Haryana agriculture which I submitted as a PhD thesis in 1990 [Jodhka 1990], the formulations and arguments presented in the paper, particularly my disagreements with Brass, were developed to a large extent later in response to an article that Brass wrote and published after I had submitted my thesis and to several other books and papers that came out thereafter.

However, it is surprising that Brass in his response has commented more on my unpublished tentative formulations presented in the thesis than on the paper in which I engage with his position (references to my PhD thesis appears 16 times in his comment and to my article only 12 times). My objection is not to the reference to my PhD thesis as such, but to the fact that Brass refuses to read my article independently of my PhD thesis and to the way in which he picks up statements from the thesis and clubs them with those from the paper in order to prove his point. In a rather unfair way, he even goes to the extent to trying to find contradictions in my argument presented in the paper by picking up statements from the unpublished thesis [see Brass 1995: notes 3, 4, 7 and 8].

I am also surprised that even where I have no disagreements with his position, Brass tries to project that I have a completely opposite point of view and attributes to me those positions that I criticise in my paper. For example, on the question of characterisation of attached labour in Haryana agriculture, in many ways I have tried to substantiate Brass's position by arguing that they are "the most deprived category in the agrarian society of Haryana today" and that the elements of unfreedom are very obviously present in the relationship. I also do not have much problem in accepting his definition of unfreedom. As he argues, and I agree, attached labour is an unfree relationship in the sense that though a labourer willingly offers himself for work it does not follow that the production relations will be correspondingly free in terms of the worker's capacity to re-enter the labour market" [Brass 1990:55, note 2].

However, I disagree with Brass when he claims that not only is attached labour an unfree relationship, but also that the incidence of unfreedom is growing – what he describes as a process of deproletarianisation. I also hesitate to conceptualise present-day attached labour and other forms of labour-tying arrangements that are mediated through debt as 'debt bondage' or 'debt slavery' (or accept that it is growing). I prefer to call it 'labour mortgage system'.

And I have very clearly spelled out what I mean by it. Above all, in this framework, accepting attached labour would imply giving up or surrendering one's freedom. It also suggests compulsions arising out of a weak economic position. My respondents had to choose this 'unfree relation' when they needed a comparatively large amount of money. Such situations arose generally when there was a wedding in the family or the house had to be renovated or at the time of a major illness in the family. And in such situations they had to forgo their freedom because they did not have any other assets. And hence 'the labour mortgage'. This is an instrumental decision in the sense that the labourers are aware of the bargain, dislike the arrangement, but have no other choice. And they try to come out of it as soon as they can.

Brass finds this formulation "curious and contradictory" and insists on describing it as "a form of subsistence guarantee" [Brass 1995:697], which for Brass operates within the system of "patron-clientage" and provides "its subjects with economic security" [Brass 1990:37].

One of the main reasons for a decline in the system of attached labour that I identified in my paper was a near complete erosion of the ideology of patronage and loyalty. Moreover, hardly any of my respondents saw attached labour positively or as a source of economic security. Nor have I said it was so in my paper. They chose attached labour not because of regular subsistence requirements but clearly because of contingent needs. And it is precisely in the absence of 'patron-clientage' ideology that it becomes a system of labour mortgage (compulsive and negatively viewed) and not a system of subsistence security (desirable and positively viewed).

The more contentious issue for Brass is my assertion that though attached labour is an unfree relation, there are also 'counter-tendencies' leading to a gradual decline in the system of permanent labour relations. The three main factors responsible for this trend that I have identified in the paper are (i) the growing dislike of the "loss of freedom" involved in working as an attached labourer; (ii) changing power equations at local and regional level along with a near complete erosion of the ideology of patronage and loyalty, (iii) growing linkages with the urban market, opening-up alternative sources of employment to the workers.

Notwithstanding his own contention that the agrarian capitalists in Haryana are indeed preferring "casual instead of permanent workers" [Brass 1995: 697], he finds my claim about a trend towards decline in attached labour "as an optimistic (and premature) view" [Brass 1995:697]. For Brass, the shift towards casual labour has been engineered by the capitalist farmers who continue to maintain, or even tighten, control over these labourers through the mechanism of debt and find it comparatively cheaper. Thus, substantively, not only is there no change in the phenomenon of 'attachment' or 'unfreedom', but there is in fact an opposite trend leading to deproletarianisation.

I strongly disagree with Brass here because for me this shift is not a result of changing labour needs of the capitalist farmers, but a consequence of growing assertiveness among the workers and a weakening of the hold of the farmers over the labourers – both politically as well as ideologically. In fact there was a general scarcity of those willing to work as permanent labourers.

Brass also finds my claim about a trend towards a decline in the incidence of attached labour not substantiated with any quantitative evidence and accuses me of basing my opinion exclusively on information supplied to me by the employer farmers and which should therefore be treated with "extreme caution and scepticism" [Brass 1995: note 5]. This is rather curious. I have very explicitly stated that the paper is largely based on the 75 case studies of agricultural labourers, permanent

as well as casual [Jodhka 1994:A103]. I also interviewed 110 farmers of whom 29 were big farmers who regularly employed permanent labourers. However, Brass chooses to ignore this and attributes my claim to the opinions of the big farmers alone. Moreover, I am not the first person to report a decline in the incidence of attached labour in Indian agriculture. Even in the case of Haryana, Shiela Bhalla has been stated to have made a similar observation [see Chaudhary 1993:A-148, note 88].

This, however, may not be significant for Brass because he also argues that "the structure of debt and bondage in Haryana has shifted from permanent to casual labour" [Brass 1995: note 2]. For him, the process of deproletarianisation affects the casual labourers more. This claim can, however, be easily contested with the quantitative evidence that I have provided in my paper and elsewhere [see Jodhka 1990]. As reported in the paper, average standing debt of a casual labourer from informal sources was Rs 3,024, while permanent labourers had an average informal debt (largely from employer farmers) of Rs 5,786. Also it was much easier for a casual labourer to get an IRDP scheme sanctioned than it was for a permanent labourer. Out of 45 casual labourers interviewed, 31 (69 per cent) had availed of 44 IRDP schemes, while out of 30 permanent labourers, only 12 (40 per cent) had been able to get 14 schemes sanctioned. Consequently, the proportion of standing informal debt on an average for an attached labourer was 89 per cent while for a casual labourer it was 59 per cent. If debt leads to growing unfreedom (or, to put in Brass's words, 'deproletarianisation'), casualisation of labour implies an opposite trend.

In qualitative terms also labourers preferred casual labour because they say much more freedom in it. It was when they had to work as permanent labourers that they felt their freedom was being surrendered. And nowhere in my paper have I argued that attached labourers are not unfree. However, I have no evidence, quantitative or qualitative, to be able to agree with Brass that there is a process of increasing unfreedom in Haryana agriculture – either in terms of an increase in the number of those working as permanent labourers or in the form of growing unfreedom of labourers.

Also, unlike some other parts of India, the system of 'beck and call' (Thorner's expression), as claimed to be growing in Haryana by Brass, did not exist in my study villages. Though casual labourers did report that they often borrowed from the big farmers with the commitment of working for them during the peak season, this did not work as a system and unlike the 'naukar' system, it did not have a local name. Therefore, such debt obligations were of temporary nature and describing it 'bondage' would be an overstatement. Peak season work is largely done on contractual basis and most of the labourers anyway preferred working on the farm during the peak season. Apart from the better wages that they got during such times, they also looked forward to storing some grain for the household. In fact, peak season labour-tying by big farmers worked more against the smaller farmers who also needed to employ labour during the peak seasons but could not afford to pay advance wages to tie the labour. Hence they had to wait till the work got over in the bigger farms.

Farmers in my study villages did not have the kind of control that Brass seems to suggest in his formulation. Not always could they discipline their workers through the mechanism of debt. There were instances where a labourer would either run away with the debt to a nearby village or would simply stop working and refuse to pay back the debt. As reported in my paper, there were at least five such cases where a labourer was either absconding with the debt or he was staying in the village but had refused to pay back the amount [Jodhka 1994: A-105]. Such a situation generally arose when an ongoing conflict reached the stage of a scuffle or a physical fight. In a fluid and changing political context, not always could the farmers compel such estranged workers to pay back the outstanding debt. They also hesitated to report such cases to the police for fear of litigation. Once the case went to the 'labour court', farmers lost whatever chances they had of recovering the debt.

On the issue of 'changing masters' also my argument is very different from that of Brass. While for Brass, the ability of the labourers to change their masters is of no consequence, to me it seems that the new possibilities opened up by the formalised contractual arrangement in the present-day naukar system has made at least some difference. Payment in the form of an annual cash wage makes it possible to translate the annual wage into monthly or even daily wages. Such a possibility did not exist in the older 'sajhi' system where a labourer received payment for his labour in form of a share from the farm yield. Hence he had no choice of shifting over to another master till the harvesting was over. While in the present day naukar system, a labourer had to only find a new farmer who was willing to employ him with an advance to clear the debt of the previous employer.

In the context of the factional divisions among big farmers and general scarcity of those willing to work as naukars, it was not very difficult for a labourer to find another employer. There were some such cases in my study villages where labourers had actually shifted their masters before the contract year was over. Though this does not imply a complete opening up of the labour market or freedom of the attached labourers, it does point to a need to rethink the working of the system. By drawing a parallel between the possibility of changing masters in the present-day naukar system and the ability of a slave ploughman of the Mughal period to change master by borrowing from a new master in order to liquidate his obligation to the old [see Brass 1995: note 8]. Brass is only trying to suggest that over the centuries nothing substantive has changed in the social relations of production in Haryana agriculture.

The availability of alternative sources of employment, repeated experiences of participation in the electoral process of electing representatives at local, regional and national levels, growing urban contact, exposures to mass media and above all a near-complete erosion of the ideology of patronage and loyalty have led to a qualitative change in the politics of the subordinate groups in rural Haryana. The empirical instance of this new politics ranged from increasing assertiveness in everyday life (which at times led to conflicts) to the emergence of a pan-Indian dalit movement.

However, in his analysis of class struggle in Haryana agriculture, Brass not only neglects the changes taking place in the broader context of regional and national politics, but also provides no scope for an agency to the subordinate class. Even the availability of alternative sources of employment Brass seems to view from the perspective of the farmers who "might accept – and even encourage – their labourers seeking alternative employment during the off-season" [Brass 1995: 698]. The fact that additional employment would also mean

more income and consequently lesser dependence has been completely ignored by Brass. Even the migrant labourer, who for Brass is an important source of recomposition and deproletarianisation, has another dimension. The fact that such labourers generally have rural origins and are able to migrate out also points to a process of weakening of unfree relations which makes it possible for them to go out of the villages of their origin.

Though I agree with Brass that programmes like IRDP do not function independent of the agrarian class structure, I did not find the scheme being completely controlled and monitored by the big farmers. Big farmers did try to influence the bank bureaucracy against advancing IRDP loans, particularly to their attached labourers (as reported above, it was more difficult for a permanent labourer to get an IRDP scheme sanctioned than it was for a casual labourer), but it was not always that they could succeed. Factional politics in the village, competing political interests of the different sections of the dominant class, the incremental policies that they pursued to consolidate their votes among the menial castes and growing politicisation of the subordinate groups were also among the factors that influenced the working of programmes like the IRDP. It is in this complex set of processes that one has to locate the 'counter tendencies' that are weakening the power of big farmers and perhaps also leading to a limited empowerment of the subordinate groups in rural Haryana. A possible trend towards a decline in attached labour is only an aspect of this broader process.

Notes

1 I also visited my field villages again in May 1992 for two weeks.

2 I am grateful to D N Reddy for pointing this out.

Industrial Growth and Stagnation

Edited by

Deepak Nayyar

A selection of essays presenting the main strands in the debate on industrialisation in India. The contributors analyse the factors underlying the deceleration in industrial growth from the mid-1960s to the mid-1970s and discuss the conditions and policies for a return to the path of sustained growth. Alternative hypotheses about the macroeconomic determinants of and constraints on industrial growth in India are examined, focusing on the performance of the agricultural sector, intersectoral terms of trade between agriculture and industry, disproportionalities within and between sectors, the level of investment in the economy, the nexus between public and private investment and the relative significance of supply and demand constraints.

Poverty and Income Distribution

Edited by

K S Krishnaswamy

While there has been, over the years, a perceptible increase in per capita income and expenditure and possibly some decline in the incidence of poverty in India, what still remains is massive and of a kind that is not remedied quickly or smoothly. Even with radical policies, the shifts in income and occupational structures to make a serious dent on it will take more than the rest of this century. In the welter of recent exchanges between the government and the opposition as well as between planners and market advocates on the strategy of growth, these issues have been largely obfuscated. It is therefore more than ever necessary today to recognise the magnitude of the problem and the inadequacy of the measures adopted so far to deal with it.

AMERICAN EXPRESS BANK LIMITED

(INCORPORATED IN THE U.S.A. WITH LIMITED LIABILITY)

INDIAN BRANCHES

SCHEDULE 17—NOTES TO ACCOUNTS

1. PRINCIPAL ACCOUNTING POLICIES

1.1 General

The accompanying financial statements have been prepared according to the historical cost convention, except premises of the bank which have been stated at revalued amounts. They conform to generally accepted accounting principles and to the practices prevailing within the banking industry in India.

1.2 Foreign Currency

a) Assets and liabilities in foreign currencies, except deposits from Non-Residents held under Foreign Currency Non Resident (A) and (Banks) schemes, are translated into Indian Rupees at the rates notified by FEDAI as at the balance sheet date. Resultant gains or losses are taken to the profit and loss account. Transactions during the year are converted into Indian Rupees at the rates current on the date of the transaction. The balances held under Foreign Currency Non Resident (A) Deposits scheme are valued at the rates specified by the Reserve Bank of India from time to time, whereas, balances held under Foreign Currency Non Resident (Banks) Deposits scheme are stated at the rates at which they were originally sold, with the costs of forward exchange cover for such deposits being spread over the period of the contracts.

b) Contingent liabilities in respect of Forward Contracts are included at contracted rates.

c) Outstanding Forward Exchange Contracts are revalued at the rates notified by FEDAI as at the balance sheet date in order to account for the financial effect thereof.

1.3 Investments

a) Investments in Approved Securities:

i. Permanent Investments

These are valued at the cost of acquisition, adjusted for the premium on acquisition. Premium on acquisition is amortised over the residual period to its maturity.

ii. Current Investments

These are valued at the lower of cost of acquisition and market value. Treasury bills and Zero Coupon Bonds are valued at carrying cost which includes discount accrued over the residual period to its maturity.

b) Other Investments

These are valued at lower of cost and market value. Commercial Paper is valued at carrying cost which includes discount accrued over the residual period to its maturity.

c) Market Value

The Market value in case of securities for which quotes are not available has been determined on the Yield To Maturity(YTM) method in accordance with the yield pattern determined by the Reserve Bank of India. Provision for diminution in value of investments is ascertained on an aggregate basis for each category of Investment.

1.4 Fixed Assets

All fixed assets except premises are stated at historical cost less accumulated depreciation. Premises, have been revalued on 31st March, 1993, and are stated at the values as determined by the firm of valuers, less accumulated depreciation. The surplus arising on revaluation has been credited to Property Revaluation Reserve Account.

1.5 Depreciation

Depreciation on the fixed assets of the Bank is provided on the straight line method and on those of Travel Related Services (TRS) division, on the written down value method. The rates of depreciation are as prescribed by Schedule XIV to the Companies Act, 1956, except for Furniture & Fixtures in the case of the bank, and Improvements to Premises in general, where higher rates have been adopted in accordance with their useful economic lives. Depreciation on revalued assets is provided for on the revalued amounts and charged to profit and loss account.

1.6 Advances

Advances are stated net of loan loss provisions in respect of identified advances and provision for doubtful interest. Provision for loan losses is made in respect of identified advances based on a periodic review as per the Bank's policy which also satisfies the provisioning guidelines issued by the Reserve Bank of India.

1.7 Income Recognition

Interest income is recognised on an accrual basis except in case of non-performing advances, where it is taken to Profit and Loss Account on realisation.

1.8 Staff Benefits

Provisions for gratuity and pension benefits to staff have been made on the basis of actuarial assessments.

1.9 Provision for Taxation

Provision for taxation has been made based on the 'liability method' of accounting which is generally followed in India.

1.10 Net Profit

The net profit disclosed in the Profit and Loss Account is after:-

a) the effect of revaluation of "investments" (see paragraph 1.3 above)

b) provisions for loan losses (see paragraph 1.6 above).

c) provision for taxes on income in accordance with statutory requirements.

d) other usual and necessary provisions.

AMERICAN EXPRESS BANK LIMITED

(INCORPORATED IN THE U.S.A. WITH LIMITED LIABILITY)

INDIAN BRANCHES

2. In accordance with the instructions received from the Reserve Bank of India, the assets and liabilities related to, and as appearing in the books of, the Travel Related Services Division, after adjusting the loss for the year, have been shown under "Other Assets" and "Other Liabilities".
3. During the year, the Bank has changed the policy relating to valuation of permanent investments. Discount on acquisition of permanent securities, which was accrued over the residual period to maturity up to the previous year has not been accrued during the year as per the guidelines of the Reserve Bank of India. As a result of this change the profits are lower by Rs. 44,700 thousand.
4. Demands to the extent of Rs. 1,168,094 thousand, raised by the Income tax authorities in respect of Assessment years 1990-91 to 1992-93, have not been provided in these accounts since these are being contested in appeal and the bank is confident of the appeals being decided in its favour.
5. All balances with other overseas branches of the Bank and the Head Office have been grouped in the appropriate heads of account.
6. Figures for the previous year have been regrouped and reclassified wherever necessary.

AUDITORS' REPORT ON THE ACCOUNTS OF THE INDIAN BRANCHES OF AMERICAN EXPRESS BANK LIMITED UNDER SECTION 30 OF THE BANKING REGULATION ACT, 1949

We have audited the attached Balance Sheet of the Indian Branches of American Express Bank Ltd. (Incorporated in the U.S.A. with limited liability) as at 31st March, 1995 and the related Profit and Loss Account for the year ended on that date annexed thereto, in which are incorporated the transactions of the Office of the Chief Executive Officer and the transactions of Travel Related Services Division in India.

The Balance Sheet and Profit and Loss Account have been drawn up in accordance with the provisions of Section 29 of the Banking Regulation Act, 1949, read with the provisions of Section 211 and Section 227 of the Companies Act, 1956

We report that:

1) We have obtained all the information and explanations which to the best of our knowledge and belief were necessary for the purposes of our audit and have found them to be satisfactory.

2) The transactions which have come to our notice have been, in our opinion, within the powers of the Indian Branches of the Bank.

3) In our opinion, proper books of account as required by law, have been kept by the Indian Branches of the Bank so far as appears from our examination of these books.

4) The abovementioned Balance Sheet and Profit and Loss Account of the Indian Branches of the Bank dealt with by this report are in agreement with the books of account.

5) In our opinion and to the best of our information and according to the explanations given to us, the accounts together with the notes thereon, give the information required by the Companies Act, 1956, in the manner so required for Banking Companies, and on such basis, the Balance Sheet gives a true and fair view of the state of affairs of the Indian Branches of the Bank as at March 31, 1995 and the Profit and Loss Account gives a true and fair view of the profit of the Indian Branches of the Bank for the year ended on that date.

Bombay
Dated: 4th August, 1995

Rajiv, a valued customer, has discovered the advantage of getting his Home Loan sanctioned before he started his search for a house. Because the moment he found a house that met his approval, the money was ready and waiting! No delay. No worries about someone else cornering the house as he got the money together.

Rajiv not only saved himself from needless anxiety, but also valuable time and money. HDFC sanctioned his loan, based on his repaying capacity and scrutiny of basic documents. Soon after he found his house, HDFC was able to disburse the loan quickly as the loan had already been sanctioned.

Rajiv took a loan of Rs. 1,50,000 repayable over 15 years and his monthly instalment was Rs.2,190, which he was able to calculate from the tables given here.

"Getting my loan sanctioned from HDFC even before I found a flat, saved me a big headache."

H·D·F·C

HOUSING DEVELOPMENT FINANCE CORPORATION LIMITED

Regd. Office: Bombay.

Loan Amount (Rs.)	Rate of Interest (% per annum)
0 - 25,000	12.00
25,001-1,00,000	15.00
Above 1,00,000	15.50

EMI (Monthly Instalment) for loan of Rs.10,000			
Term of loan	% per annum		
(Yrs)	12 00	15 00	15 50
5	232	249	252
10	148	167	170
15	123	143	146

All Rajiv had to do to get his loan sanctioned was, fill in the **Free 'Home Loan Application Form.** And submit his passport size photograph, a cheque for the processing fee and his latest salary slip. If he was self employed, and not a salaried employee, he would have needed his computation of income. (Profit & Loss Account and Balance Sheet, for the last 3 years).

The name plate on his door today, declares his wise decision.

Now, all you have to do is contact us. We are at your service.

FISCAL DEFICIT: RETURN TO ORIGINAL SIN

IDBI ASSURANCE. ANYWAY YOU LOOK AT IT!

Every month.
Every quarter.
All at the beginning.
All at maturity.

YOUR FOUR-WAY OPTION WITH IDBI'S FIXED DEPOSIT SCHEME*

TYPE	MINIMUM DEPOSIT	YIELD STRUCTURE
Monthly Income Option	Rs.18,000	Rs.195 every month on a 5 year deposit of Rs.18,000.
Quarterly Income Option	Rs.10,000	Rs.325 every quarter on a 5 year deposit of Rs.10,000.
Lumpsum Discounted Interest	Rs.10,000	You will get Rs.4,572 immediately on a 5 year deposit of Rs.10,000.
Cumulative Option	Rs.10,000	A Rs.10,000 deposit becomes Rs.18,958 in 5 years.

** Interest upto Rs.13,000 on the above deposits is tax-exempt under Section 80L of the Income Tax Act, 1961*

MINIMUM DEPOSIT: Rs.10,000

Beyond the minimum amount, you can deposit in multiples of Rs.1,000. The base interest rate for a three year deposit is 12.5%. And a deposit period of five years and more fetches a base rate of 13%. What's more this deposit comes with the guarantee of India's premier development bank - IDBI. Reflected in the FAAA rating by CRISIL given to this product indicating the highest degree of safety. Naturally, an organisation that has total assets of over Rs.36,000 crores can take very good care of your investment. For more details contact your nearest IDBI office or any authorised IDBI agent.

Colonialism and Environment

Although colonial rule throughout the world was accompanied and supported by exploitation of forests and environmental destruction, independence has not put a stop anywhere to these processes. Rather, the disruption of the relationship between local societies and their natural resource bases has continued. But instead of contrasting this situation with a mythical golden age of equilibrium between society and nature, what is needed is a radical critique, with regard to this aspect, of capitalist expansionism of which colonisation of nature on a world scale has been one of the major objectives. **2059**

Missing Females

The problem of the adverse sex ratio in India calls for disaggregated analysis. The absence of such analysis masks the seriousness of the situation among certain groups and in certain areas. Data on the male/female ratio for scheduled castes and scheduled tribes bring out some major problem areas **2074**

Life after Enron

The Enron fiasco has brought out the pitfalls in the current path of power development in the country. The high rates of return, the incentive to inflate project costs and the use of imported fuels are all common to most of the power projects being considered with private investment. If the current policies are not viable, what should be the core of the alternative ones? And what should be the regulatory regime that needs to be put in place? **2042**

The terms of the eight so-called 'fast track' agreements for power projects with multinational companies, of which Enron was one, are undoubtedly ruinous for the concerned state governments and for power consumers. But the danger of focusing on these specific projects is that attention is likely to be diverted from the more fundamental task of framing a new policy for the power sector based on a correct understanding of the dimensions of the crisis facing the sector and how it can be resolved. **2038**

State under Siege

The current phase of capitalism is marked by the rise to dominance of financial and rentier interests and the fluidity of finance across national boundaries. This has the effect of undermining the 'control area' of nation-states, of making all agendas of state intervention for improving the living conditions of the people appear vacuous, of precipitating stagnation and unemployment even in the metropolitan countries and of prising open third world economies for penetration not only of metropolitan goods but, more importantly, of metropolitan finance. **2049**

V M Dandekar

While insisting on and himself maintaining rigorous academic standards, V M Dandekar's writings reflected the activist side of him — his view that knowledge was not merely a matter of scholarship but was meant to be used to educate and to clarify issues to the public at large to facilitate better-informed debate and decision-making. **2044**

Demand Constraint

Exploration of the extent to which demand side factors have served as a constraint on industrial growth has become all the more relevant in the context of the government's structural adjustment programme and policies of liberalisation and privatisation. **2070**

Back to Square One

The phenomenal rise in the government's borrowing from the Reserve Bank together with some easing of the demand or commercial credit, reflecting a possible slow-down of industrial investment and production, have eased the severe shortage of liquidity experienced in the money market in the first quarter of this financial year. **2031**

Holocaust Remembered

The commemoration of the 50th anniversary of the end of the second world war and the dawn of the nuclear era makes clear that neither the leaders nor public opinion in the US and Japan have yet come to terms with the moral-political issues posed by the holocaust **2047**

LETTERS TO EDITOR

Remembering V M Dandekar

V M DANDEKAR who symbolised the spirit of Gokhale Institute of Politics and Economics for an extended period of time is no more The roaring lion has dissolved into cosmos

I would like to share my reminiscences of Dandekar with our readers. As a UGC Teacher Fellow for four years (1978-82) at Gokhale Institute, I had the pleasant privilege of watching the dynamic professor in action.

He was an excellent teacher, a serious researcher and a good debater. He evoked respect and affection from his colleagues and students by his intellectual standing and simple living. His lifestyle and work culture are worth emulating by any academician.

Although he is quoted and remembered for his pioneering work, *Poverty in India*, carried out in collaboration with Nilakanta Rath, his seminal papers on diverse themes pertaining to the Indian economy in *Economic and Political Weekly* would bear testimony to his academic scholarship and professional commitment to society. He had basic love, respect and concern for fellow human beings

Once a Pune-based gentleman working in the IMF came from the US to deliver a five-day lecture series on the IMF at the Gokhale Institute (August 1978). In the inaugural session, after patiently hearing him for half an hour, Dandekar intervened and asked the chief guest to go into analytical details instead of telling the story. He could not tolerate shallow speeches by anyone.

His M Phil class lectures on Karl Marx and Sraffa (our first M Phil set of 1978-79) provided him the solid foundation to challenge Gautam Mathur who inadvertently or deliberately made a statement that Dandekar was a statistician in the Indian Economic Association conference held at our institute in the early 1980s. Offended by this unwarranted statement, the lion called for a debate on the very same day to discuss Sraffa's system and demonstrated that he was a good theoretician as well

His emotional side came to the fore in a farewell party arranged for Niranjan Rao (now a professor at Centre for Development Studies, Trivandrum). In a choked voice he said that he was too eager to retain Rao and would not let him go but he did not want to stand in the way of his going for greener pasture and academic growth.

Dandekar was a multidimensional personality and age did not wither him. His analytical articles written in *EPW*, with profound clarity and a sense of commitment, would be a treasure for any serious student of economics. His papers such as 'Monetary Planning for Indian Authority' and 'The Economy and the Budget' reveal what a keen economics student Dandekar always was.

D SAMBANDHAN

Pondicherry

False Dichotomy

THIS is with reference to K Satyanarayana's 'Rhetoric of Neo-liberalism' (May 24) in which he has made some contentious and unsubstantiated generalisations about the personality and personal integrity of K Balagopal as well as the civil liberties movement which are both unnecessary and irrelevant and do not contribute in any way to the ongoing debate.

(1) The dichotomous separation of Balagopal as a civil liberties activist and Balagopal as a marxist seems to be crude and personalised, especially when one notices that Satyanarayana does not offer any supporting statements by Balagopal proclaiming himself to be a 'marxist' The suggestion that Balagopal "has chosen to work in a civil rights organisation for strategic reasons" also seems to have sprung from the author's imagination rather than any evidence On the contrary, Balagopal is known for his continuous efforts to separate the civil liberties movement in Andhra from other mass movements and to maintain the autonomy of the civil liberties movement at any cost.

(2) Secondly, the author's accusation that Balagopal deliberately avoided mentioning anti-state struggles because he had ceased to be a marxist does not go with the Balagopal known in Andhra Pradesh who still ceaselessly works for civil liberties and who still uses categories such as state, class, gender and so on

(3) Thirdly, by equating civil liberties/human rights with liberalism and posing the civil liberties perspective as dichotomous and the opposite of marxist political practice the author proposes a very rigid reading of the 'marxist politics' which lacks the essence of marxist methodology, i e, dialectics. The insistence on anti-state struggles without the simultaneous expansion of the rights already vested in the state seems to be the essence of marxist political practice, according to the author This confusion leads to the conflation of human rights with civil rights as well as human rights with 'liberalism' which shows the author's lack of knowledge of the history of the development of human rights movement(s) as well as ignorance of the history of the civil liberties movement in his home state

So Many Dabhols

SO the heavens did not fall after all. The cancellation of Enron's Dabhol power project by the Maharashtra government has not reduced the country to rack and ruin, as some very eminent personages had been assuring us it would. Indeed what is remarkable is that those who just weeks ago were hurling dire threats on behalf of Enron that any untoward action against its project would be regarded as quite intolerable and would result in nothing less than total loss of foreign investors' confidence in India appear to have suddenly mellowed and are now straining hard to sound reasonable and understanding. Take, for instance, the US energy secretary who on lobbying visits to this country earlier this year had read us the riot law and told us in no uncertain terms that cancellation of the Enron project would jeopardise all the private power projects being proposed for international financing. Her brashness had been such as to cause some raising of eyebrows even in the US Congress but our own ministers took her statements with the utmost earnestness. Now the redoubtable Hazel O'Leary is singing a different tune, however. Her response to the Maharashtra government's decision on Enron has been notably moderate. She has merely asked that India's policies in respect of the power sector be more clearly spelt out. And in place of the earlier bluster, she is all concern for the long-run relationship between India and the US and is at pains to emphasise that "rough patches" such as the Enron episode "cannot be allowed to get in the way". Or take the Independent Power Producers' Association which too had campaigned aggressively on behalf of Enron, but faced with the Maharashtra government's decision it has likewise confined itself to calling for a national dialogue on energy policy to evolve clear-cut guidelines to attract foreign investors. Who can possibly disagree with that?

No, not one of the companies, foreign and Indian, which have rushed with the 190 or so proposals for private power projects, including the other seven 'fast-track' projects, have given the least indication of entertaining any second thoughts in the light of the Enron project's fate. Their uppermost concern is clearly to avoid similar criticism and review of their own projects and towards that end they are exhibiting a hitherto unsuspected readiness to consider modifications, cosmetic or otherwise, in the agreements already concluded or under discussion. There is really nothing surprising about this. The established capacity in the developed countries for manufacture of power generation plants is currently far in excess of the demand and India is very much in a buyers' market. So one may be quite certain that none of the power multinationals with any chance of bagging a power project or two here will be in a hurry to walk away in a huff. It is a different story that thanks to the central government's slavish conviction that the country's salvation lies in gratefully accepting whatever foreign investment comes its way, on whatever terms, this advantage has remained unexploited.

Despite the secrecy surrounding the terms on which the agreements for the other 'fast-track' power projects have been concluded, it is evident that they are not particularly less unfavourable than those of Enron's Dabhol project. Nor is the disease apparently confined to the power sector. A striking case is the agreement the government has got the ONGC to enter into for handing over the Mukta/Panna offshore oilfields to a joint venture company in which the same Enron and Reliance Industries will together have majority equity holding with only a 40 per cent share for ONGC. The oil reserves in question had been explored and proven by the ONGC and there was no case for transferring them at this stage to a private company. The terms of the deal, wholly arbitrary in the absence of any clearly laid down policy or norms, had to be forced out of the government by the opposition in parliament. They reveal that as per the formulae for recovery of costs and sharing of profits, while the costs to be incurred by Enron in production of oil from the fully proven fields will be recovered by the company through the mechanism of 'cost oil', the ONGC is to get no compensation for the exploration and development costs incurred by it, including the costs of drilling a number of development wells and installing other facilities even after the conclusion of the agreement for creation of the new company. These wells and facilities are simply *assumed* to have been commissioned and installed by the ONGC before the date of the agreement. The agreement also explicitly leaves to Enron vital decisions about exploitation of the country's oil and related resources; the foreign company is to decide when commercial production is to commence and whether or not associated gas is to be recovered or flared. No less shocking are the terms on which the minister of state for steel has coerced another public sector enterprise, the National Mineral Development Corporation (NMDC), to hand over its prized Bailadilla iron ore mine to an Indian business group through a so-called joint venture in which the NMDC's equity participation is to be just 11 per cent. To justify the decision to transfer the mine for a paltry consideration of Rs 16 crore, against the commercial consideration of at least Rs 120 crore as reportedly calculated by experts, the ministry has advanced the brazen plea that the transfer should not be viewed as a "normal commercial transaction" but should be seen "in the larger perspective of the urgent need to promote iron and steel projects in the private sector".

The rent element in these deals as in the agreements for the 'fast-track' power projects is so blatant that corruption and bribery are to be expected, indeed to be taken for granted. Even so corruption is not the heart of the matter, though it has figured prominently in the public controversy surrounding each of the deals. The central fact must not be allowed to be lost sight of that the ultimate blame must rest on the architects of the current economic policies which have elevated foreign investment and privatisation to the status of national goals with the result that today no deal is so outrageous that it cannot be justified on those grounds and pushed through. And the well-grounded apprehension that these good times may not last longer than a few months more will no doubt prompt the Salves and the Santosh Mohan Devs to redouble their efforts.

MEDICAL EDUCATION

Wrong Subsidy

IN an interim decision the Supreme Court has directed the government of India and the Reserve Bank of India to subsidise medical and dental education by providing an amount of Rs 5,000 per annum to all students admitted to private medical colleges, regardless of whether the student is admitted under the 'free-merit' or 'payment' category. The government has been directed to provide a subvention for that amount for a period of five years or until the student completes the course whichever is earlier, which shall be sent directly to the concerned college towards fee every year. This is an interim directive to be effective immediately, pending the final disposal of the case with regard to fee structure, etc. The court has also directed the RBI and the centre to evolve a loan scheme for providing low interest loans to medical and dental students on a priority basis. Till the scheme is worked out, the court has taken it upon itself to direct the RBI to provide a loan of Rs 15,000 for 'free-merit' students and Rs 50,000 for payment students at a differential rate of interest.

The directives raise several serious issues, at least one of which was touched upon by the solicitor-general. Opposing the court's directive on the issue of the government providing a subsidy, the centre's counsel pointed out that this would involve a payment of millions of rupees annually to private medical colleges and went against the centre's education policy, one component of which was the acknowledgment of the need for private resources to supplement the state's efforts in education. Further, the centre had not been issued notice or been heard on the subject. According to reports, the court merely pointed out that this was an interim directive and the government could put its case forward later when the case would be heard by a seven-judge bench for final disposal. The fact that even if the directive was withdrawn later, the government would be bound to pay out the amounts as directed by the Supreme Court to students commencing their medical studies this year for the full five years was apparently ignored. While issuing their directive, the judges said, "we need not emphasise the fundamental significance of investment in education. It is, therefore, time that the government and public financial institutions involve themselves more actively in promoting education".

It is indeed commendable that the apex court has deemed it necessary to remind the government of its duties in promoting education and investing in it. However, it appears to have overlooked the fact that such investment if it is to be of long-term significance to the development of human resources of the country, has to be directed at strengthening the base of education and not at subsidising the 'cream'. For, it is an incontrovertible fact that only a minuscule proportion of those who enter high school complete the course and of the few who continue their education up to the higher secondary level only half pass out and of these only very few can think of applying for a five-year professional course. In other words, the state is already ensuring, directly and indirectly, that only a small proportion of its youth will be able to take advantage of the educational facilities it has promoted. The court's reminder to the government together with its directive only emphasise that the state's priorities were indeed correct. Thus the entire question of fee subsidies and soft loans can only be discussed in the rarefied context of the very few who have come to regard higher education as a right.

Within these narrow confines, professional education and especially medical and dental education have been the subject of considerable debate over the decades. In the 1950s, when the concept of planning for the country's development and therefore of harnessing all its resources, including human resources, towards that goal was a dominant paradigm, targets were laid down for the creation of medical personnel.

By the time the Sixth Plan document was being drafted, it was clear that the number of medical seats available in the country would provide sufficient doctors to make up the specified ratios. And so the document recommended that there should be no more medical colleges. While in the present ethos, which sees the state's directives on any matter of investment as a curtailment of entrepreneurial freedom, this may sound old-fashioned, there were sound reasons for the position taken in the Sixth Plan. Most importantly, for the pattern of diseases predominant in the country at that time and even now, doctors trained at high cost to the state were not deemed necessary. The assumption was that most of the medicare needs of the population could be provided by health functionaries, far less expensively trained. However, the planners had all along ignored the burgeoning private medicare structures and the steady stream of medical migration. This plus a variety of other factors ensured that the public health sector remained under-staffed while the private sector and the call of the west drew away the medical graduates being produced by the state at great expense. The medical profession thus became a profession of choice, it combined the ethos of philanthropy with the excellent returns of private practice. The opening of private medical colleges became inevitable, as also the charging of capitation fees and/or high tuition fees so that medical practice and medical education became part of a growing medical industry. Not surprisingly, the content of medical education remained geared to tertiary level and hi-tech care and, with no real authority to enforce regulations, quality fell by the wayside. All this the state, its institutions and allied bodies which are charged with the responsibility of ensuring the quality and content of medical education have allowed to happen. If now the apex court, falling in with the current ethos of viewing medical education merely as a means to obtain the wherewithal to practise one of the most lucrative professions in the world, sends out a directive to the government to actually subsidise those who opt for such education, the state has only itself to blame. Or rather, the state is now in the happy position of not taking a politically incorrect decision - to subsidise professional education - and yet being compelled to do so by a directive of the apex court.

By leaving out such factors as the nature and quality of education provided in the medical colleges for which the fee structure is being prescribed, the Supreme Court has firmly and formally shifted the spotlight to those who benefit from the expensive subsidy rather than the relevance or otherwise of the content of that education.

GOLD IMPORT

Drain of Saving

DATA compiled by the World Gold Council, an organisation dedicated to promoting the use of gold the world over that has opened an office in Bombay recently, confirm that India continued to be the world's largest consumer of gold in the first half of 1995. India had topped the list of gold-consuming countries in 1994 with a consumption of 415 tonnes, followed by the US with 283

tonnes, Japan 228 tonnes, China 224 tonnes and Saudi Arabia 174 tonnes. Thus India's consumption of gold was almost 50 per cent more than that of the US, the second largest consumer.

In the first half of 1995 the US was replaced by Japan in the second position, though the Japanese economy has been in the throes of one of its worst recessions in recent decades. This is not altogether inexplicable, for Japan has one of the highest saving rates in the world, with gross saving of 34 to 35 per cent of GDP during 1990-93 and around 32 per cent in 1994. Japan's domestic savings exceed investment needs. Households in Japan thus have large accummulated assets and, in the wake of the financial market turbulence and loss of bond and equity values, their asset preference seems to have shifted from financial assets to gold.

Demand for gold in India in the first half of 1995 was 235.1 tonnes compared to 193.9 tonnes in the first half of 1994, an increase of 21.2 per cent. Japanese demand for gold in the first six months of 1995 was way behind at 164 tonnes followed by the US with 139 tonnes, China 119 tonnes and Saudi Arabia 99 tonnes.

There can be no doubt that the government's policy of permitting legal import of gold has stimulated consumption of gold. Demand for gold – met by (i) legal and illegal imports, (ii) unrecorded jewellery imports, and (iii) recycling – is estimated to have shot up from 240 tonnes in 1990 and 260 tonnes in 1991 to 454 tonnes in 1992 when the government first permitted legal import of gold by NRIs. After that quantum leap, demand has remained high at 424 tonnes in 1993 and 415 tonnes in 1994.

Scarcely any gold is produced in India with barely a tonne or two trickling out of the Kolar mines per year. So the growing demand for gold has to be met entirely by imports. Legal imports have risen from 95.3 tonnes in 1992 to 114 tonnes in 1993 and 178.4 tonnes in 1994. There was a further sharp rise in the first half of 1995, by 54.3 per cent from 81.7 tonnes in January-June 1994 to 126.1 tonnes. It is true that smuggling of gold has declined from the peak level of 225 tonnes in 1992 to 150 tonnes in 1993 and about 105 tonnes in 1994. But the distinction between legal import and smuggling is relevant only up to a point, for much of the legal import is reportedly financed by smugglers. It is the total import of gold that is significant and it shot up from 150 tonnes in 1991 to 320 tonnes in 1992, the year when legal imports were first permitted, and has continued at the high levels of 264 tonnes in 1993 and 283 tonnes in 1994 (excluding import under export schemes). It is also significant that, despite the government's policy of permitting import legally, over 100 tonnes of gold continue to be smuggled into the country annually.

When legal import of gold was permitted in 1992, the government had claimed that the objective of the new policy was, apart from earning some revenue by way of the customs duty on legally imported gold, to reduce illegal transactions in foreign exchange and thereby curb the 'havala' market. The duty on gold import has been drastically reduced because of pressure from the smugglers' lobby. As a result, revenue collection, in the range of Rs 250 to Rs 300 crore annually, has been a pittance. In fact sale of confiscated gold and silver yielded the government Rs 200 crore in 1994-95. On the other hand, the 'havala' market in foreign exchange is nowhere near being eliminated. Even now the rupee is quoted in Dubai at about 35 per US dollar against the official exchange rate of Rs 31.37.

A far more damaging effect of the liberal import of gold has been on domestic saving. Willy-nilly, the bulk of the import of the near-300 tonnes of gold annually worth some Rs 14,000 crore, which is still financed by smugglers, has to be paid for from out of domestic savings. Even the genuine NRI imports are financed by foreign exchange which would have been otherwise remitted to the country. The amount involved in the financing of the import of gold, legal and illegal, comes to about 1.5 per cent of GDP. Thus, year after year, the country has been transferring abroad domestic savings to the tune of about 1.5 per cent of GDP to satisfy the urge of the middle and richer classes to acquire gold, which has been stoked by the government's decision to allow legal import of gold.

UTTAR PRADESH

Tactical Retreat

THE grand plan of the Vishwa Hindu Parishad (VHP) to conduct a 'kalash yatra', a 'mahayagya', a 'parikrama' and a 'virat' Hindu 'sammelan' during janmashtami at Mathura has been foiled by the tough stand taken by the BSP government and the centre. The VHP had threatened to launch a stir against the state government if the latter did not allow it to carry out its programme. But the unbending attitude of the state government forced the VHP to shift the site of the yagya, scale down the kalash yatra and abandon the proposed parikrama. This is the VHP's second retreat after its decision earlier this month to give up its earlier announced programme of performing 'jalabhishek' on every Monday of the month of Shravan at the Kashi Vishwanath temple in Varanasi.

After the lifting of the ban on it, an emboldened VHP has yoked itself to the task of consolidating the Hindu vote bank for the forthcoming Lok Sabha elections. The jalabhishek programme at the Kashi Vishwanath temple in Varanasi, the Vishnu mahayagya at Krishna Janmasthan in Mathura and the proposed 'ekatmata yatras' from October are part of an orchestrated plan to bring hindutva forces to power at the centre. But given the changed political scenario in UP where the BJP is supporting a dalit-led government, VHP cannot risk damaging BJP's political calculations too much. Kashi and Mathura may be on the hidden agenda of the BJP which supports the VHP's demand for revocation of the Places of Worship (Protection) Act for maintaining the status quo on religious sites. A prominent BJP leader from Maharashtra, Pramod Mahajan, recently exhorted party members to wholeheartedly support the VHP's jalabhishek programme in Varanasi which was to start the following day. But the BJP has chosen to maintain a distinct posture from the VHP for two reasons. First, the recent court rulings and the injunctions of the Election Commission prevent it from openly espousing religious causes from its platform. Second, the party does not want to spoil the pro-dalit image it has gained by propping up the Mayavati government in UP which it thinks will pay it rich dividends in the parliamentary elections. Hence, it would defer any controversial issue from reaching a flashpoint resulting in possible dismissal of the Mayavati government or in sundering of BSP-BJP ties. Internal security minister Rajesh Pilot's visit to Mathura to beef up security measures also made the BJP worry about the gains the Congress might make from a political crisis at this stage. So the Sangh parivar had to tone down its stand and make out that the Mathura mahayagya had been planned as 'a symbolic affair' and had been "never an issue of prestige for VHP".

The BJP will nevertheless have to take stock of the effects of these developments on its support base, in UP in particular. The soft-pedalling of highly-publicised issues cannot but lead to disenchantment within the party's traditional support base and also cause tensions within the Sangh parivar. The VHP at any rate remains committed to keeping the hindutva time-bomb ticking.

Correction

In 'Current Statistics' (July 29) in the table on 'Social Indicators' (p 1895) birth, death and natural growth rates should have been expressed as 'per 000' instead of 'in 000s' and infant mortality rate as 'per 000 live births' instead of 'in 000s'. The errors are regretted.

Ed.

The annual rate of inflation touched the lowest level in 102 weeks at 7 56 per cent in the week ended July 29 The rise in net RBI credit to the centre continues, reaching Rs 21 075 crore on July 21 (compared to Rs 3,788 crore in the same period of 1994-95) Exports grew by 25 2 per cent in April-June, but a 32 6 per cent growth in imports (34 6 per cent in non-POL imports) pushed up the trade deficit to 824 million Full-year data for 1994 95 show an 8 4 per cent growth in the general index of industrial production Capital goods industries registered a robust 24 per cent rise Among individual industries metal products, electrical machinery, transport equipment and paper and paper products recorded large production increases

RELIANCE INDUSTRIES

Growth as a Habit

AN extensively diversified group with interests in fibres, polymers, chemicals and textiles, Reliance Industries is a story of integration, both backward and forward. Reliance started small with the manufacture of synthetic textiles at the Naroda plant in 1966. The first step in backward integration was yarn and fibre manufacture. This was followed by manufacture of inputs like purified terephthalic acid (PTA) and mono ethylene glycol (MEG) that go into fibre and yarn. Basic petrochemicals was the next link in the chain of backward integration. Forward integration was achieved by moving into commodity plastics like polyvinyl chloride (PVC), polypropylene and polyethylene, manufactured from the same basic petrochemicals used to make fibre and yarn intermediates

Reliance Industries closed its financial year ended March 1995 with net sales touching Rs 5,502 crore, a rise of 29 per cent over Rs 4,254 crore in the previous year. The company's other income galloped from Rs 46 crore to Rs 91 crore, a rise of 99 per cent. Post-tax profit stood at Rs 1,065 crore, a massive rise of 85 per cent, from Rs 579 crore in the previous year. The net profit was on a net worth of Rs 7,192 crore. Interest charges came down to Rs 114 crore from Rs Rs 234 crore, the result of sourcing funds by private placement from the low-cost GDR and Euro markets as well as by private placement of equity at large. As in the previous year, RIL has made no provision for direct taxes. About Rs 3,000 crore was invested by RIL in asset creation during the year and with another Rs 3,000 crore to be spent over the next two years, RIL might still have some years to go before it pays any direct taxes. Reliance's equity base has gone up sharply from Rs 324 crore in the previous year to Rs 461 crore as a result of issue of shares to shareholders of Reliance Polyethylene (RPEL) and Reliance Polyproplene (RPPL) consequent upon their merger with RIL in October 1994 as also to UTI and two other institutions on private placement. It collected a premium amount of Rs 1,266 crore from those issues (Rs 921 crore from private placements).

About 34 per cent of RIL's turnover in 1994-95 came from polyester staple fibre (PSF). Fibre intermediaries contributed 28 per cent, plastics 31 per cent and chemicals and textiles 9 per cent and 6 per cent, respectively. Export earnings were Rs 174 crore in 1994-95, up sharply from Rs 60 crore in the previous year.

The company is moving into oil and gas, power and telecommunications. The Reliance-Enron consortium has bagged the contract to develop the Mukta, Panna and Tapti oilfields. Reliance holds a 30 per cent stake in the venture with Enron and ONGC holding 30 and 40 per cent, respectively. Another $1.2 billion proposal has been submitted to the government by the Reliance-Enron consortium for the coal bed methane exploration and development project in MP and Orissa. Reliance and Enron will each have a 50 per cent stake in the project. Unrestricted repatriation of funds by Enron Exploration Company and a 10-year tax holiday exempting 30 per cent of taxable income following commencement of production are some of the fiscal reliefs asked for in the proposal.

Reliance plans to invest Rs 3,500 crore in power generation in Gujarat. The proposal is to set up a 1,000 MW power station at Pipavav in Saurashtra where two major projects – a copper smelting plant and a cement factory – are coming up. Reliance has floated a new company, Reliance Assam Industries (RAIL), to set up a gas cracker project in Tengakhat in Upper Assam. Reliance Industries is joining hands with MMTC in collaboration with the Australian mining comapny, Cluff Resources Pacific, for diamond prospecting and mining projects in Orissa. Reliance is also partnering De Beers in a diamond mining project in MP.

It has also launched a new generation of pillows under licence from E I Du Pont de Nemours, made from specially engineered hollow fibres with equipment imported from Du Pont.

Reliance Petroleum's refinery with a capacity of 15 million tonnes per annum will be commissioned in the second half of 1997. Reliance Industries is setting up a second polypropylene (PP) plant of 3.5 lakh tonnes near its refinery at Jamnagar to be completed in 1998-99. The second PP plant at Jamnagar will take Reliance's installed capacity to 7.5 lakh tonnes by the end of the decade. Reliance is already implementing a PP plant of similar capacity at Hazira along with a 7.5 lakh tonne, Rs 1,900 crore naphtha/natural gas multi-feed cracker. This is expected to be completed by 1996-97. Besides, the company's upcoming cracker project with a capacity of 2.2 million tonnes will be the largest multi-feed cracker in the world. RIL is also expanding its polyester and polymer capacities.

RIL, Salgaonkar Heavy Industries and a Candian consortium led by Lassing Dibben (Pacific) are to set up an 'Asian Bulk Terminal' off the Goa coast. The $230 million terminal is specifically targeted at bulk handling of solid and liquid cargoes. To implement its plans in the telecom and power sectors, RIL is promoting two new companies, Reliance Power and Reliance Telecom.

Apart from the private placement of equities referred to above, the company has raised Rs $600 million in the form of two GDRs ($450 million) and one FCCB ($140 million). With the FCCBs being converted into GDRs, the foreign equity raised by RIL will aggregate $590 million. It is estimated that the company requires an additional $750 million to meet the foreign exchange costs of its projects. Against the requirement of $450 million, RIL is proposing to raise $300 million through an FRN issue. Reliance has concluded a $150 million seven-year bullet loan, without any bank guarantee or government assurances. This is the first private sector transaction from India for a seven-year bullet maturity, meaning that the principal amount of $150 million will be repaid in a single instalment after seven years. The entire amount is being fully underwritten by Union Bank of Switzerland (UBS), ABN-Amro Bank and Bank of America. RIL proposes to meet the balance of its financial requirements through internal accruals.

KIRLOSKAR CUMMINS

On a Strong Wicket

Kirloskar Cummins (KCL), based in Pune, is the country's largest independent diesel/gas engine manufacturer in the non-automotive market. The company was promoted as a joint venture in 1962 by Kirloskar Oil Engines and Cummins Engine Company (CECO), USA, with a 50 per cent shareholding by CECO and 25.5 per cent by Kirloskar Oil Engines. KCL manufactures engines in the 60-1600 horsepower range and has a strong presence in the 150-1600 horsepower range. In the diesel engine market KCL faces competition from Hindustan Power Plus, Greaves and L&T. The main applications of these engines are power generation, construction equipment, industrial equipment, marine equipment, locomotives, etc. It also has collaboration with Holset Engineering Co of the UK for the manufacture of turbo chargers. The company's turnover for the year ended March 1995 stood at Rs 501 crore, up by around 23 per cent, from Rs 408 in the previous year. Despite a sharp rise in tax provision net profit was higher at Rs 5¼ crore compared Rs 34 crore in the previous year. A dividend of 25 per cent has been recommended by the directors. The company's performance on the export front has been satisfactory with export earnings of Rs 108 crore, down by a very small fraction from Rs 109 crore in

(Rs lakh)

the previous year. Exports accounted for about 26 per cent of total turnover in 1993-94. The 600-900 horsepower 'V-28' engines account for a substantial portion of KCL's exports with KCL having been identified by CECO as its sole worldwide supplier for the same. KCL has won the Engineering Export Promotion Council's award for export performance for the fifth successive year. In addition, the company also bagged the EEPC's Western Region Top Exporter Award for the highest foreign exchange earnings for any engineering product in the western region. However, the company's foreign exchange outgo too rose from Rs 85 crore to Rs 138 crore in 1994-95 because of larger import of components and sub-assemblies.

The company has many firsts to its credit. Along with being the first IC-engine manufacturer in India to get ISO 9001 certification, it is the first company to achieve recognition in the form of self-certification approvals from world class independent agencies such as Lloyds Register of Shipping, American Bureau of Shipping, Factory Mutual Research Association, Underwriters Laboratories, etc. KCL is also the first to develop and introduce in the country natural gas and dual-fuel engines for oilfields applications. The entire fuel system of KCL's engines known as the 'PT' fuel system is designed, serviced and manufactured by the company with its in-house technology. It allows the engine to be optimised at any load condition with a minor adjustment, thus providing KCL with the flexibility of customising its engine to customer specifications without making major changes in the fuel injection system. The result has been that KCL, unlike its competitors, is not confined to standard applications and has developed engines for varied applications. The PT system is developed and patented by CECO. The diesel engine industry is cyclical in nature but KCL has not been affected significantly by the ups and downs in the industry because, first, KCL's buyers come from diversified industries and the company is not dependent on any particular industry and, second, with a large number of engines in operation all over the country sale of spares is a substantial business for KCL.

BIRLA JUTE AND INDUSTRIES

Rapid Diversification

A new era in the Indian jute industry began with the setting up of the Birla Jute Manufacturing Company in 1919 by G D Birla. The first of the Birla group in India, the company is now known as Birla Jute and Industries. The company, which completed 75 years in August 1994, has come a long way from manufacturing only jute goods and now has a wide range of diversified

activities. It has seven divisions producing cement, jute goods, auto trim parts, textile yarns, calcium carbide, industrial gases, linoleum and PVC floor coverings.

The company closed its financial year ended March 1995 with net sales of Rs 750 crore against Rs 661 crore in the previous year, a rise of 13 per cent. Gross profit increased by 49 per cent, from Rs 37 crore to Rs 55 crore. Despite a sharp increase in tax provision, from a mere Rs 2 lakh in the previous year to Rs 250 lakh, coupled with a 4 per cent increase in the provision for depreciation, net profit doubled from Rs 14 crore to Rs 29 crore in 1994-95. Exports grew by 47 per cent from Rs 64 crore to Rs 95 crore. A dividend of 35 per cent has been recommended by the directors.

All the five cement plants of the company achieved the highest ever production of 29.74 lakh tonnes of clinker, 33.49 lakh tonnes of cement and 2.74 lakh tonnes of granulated slag against 29.07 lakh tonnes, 33.49 lakh tonnes and 1.85 lakh tonnes respectively in 1993-94.

The company is planning further expansion and has been on the look out for suitable sites to set up new cement units, possibly in Andhra Pradesh and Karnataka. The Chittor plant is proposed to be expanded by one million tonnes and expansion of the Satna unit is to be taken up in the second phase. The company's efforts to reduce energy consumption have led to modification of the fuller grate coller with the IKN clinker inlet distribution system at the Satna cement works. At Chittor the FLS grate coller was in the process of being modified. BJIL has commissioned a coal beneficiation unit at one of its plants at Chittor, the first of its kind in India. This became necessary because of the lack of consistency in the quality of coal supplied which left the company with two options, either to instal a coal washery or go in for a dry coal beneficiation unit (DCBU).

Sales of the linoleum division increased from 1.80 lakh sq metres to 2.86 sq metres, reflecting efforts to upgrade quality and introduce new designs. The company has signed two memorandums of understanding to modernise and upgrade technology. It has also entered into a joint venture with DLW Aktiengesellschaft of Germany, which has been marketing linoleum products manufactured by BJIL for the last several years, for the manufacture and export of quality linoleum. BJIL manufactures natural PVC linoleum which is made on jute backing with wood powder on top and is environment-friendly. The company increased sales of vinoleum from 3.75 lakh sq metres to 4.90 lakh sq metres and a start was made in export of vinoleum. Birla Vinoleum plans to launch PVC-coated wall paper and certain special grades of coated fabrics.

The jute division increased production from 59,168 tonnes to 72593 tonnes, a growth of 22 per cent. Exports went up to Rs 45 crore. As a result of a lower raw jute crop coupled with a small carryover from the previous year, raw jute prices rose and manufacture of standard goods became uneconomic, justifying the company's move into higher value added products. Production of such items during the year amounted to 19,410 mt, valued at Rs 49.30 crore, and constituted 27 per cent of total production against 13,389 mt, Rs 32.70 crore and 23 per cent respectively in the previous year. However, the export market support available to a wide range of jute goods has been withdrawn by the government with effect from March 31 this year. Also the EC, the largest buyer of high value jute products, has imposed a tariff of 3.4 per cent from January 1, 1995.

BJIL has diversified into the use of non-conventional jute fibre through its newly created auto trim division. The pilot plant with imported equipment has already been commissioned, with the first commercial export to the company's collaborator, EMPE-WERKE of Germany, being made in March this year. According to N C Vardarajan, senior vice-president of the auto trim division, a new technology involving jute felt impregnated with unsaturated polyester resin is being used for the first time in India. BJIL had also acquired know-how for the manufacture of PU sandwich headliners from EMPE and was negotiating with car . The auto trim division has given a new lease of life to the ailing jute industry by developing moulded door panels using jute felt.

The synthetics division recorded lower production, down from 6,145 mt to 5,994 mt as a result of shortage of viscose staple fibre from Grasim, the major supplier. The impact was reduced to a certain extent by a move towards blended yarns and import of fibre, which finds reflection in the import of raw materials rising from Rs 378 lakh to Rs 1,683 lakh. In order to reduce dependence on viscose fibre the company increased its coning capacity with the installation of additional imported autocones. Availability of autoconed yarn helped the division to increase exports.

The carbide division increased production substantially, with the highest ever production at 15,029 mt against last year's 11,839 mt, an increase of 27 per cent, thanks to efficient furnace operations and steadier power supply.

The company's cement division recieved the CAPEXIL Special Export Award for 1993-94, the fourth consecutive year for which its export performance was recognised by CAPEXIL. During the year the Durgapur cement works and Birla synthetics received ISO 9002 certification. This will give a boost to the company's marketing efforts, nationally and globally.

STRUCTURAL ADJUSTMENT IN INDIA :
An Assessment
Alternative Survey Group

This book makes an attempt to provide a more people-centric view of the Indian governments economic plans and policies, in particular, the impact of Fiscal Stabilization and Structural Adjustment Programme (FISSAP) on the Indian economy, its various sectors, social groups, and its long-term development, including the state of its natural resources.

The Alternative Survey Group in an informed group of eminent economists and social scientists who have contributed to this significant publication.

Fiscal Deficit: Return to Original Sin

The phenomenal rise in net RBI credit to the central government together with some slackening of the demand for commercial credit, reflecting a possible slow-down in industrial investment and production, have eased the severe shortage of liquidity experienced in the money market in the first quarter of this financial year.

I
Emerging Easiness in Liquidity

THE severe liquidity strain, experienced by the money markets in India during the first quarter of the current fiscal year, continued until the first half of July and has suddenly given way to some easiness during the latter half of the month. Apart from the seasonal factors of supply of and demand for banks' resources, the emergence of underlying signs of slackness in demand for bank credit due to some possible slow-down in industrial investment and output activity is probably reflected in the current trends. To an extent, the massive year-end bulge in banks' balance sheets as of March 31 and the subsequent unwinding make it difficult to get a clearer view of the liquidity situation from the available banking data for the early months of the year. As the size of the year-end build-up of banks' deposits and advances, arising from interest crediting, draw-down of public sector funds towards the fag end of the year and window-dressing, has been growing year-by-year, the process of unwinding has also been increasingly getting prolonged. Last year by July 22, the declining trend in aggregate deposits from the March 31, 1994 bulge had stopped; there was in fact a rise of Rs 1,486 crore by then. On the other hand, this year the aggregate deposits at Rs 380,160 crore continue to remain lower than the level of March 31, 1995 by as much as Rs 6,699 crore. Such a large swing in banking trends cannot be entirely explained by the last year's foreign exchange accruals and the consequential increase in bank deposits – a phenomenon which has been generally absent this year.

Overall, there is no doubt that deposit accruals this year have been more moderate than last year. However, a distinct feature of the current year's development has been the rise in bank deposits during July 1995 which has been much more than the increase in July 1994, despite the fact that the two periods are not comparable in that the foreign exchange inflow was much higher last year. The expansion in deposit liabilities of banks in recent fortnights may be attributable to secondary expansion arising from massive reserve money growth which in turn should be sourced to phenomenal increases in net RBI credit to the central government during the current fiscal year so far; the latter has already touched Rs 21,075 crore as of July 21 (Table 1). Government recourse to ad hoc treasury bills has also touched Rs 17,835 crore as on that date compared with a negative amount of Rs 995 crore in the corresponding period of the previous year. Apart from the use of ad hocs, the devolvement on the RBI of undersubscribed amounts in the 91-day TB floatations aggregated Rs 761 crore during July. Besides the RBI credit to the central government, the level of RBI refinance facilities used by the commercial banks, as also the DFHI and the STCI in the wake of the credit market stringency, has been about 75 per cent more this fiscal year (an average outstanding level of Rs 12,461 crore) as compared with the corresponding period last year (Rs 7,105 crore).

That the flow of liquidity was probably not from any fresh inflows of primary deposits is evident from the reduced tempo of financial savings in the form of accruals to various instruments. For instance, the Unit Trust of India (UTI) could mobilise only Rs 750 crore under its special offer of US-64 scheme as against Rs 3,000 crore achieved in the corresponding month of the previous year (though primarily because of the lukewarm response from corporate bodies in the wake of the withdrawal of section 80M of the Income Tax Act concerning intercorporate dividends as from this year-end). Subscriptions for other mutual fund issues, as also for capital issues of corporates, have been poor as compared with the previous year except for the bulk issue of the Industrial Development Bank of India (IDBI)'s initial public offering aggregating over Rs 2,371 crore, which has been oversubscribed essentially because of the financial institutions' clout and liberal subscription by investment institutions like the UTI, LIC and GIC and corporate bodies like the Reliance Industries, NOCIL and others. The subscription was facilitated by a series of initiatives such as (i) the exemption by the RBI of bank investments from the 5 per cent limit in respect of the equities of financial institutions; (ii) the permission granted by the RBI to primary co-operative banks and district co-operative banks to invest in equity issues of development financial institutions; and (iii) the declaration by the Maharashtra government of the IDBI equity issue as an eligible security for investment by provident funds and other trusts. There were also firm allotments made in favour of the investment institutions.

To an extent this forced extraction of subscriptions in favour of a mega issue has, as an immediate consequence, tended to augment liquidity with the banking system at least until after the funds are deployed by the IDBI in loans and other assets. Also, the declining trend in foreign exchange reserves since the beginning of the current fiscal year (a loss of Rs 4,303 crore until June 23, 1995) stood arrested in July (a rise of Rs 933 crore). The data published by the Securities and Exchange Board of India (SEBI) suggest that foreign institutional investors (FIIs) made a net investment of Rs 356.3 crore in June and Rs 654.08 crore in July 1995, which have been a substantial improvement over the investment levels since November 1994 (ranging from Rs 34 crore to Rs 211 crore).

II
Primary Auctions of Gilts

Though the central government's normal borrowing of Rs 3,700 crore (net) was completed by the end of June, it was the sizeable borrowing of Rs 19,000 crore budgeted under 'other medium and long-term loans' comprising zero coupon bonds and loans in conversion of maturity treasury bills which largely remained to be undertaken and to which the attention was paid in July.

Funding Operations

The government and the RBI had made a bold attempt to convert Rs 7,603.44 crore worth of 364-day TBs into a five-year security in April last but the market response, in the face of impending liquidity shortages, was poor; only Rs 1,653.58 crore (or 21.75 per cent of the offer amount) worth of bids at a cut-off yield of 13.25 per cent were accepted then by the RBI.

On July 10, the government offered to convert 12 per cent 1995 government stock maturing this October for a 13.25 per cent 1997 stock. Originally converted from 364-day TBs in 1993, the outstanding amount in 12 per cent 1995 stock was Rs 4,045.66 crore (It is a moot point if this should constitute a part of 'other medium and long-term loans' or that of the regular borrowing programme in gross terms). The auction

held on July 13 received again a damp response; the market offered only Rs 803.08 crore or 19.85 per cent of the eligible stock for conversion. Apart from the unattractive nature of the yield, the response clearly indicated market preference for liquidity. Even on the day of conversion, the 12 per cent 1995 paper was traded on NSE in two deals worth Rs 10 crore at a yield of 14.035 per cent as against the previous day's yield of 13.93 per cent.

Zero Coupon Bonds

Given the poor market response to the coupon bearing securities the RBI changed track and decided to offer zero coupon bonds on behalf of the government. Announced on July 20 and auction held on July 26, the notified amount of this five-year bond was Rs 3,000 crore. Zero coupon bonds are a novel instrument and they have always been a success. There have been two earlier issues of this instrument, both for a five-year maturity. The first zero coupon bond was issued in January 1994 and the second in February 1995.

The February auction had received Rs 2,393.30 crore as against a notified amount of Rs 2,000 crore. The cut-off price then was Rs 54.00 yielding 12.71 per cent. The previous first zero coupon bond issued in January 1994 was for a notified amount of Rs 3,000 crore and had fetched Rs 6,995.34 crore; at a cutoff price of Rs 53.90, the yield rate had worked out to 12.75 per cent.

By the time the latest zero bond was auctioned in the last of July, the liquidity situation in the market had undergone a process of easing as explained earlier, though the media was still predicting dire straight and one more devolvement on the Reserve Bank, but the RBI itself was confident of good response; the response to TB issues had already improved. For a Rs 3,000 crore issue, the Reserve Bank received bids worth Rs 4,808.80 crore but accepted the notified amount of Rs 3,000 crore for a cutoff price of Rs 51.19 which worked out to a yield of 13.85 per cent. The ruling yield to maturity (YTM) for the zero coupon bond 1999 was in the range of 14.10 per cent to 13.58 per cent in the last week of July.

Zero coupon bonds the world over are preferred by the issuer and the investor as well, particularly in an illiquid market. As the investor has to put in only the discounted amount, this instrument is well received especially when funds are scarce. Moreover, since there is no interest paid on this instrument during its full tenure, there is no tax deduction at source. Further, the instrument, being a discount instrument, does not generally face any risk of depreciation. As having been already discounted at issue rather sizeably, its value generally appreciates and hence its book value is rarely below its purchase price; this is because the market price has to accommodate the closing in of the maturity date. At the most the appreciation of this instrument will slow down if there is a future floatation with a higher coupon. As such, there will be no provision required for any depreciation of this instrument. For the investors in the Indian zero coupons the RBI provides an added attraction in the form of repo facility. For the issuer who is strapped for cash, this is a convenient form of raising funds as during the tenure of the instrument, there is no cash outflow towards interest payment. In zero coupon bonds, there is only one bullet payment at the end of the tenure for repaying the principal and interest. This gives ample time to the issuer to plan his cash outflow.

364-day Treasury Bills

Response to the two auctions of 364-day TBs during the month on July 7 and July 21 remained subdued as the liquidity situation continued to be weak. The Reserve Bank was able to raise only Rs 17.18 crore in two auctions and that too at such yield rates as 12.71 per cent and 13.16 per cent, respectively, in the two issues. Last year, during July, this instrument had received good market response with the government collecting Rs 1,581 crore at yield rates of 10.04 per cent and 9.82 per cent, respectively, in the corresponding two issues. (Table 1).

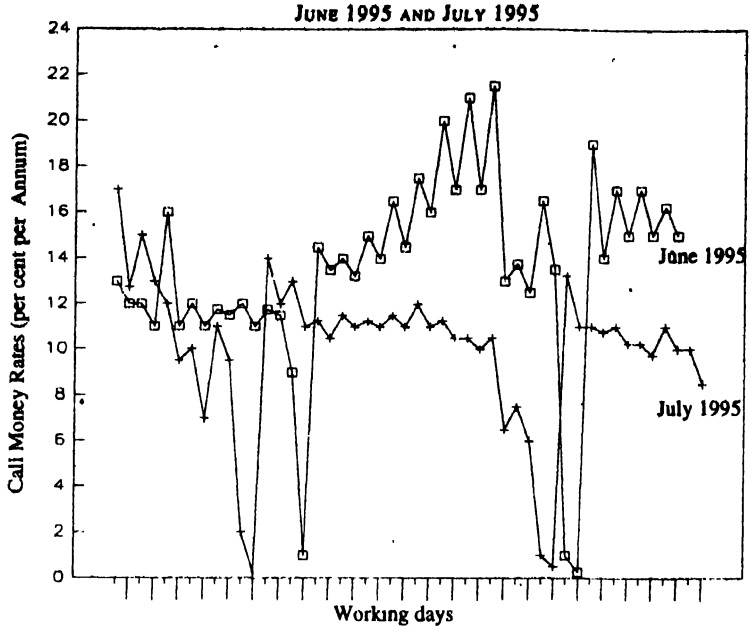
Significantly, with the improvement in the liquidity situation towards the end of the month, the response to the 364- day auction held on August 2 was exceedingly good. The Reserve Bank could raise an amount of over Rs 834 crore in this auction although again the yield given was as high (13.16 per cent) as in the preceding auction.

91-day Treasury bills

In the 91-day TB issues, too, the response in the second half of the month was qualitatively different from the first half (Table 2), with the government raising from competitive bidders Rs 615.02 crore in the second half in contrast to only Rs 16.25 crore in the first half. The last auction of the month also saw the yield rate slide down from 12.97 per cent to 12.71 per cent thus arresting the rising trend since April. For a total notified amount of Rs 1,000 crore in the first two auctions, apart from Rs 16.25 crore from competitive bidders, the RBI collected from non-competitive bidders Rs 370 crore and borne the devolvement to the extent of Rs 613.75 crore. The yield rate rose from 12.71 per cent in the first auction to 12.97 per cent in the second position.

There was, however, a sudden turnaround in the market response in the auction held on July 21. For a notified amount for Rs 500 crore, the government received competitive bids worth Rs 474.95 crore and non-competitive bids worth Rs 150 crore. In order to prevent the interest rates from rising beyond reasonable levels, the Reserve Bank preferred to take a small slack and rejected a sizeable portion of the market bids. It accepted only Rs 202.70 crore from competitive bids but all the non-competitive bids for Rs 150 crore, itself taking a devolvement of Rs 147.30 crore; this prevented the yield rate (12.97 per cent) from rising.

The next auction attracted warm response, with the Reserve Bank receiving 69 competitive bids and 4 non-competitive bids for a total amount of Rs 1,151.38 crore. The Reserve Bank accepted 37 competitive bids worth Rs 412.32 crore at a cutoff price of Rs 96.92 thus bringing the yield further down from 12.97 per cent in the previous auction to 12.71 per cent. With the non-competitive bids getting an allotment of Rs 87.68 crore, there was no devolvement on the RBI.



- Clearly, in the wake of the market criticism, the Reserve Bank opted to cutoff at a little higher rate and rejected only a minimum from the competitive bids rather than go in for a sharp reduction in the rates with the help of non-competitive bids. In fact, the Reserve Bank could have further reduced the rate of interest as the bids received in the non-competitive category were substantial at Rs 280 crore. However, the Reserve Bank decided to allocate only Rs 70.42 crore to non-competitive bidders, that too in partial allotment. Borrowings from non-competitive bidders, which generally are state governments, is only another form of monetisation.

III
New Issues of Other Money Market Instruments

Certificates of Deposits

The last fortnight of July saw hectic activity in the CDs market with the financial institutions such as, the IDBI and ICICI entering this market offering as high as 18 per cent interest. The interest rate went up in the CD market following the decision of the public sector banks to reject the directive of the Department of Public Enterprises that the public sector undertaking could park their funds in CDs only of banks which have obtained credit rating. It is learnt that State Bank subsidiaries and some weak nationalised banks were the most affected by the DPE directive. The DPE directive had made credit rating compulsory for those public sector banks which desired to attract PSU funds by issuing CDs but whose minimum paid-up capital was less than Rs 100 crore. The DPE later withdrew its directive.

GRAPH A: DAILY QUOTATIONS OF HIGHS AND LOWS OF CALL MONEY RATES, JUNE 1995 AND JULY 1995

According to an estimate, public sector undertakings contribute as much as 3 per cent of the total bank deposits. The State Bank of India had alone mobilised Rs 2,500 crore at a rate of 13.50 per cent in the first quarter of the current financial year. With its large deposit base, in which current account deposits have a larger share, the average cost of funds may not have been too high for the State Bank.

With the liquidity crunch affecting the banks as well as financial institutions, both vying for PSU funds is quite understandable. The State Bank had offered a rate of 11 per cent till December 1994. The rates were increased to 13 per cent in February 1995 and subsequently to 13.5 per cent. Besides SBI and financial institutions, other players in the CD market were Corporation Bank, IndusInd Bank and SCICI.

Commercial Paper

Towards the end of the month, the recycling of available liquidity in the market has induced fresh issues of CP by corporates which have been picked up by banks at reasonable rates of interest ranging from 13.75 to 14.50 per cent. Widely quoted CPs are those of Dabur (Rs 10 crore) and non-banking finance companies like Kotak Mahindra. New CP issue of GAIL, Voltas and Pfizer were reportedly in the pipeline.

Debentures

With the capital market stagnant and banks faced with a liquidity crunch, the market showed some preference for debentures during the first quarter of the current financial year. This was reflected by the advances portfolio of ICICI. As against its portfolio of debentures which was 9.5-10 per cent of its loans to corporates during 1994-95, its debentures portfolio was 20 per cent of its corporate loans in the first quarter of this financial year.

PSU Bonds

The government was likely to announce the quota of SLR bonds for the PSUs for 1995-96. It is likely to further reduce the volume of guaranteed bonds in keeping with the policy of eventually doing away with the support to PSUs. The government has already reduced PSUs' quota of SLR bonds from Rs 3,000 to Rs 700-800 crore in the past three years. In the context of the tight liquidity position of the market, PSUs are likely to raise funds at a high rate of over 14 to 18 per cent as the government paper offered 14 per cent in the primary market and 14.5 per cent in the secondary market.

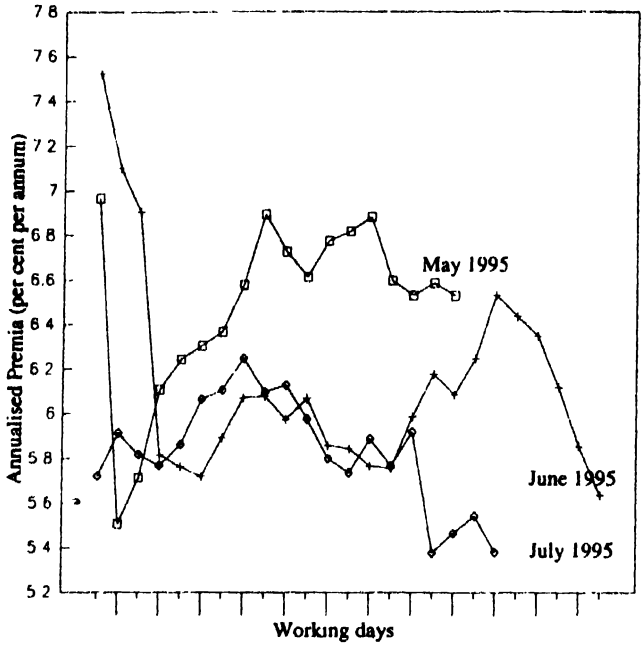
IRBI proposed to raise Rs 50 crore through private placement of bonds. The five-year bonds issue offering 15 per cent would close on August 31. The Nuclear Power Corporation's bond issue was oversubscribed. For a Rs 100 crore issue, the NPC received Rs 175 crore. Nearly 75 per cent of the issue was subscribed for by provident funds. The NPC has decided to retain the oversubscription.

Floating Rate Notes

State Bank of India raised the interest rate on its floating rate bonds (FRNs) by two percentage points to 15 per cent. It may be recalled that the State Bank had simultaneously floated an equity and debt issue in 1994. The bonds totalling Rs 1,000 crore with a ten-year maturity carried a floating rate of interest payable half-yearly at three per cent over the maximum term deposit rate. The interest rate is subject to refixing every six months on January 1 and July 1.

ICD Market

It was reported that non-banking finance companies and corporates were doing ready forwards in units of UTI US64 scheme for fear of default in the inter-corporate deposits market. In the previous months, corporate giants like Shaw Wallace had already defaulted on their repayment obligations. It was reported that the creditors of Shaw Wallace had asked the company to mortgage its assets against the ICD loans advanced to it. The rates in this market are also reported to be as high as 26 per cent in normal circumstances. There also have been companies which, despite good credit ratings, have not been able to mobilise funds even at rates as high as 50 per cent during the past couple of months due to the liquidity crunch being experienced by the financial markets since September last.



In July, the situation was not so critical. Yet, for fear of default on ICD borrowings and as bank finance was difficult to obtain due to the tight monetary policy of the Reserve Bank, non-bank finance companies and other corporates indulged in pledging their most liquid financial asset, viz., units of US64 to borrow in the ICD market. The mechanism used for such borrowings was interesting. To avail of funds, a corporate would pledge US64 and enter into a ready forward agreement with another corporate or an NBFC to buy back the instrument at

a mutually agreed price. While use of collateral improved the counter-party risk in this hitherto unsecured loan market, it also changed the very character of this instrument. Incidentally, the use of ready forwards is not permitted except in treasury bills and some specified gilt-edged securities.

Bills Re-discounting

An important instrument in the money market has been in the background since the securities scandal hit the Indian banking system in 1992. This short term, self-liquidating kind of instrument was expected to be useful to corporate borrowers and the Reserve Bank had been encouraging its use for better funds management in the 1970s. The instrument, however, came to be widely misused with rampant accommodation bills getting re-discounted for raising funds to invest in the capital market rather than supporting productive activity. In the post-scam period, the Reserve Bank put several restrictions on bills re-discounting, such as a ban on banks to re-discount the bills discounted originally by non-bank finance companies and the increase in the minimum tenure of bills re-discounting to 15 days.

These measures have resulted in lower volumes in the bills re-discounting market, although the spreads have gone up along with the cost of funds for these non-banking finance companies. With the current liquidity crunch the rates have gone up to as high as 18 to 26-27 per cent depending on the risk profile of the borrower. The present volume in this market are estimated to be around Rs 7,000 crore. The discounted inland bills portfolios of scheduled commercial and co-operative banks today constitute about Rs 7,600 crore.

It would be fallacious, however, to conclude that the misuse of this instrument has completely stopped. Many non-bank finance companies now re-discount their bills with cash rich corporates rather than commercial banks. The newer banks are also keen players in this market and are reportedly indulging in accommodation bills financing in a big way.

Foreign banks have emerged as aggressive players in this market as arbitragers. They are reported to be borrowing by re-discounting bills towards the end of a reporting fortnight when the call rates are low and lending the funds by way of repos, with many foreign banks achieving a spread of about two percentage points by adopting this route.

Meanwhile, the Kerala State Industrial Development Corporation has introduced a bills re-discounting scheme to help companies in the state of Kerala to raise their working capital requirements. The rate of re-discount will be 3.5 per cent above the prevailing prime lending rate. With the processing fees and non-refundable upfront fees for documentation, it will currently cost 21 per cent to the borrowers. With inter-corporate deposits rates well above 25 per cent, corporate borrowers are reportedly finding the offer attractive.

IV
Call Money Market

The call money market experienced relative stability and easiness for the greater part of the month with rates generally moving in the range of 12-10 per cent (Tables 3 and 4).

The easiness in call rates in the first half of July was partly attributed to inflow of cash on account of the release of interest amounts worth about Rs 600 crore by the RBI on the banks' statutory reserves. In the second half, call rates declined partly due to expectations of a cash inflow into the system through the return flow of food credit and interest payment on capitalisation bonds.

In an otherwise easy call money market in the first week of July, call rates rose to 11 per cent on July 6 on reports that the State Bank of India was borrowing in the market, as also opening of the mega IDBI issue. As call rates went down in the first week of July, the secondary market in government securities saw an appreciation by 10-15 paise each. 364-day Treasury bills maturing in September traded at a YTM of 13 per cent and those maturing in August traded at 13.9 per cent YTM. Similarly, 91-day treasury bills maturing on July 29, offered a yield of 13 per cent.

The second week of July opened on a quiet note and players shifted attention to the secondary market of government securities as there was little activity in the call market. The daily average trading volumes in the outright market for gilt-edged securities was

around Rs.100 crore and in the repo market about Rs.150 crore during the second week.

Call rates continued the easy trend in the third week of July remaining at the 10-11 per cent levels. Institutions like the Unit Trust of India were in the market as lenders. UTI had collected Rs 800 crore through its customary concessional sale offer of US64 which it had reportedly deployed in the call market. Sentiments in the market during this week were also affected by the RBI governor's speech at Madras where he cautioned on what he described as "almost profligate" use of bank credit and indicated that the RBI's support to government borrowings will not be unlimited. On July 21, i.e the Reporting Friday, the rates fell to the customary 0.5-1 per cent indicating normalcy in the market.

The last week of July opened at 10.75-11 per cent. The offer of Zero coupon bonds to be auctioned on July 26 dominated the market scene during the this week. The presence of State Bank and UTI as lenders in the market throughout this week also caused easy conditions in the market, with the call rates ranging from 10.0 to 8.5 per cent in the later part of the week (Graph A).

Forex Market

Developments in the inter-bank foreign exchange market during July were characterised by their trading, reduced volatility in exchange rate, even a marginal appreciation of the rupee above the RBI's long-standing reference rate of Rs 31.37 due to inflow of dollar on account of FIIs' gross investment to the tune of US $858 million, and considerable and persistent, weakening of the annualised forward premia (six month) from 6.2 per cent to the lowest level in months of 5.50 to 5.75 per cent (Graph B).

Secondary Market

Dated Securities

The secondary market witnessed brisker trading activities in government securities as the volume of trading and number of traded stocks increased during July. In TBs, the yield difference between primary and secondary market got narrower and finally towards the end of the month, turned positive. The relatively easier condition in call rates and RBI's directive regarding fixation of permanent and current category to 60:40 level from the earlier level of 70:30 led to offloading of a large number of securities, mostly low coupon, long-dated regular stocks, resulting in higher turnover. However, the short-dated converted securities like 12 per cent, 1995 and 12.75 per cent 1996 were underpinned by strong demand and remained firm (Appendix Table).

Yield Curve

With the improvement in liquidity situation and expectations of an unbridled expansion in government expenditure essentially to be financed through ad hocs and other debt monetisation indicating thereby large primary money expansion and possibly a gradual fall in the interest rate structure over the months, the secondary market yield structure started moving downwards, which was also reinforced by the policy stance adopted by the RBI in regard to open market operations and more significantly in determining the yield rates on primary issues of government paper. Consequently, the average yield curve for the month remained inverted, or at any rate flat (Graph C and D). However, on a day of maximum transactions (July 28) the combined yield curve for 364-day TBs and GOI dated paper appears upward sloping and fairly consistent with normal expectations (Graph E).

Other Developments

STCI's Operations

The Securities Trading Corporation of India – the primary dealer designate – started offering two-day quotes in select government securities and treasury bills from June 28. The STCI announces indicative opening rates every morning and the rates vary according to the volume and movement of market rates during the day. The rates quoted by STCI so far have indicated thin spreads; 14 per cent 2005 stock, for instance, was offered for purchase at a rate of Rs 100.15 and for sale at Rs 100.30.

It is difficult to gauge the market response to STCI's offers from the SGL account operations as the prices quoted by STCI are only indicative and transactions may or may not take place at those prices. As is evident, there was little activity at STCI's rate in the market. This was on account of the restriction put by STCI on transactions. While banks could purchase any amount of securities or treasury bills offered by STCI, for its own purchases from banks, STCI

(-) means no trading YTM = Yield to maturity in percentage per annum CY = Current yield in per cent per annum * Yield rates of these sub-groups of TBS and dated securities have been used for the graphs.

Notes: 1) Yields are weighted yields, weighted by the amounts of each transaction. 2) Current yield has not been worked out for treasury bills.

placed a ceiling of rupees one crore. STCI cited resources constraint as a reason for this restriction. According to STCI, unlimited purchases could also result in dumping of unwanted, low-yielding securities from the market with the STCI.

Given the early stages of institutional development in the debt market in India, the cautious approach of STCI is understandable. However, being the first primary dealer to become operational before the official announcement on the list of primary dealers by the RBI, STCI's operations in this respect have great significance.

NSE Operations

The total traded volume in the wholesale debt market at the National Stock Exchange (NSE) crossed Rs 10,500 crore mark in its first year of operation ended June 30. Debt market operations at the NSE started with 224 securities. The list of securities now has 425 scrips. As against 19 members at the beginning of NSE, it now has 375 active members.

Interestingly, the NSE has entered the second year of its operations with an improvement in its trading volume, from Rs 1,203 crore in June to Rs 1,682 crore in July. Reflecting stable conditions in the money market and the debt market having obtained some transparency, the buy and sell orders on the NSE are getting generally evened (see Table 5).

[Statistical computations for this paper were undertaken by V P Prasanth.]

POLICY WATCH

Life after Enron

Jayati Ghosh
Abhijit Sen
C P Chandrasekhar

The Enron agreement was only one of eight so-called 'fast track' agreements with multinational companies on terms, essentially dictated by the union ministry of power, which are ruinous for the concerned state governments and for power consumers. However, the danger of focusing only on these specific projects is that attention may be diverted from the more fundamental task of framing a new policy for the power sector. What are the dimensions of the crisis facing the power sector and how can it be resolved? Confusion on these basic issues has led to many reactions to the Enron fiasco which are erroneous and misleading.

THE extensive public discussion in the wake of the cancellation of the Enron-led Dabhol power project by the Maharashtra government is certainly welcome. What is perhaps most noticeable about this discussion, which is basically about whether the project should have been cancelled or renegotiated, is that there are now fewer takers for the argument that the outlook on the power situation is so bleak in the near future that private foreign investment in the power sector should be sought immediately, whatever the costs. The most amusing part of the Enron fall-out is that those who were till now the most ardent supporters of the central government's 'fast track' approach to the power sector have suddenly been converted into advocates of more protracted negotiation. And, in the process, it is also illuminating to watch multinational companies with similar projects in the pipeline respond rapidly to the 'new' environment. Thus, GE struck the first blow by revealing that it could bid much lower than Enron for the Dabhol project, thereby breaking an implicit cartel that leading companies had developed with respect to negotiations with government; and all the companies involved in the 'fast-track' projects have responded by lowering project costs and estimated tariffs. Cogentrix has already knocked Rs 200 crore off from the cost of its Mangalore project, and may well bring down the cost further with a little more pressure. Similar tendencies are under way in Andhra Pradesh and Orissa, where multinational companies are suddenly proving to be remarkably flexible in adjusting estimated costs downwards and in meeting other demands they had earlier rejected. So other state governments must indeed be grateful to the Maharashtra government for this positive externality of the scrapping of the Enron deal, as well as shamed by this reflection on their poor bargaining skills.

The critics who argue that the Maharashtra government should have renegotiated with Enron, rather than cancel the project outright, are certainly correct in pointing out that the decision to cancel the contract was driven mainly by political considerations. The BJP-Shiv Sena alliance had stolen the issue from the Left in a blatant pre-election attempt to garner more broad-based support. With little expertise on economic or technical aspects of the matter, the alliance borrowed arguments from the Left and from independent bodies such as the National Working Group on Power, and then managed to mix this into the anti-corruption cocktail with which it had successfully campaigned against Sharad Pawar. However, when it came to making the actual decision to cancel, there was much heart-burning in the saffron combine. This was in part because the Pawar administration had made things difficult by legally binding the Maharashtra government to the deal in its last days in office, but mainly because the BJP is still led by those who are averse to being seen as unfriendly to foreign investment. Enron's reaction to the BJP-Shiv Sena victory was therefore a predictable one. With the aid of certain ministers from foreign countries, it raised the bogey that cancellation would put foreign investors off, but, simultaneously, it offered to renegotiate the contract. On a more legalistic plane, it formally demanded $ 100 million as compensation for cancellation, and then proceeded to speed up both the pace of investment and work at the project-site, knowing full well that this would enable it to demand more compensation. Thus, Enron gambled on the BJP leadership's desire for a pro-MNC image, while taking legal steps to guard its flank if the gamble failed. But this was a bluff waiting to be called. Having announced its compensation claim, Enron had opened up the possibility that the Maharashtra government could cancel the project while accepting arbitration within the terms of the contract, and so be immune to any accusation of violating contractual obligations. On assuming office, the new government was therefore faced with a simple economic question: was cancellation of the project worth the $ 100 million, or Rs 300 crore, which was the most that Enron could have demanded in any arbitration provided for in the contract? As is by now evident, just the gains from the offer of all the other companies to renegotiate would have economically justified such immediate cancellation with compensation.

But, in fact, the final decision, by its very nature, could not be anything but political. Not only were there differences of perceptions within the BJP-Sena combine about the economic merits of foreign investment in the power sector, but the combine, never strong on economic arguments, had pegged this issue essentially as part of its wider campaign against corruption of the Congress. As it stands, the decision represents a victory for those within the saffron parties who argued that the political mileage that the issue had brought would evaporate if the deal was not cancelled. But the pulls and pressures within these parties resulted in the decision to be delayed so much that Enron could push up its compensation demand from Rs 300 crore to about Rs 1,000 crore. Reportedly, the Maharashtra government has decided, against the advice of the bureaucracy, to neither renegotiate the contract nor accept arbitration on this higher compensation demand. And the resulting fall-out of the delay, that either a larger compensation will have to be paid or there is danger of being seen as defaulter of contractual obligations, is the crux of the argument advanced by those who are today in favour of renegotiating the contract.

Given the ambivalence in the saffron community, the contract may yet be renegotiated if political considerations abate after the next general elections. But, whatever happens eventually, it has to be noted that the cancellation has so far had positive effects even beyond the willingness of all the concerned MNCs to renegotiate their existing positions. Probably the most important of these is that a signal has been sent to the multinationals that Indian democracy, despite all its weaknesses, will not allow them to strike deals with governments, especially lame-duck governments, which are less than

transparent. In future multinationals are likely to avoid the sort of secrecy that Enron imposed (or tolerated) in its negotiations with the Pawar administration, and if this results in these corporations demanding improved transparency in agreements to come, the gain will be immense both in terms of political probity and simple economics.

Missing the Point

Those arguing for renegotiation rather than cancellation are thus missing the point entirely: cancellation was a necessary bargaining move to gain credibility for any renegotiation after the abject behaviour of the central and state governments in their previous negotiations. These critics may well be correct in that there is now a difficult dilemma, involving either high compensation or loss of investor confidence in the ability of governments to honour contracts. But, again, they are missing the point. As argued above, neither of these would have arisen had the Sangh 'parivar' really been clear about the issue and cancelled the project immediately upon taking office. The real problem is not that the project has been cancelled but that prevarications within the parivar prevented immediate cancellation.

Moreover, supporters of renegotiation with Enron tend to play down the costs of the original contract, and indeed of the entire 'fast track' policy of the government of India, when, after conceding that the scrapped contract was bad economics, they argue that a better contract still be struck. In this context, it is worth noting that these critics of cancellation do not in the main disagree with the Munde Committee's observations on the many costs and adverse economic implications of the deal. These observations, almost all of which had been made earlier by others, such as the National Working Group on Power, and to which the committee has given its official imprimatur, include

(1) the high return on equity investment to the investor, with a floor of 16 per cent in dollar terms;
(2) an effective internal rate of return of more than 30 per cent given the guaranteed offtake of 85-90 per cent at the expense of other cheaper sources of power that the State Electricity Board could have accessed;
(3) a government of India guarantee of payments at this rate in case the Maharashtra State Electricity Board was unable to pay;
(4) an incentive to inflate capital costs in relation to similar projects abroad and those potentially available indigenously, stemming from these guarantees, by including in this cost non-plant and equipment items such as 'upfront fees' and 'technical consultancy fees', etc, as well as high non-tendered provision of generation equipment from the equity partners in the project, General Electric and Bechtel,
(5) high recurring costs and high and escalating tariffs on the power to be supplied, since the expenses chargeable during the life of the project provide increases for inflation as well as for escalation of other components of cost such as management fee, testing fee, commissioning fee, insurance charges, etc,
(6) unfavourable financing terms, since rates of interest on debt are fixed until the closure of the project, even though typically debts on such loans can be renegotiated as the risk falls with the life of the project, and
(7) substantial foreign exchange costs over the medium and term, in terms of large net outflows after the initial relatively short period of capital inflow to the extent that the cumulative outflow has been estimated (by the National Working Group on Power) to be about 30 times more than would occur on an indigenous route for the same power supply.

And, it is important to remember that the Enron agreement was only one – in fact, the first – of a number of such 'fast track' agreements with multinational power companies that have been recently negotiated by state governments as part of the government of India's new power policy explicitly based on offering concessions to foreign investors. The package of concessions suggested by the ministry of power, which have guided negotiations in all of these eight projects, includes a 16 per cent rate of return on equity at a plant load factor of 68.5 per cent, with 0.7 per cent more for every percentage point of PLF over 68.5 per cent. In addition, the concessions include the computation of power tariffs in foreign exchange, guaranteed offtake (in terms of power demanded) higher than the current load demand, the use of imported oils and gas as fuels instead of indigenous fuels and depreciation of capital at 8.24 per cent per annum instead of the earlier 3.5 per cent. What has become evident is that all of the agreements so far negotiated have been on terms which are relatively less favourable for the state governments and for Indian consumers – so much so that the multinationals involved have shown great alacrity in offering some small revisions in their agreements in their desire to avoid anything like the Enron fiasco. Clearly there is substantial scope for renegotiating all of the other projects to ensure better terms and lower costs for the country.

Need for New Policy

The danger, however, is that focusing only upon these specific projects with their costs and benefits, can actually obscure the more fundamental need for a new and transformed policy towards the energy sector which will be better suited to the country's needs. There is no doubt at all that the power sector in India today is in crisis; the question is what the dimensions of this crisis are and how it can be resolved. Confusion over this basic question has led to many reactions to the Enron issue which are erroneous and misleading.

Thus, even today it is argued in certain sections of the press, as well as by some officials, that foreign private investment by multinationals is the only option for a country facing a power situation that is woefully inadequate in terms of availability and consistency of supply, and is predominantly serviced by bankrupt public power utilities. This argument is so widespread that it is even implicitly accepted by some critics of the Enron deal, such as the Shiv Sena spokesman who is reported to have said "we do not need power". And, most strikingly, in Orissa, where, like elsewhere, the new Congress government has decided to renegotiate the Ib valley project, it has accepted without much public discussion a much more far-reaching and comprehensive strategy for the power sector than the previous administration reached with external donors.

Under this $2.6 billion plan for restructuring Orissa's power sector during 1996-2001, generation, transmission and distribution are to be separated and put on offer to different companies, with private financial participation to the tune of $1.45 billion. According to reports, the plan envisages that existing projects with the Orissa State Electricity Board would be handed over the Orissa Hydro Power Corporation (OHPC), the Orissa Power Generating Company and the National Thermal Power Corporation (which is to get Talcher in lieu of power the OSEB has not paid for), while future thermal power projects would be left to private (foreign) investment. In addition, a company (GRIDCO) is to be set up to take over bulk procurement from private generators for supply to private distributors. Finally OHPC and GRIDCO would be gradually privatised.

The World Bank, which is the prime mover of this programme, sees such 'reforms' as inevitable given the deteriorating power situation, lack of resources with the SEBs and state governments, the constraints on additional funding from the Power Finance Corporation and limits to the counter-guarantees that the centre can provide. But the costs are also clear. Despite the hikes in power tariffs in the past three years, these are expected to rise in Orissa at a minimum by 15 per cent a year till 1998, as part of a process aimed at taking tariffs to levels where they provide a return of 16 per cent of equity investments. It is also expected that rationalisation would lead to some loss of

employment in the OSEB, when staff are transferred to a new cadre. And, finally, while control over generation and distribution is to pass almost completely to the private sector by year 2001, regulation is to be scaled down and shifted out from the hands of the state to an 'independent' regulator, financed with a cess on the private generating and distributing companies. In sum, any attempt to influence power sector growth taking into account objectives other than private profits is to be abjured.

Indeed, such wholesale privatisation programmes, premised on the assumption of impending power shortages and of the insolvency of SEBs, are, if anything, likely to be put sooner on the agenda as a result of the Enron debacle. Already, some erstwhile critics of Enron, for example Kirit Parikh, have taken the position that not only should the deal itself be renegotiated but also that transmission and distribution be privatised to ensure that future Power Purchase Agreements are drawn up on purely commercial terms and do not get enmeshed in political controversy. This is a seductive idea which is likely to be clutched at by the reformers now reeling from the political fall-out of the obvious flaws in their earlier 'fast-track' policy. But the basis of this argument, that massive investment is unavoidable and that SEBs are bankrupt and too inefficient, is not only a massive simplification, it is also based on a misunderstanding of the basis of the present predicament of the Indian power sector.

Overestimation of Demand

There are two aspects of the power problem that need to be sorted out very clearly before strategies can be effectively pursued. The first relates to the overall requirement of power in the country – the estimation of future demand. Here a case can effectively be made that the official government estimates are very much on the high side, and constitute an exaggeration of the power requirements and therefore also of the installed capacity required and the capital costs of such capacity. Thus, the official estimate is that the country needs a total of 1,04,000 MW of power in the Eighth Plan period, and an additional 94,000 MW in the Ninth Plan. However, as the Working Group on Power has argued, these are gross over-estimates. As against a peak demand of 64,000 MW expected by the government in 1994-95, the actual peak demand was only around 58,000 MW; and, although the official demand estimate for 1996-97 is 74,000 MW, this is unlikely to exceed 67,000 MW by the end of this Plan period. In the meantime, the actual installed capacity at the end of the Eighth Plan period will be at least 89,000 MW even if no new private plants come on stream and public sector investment is restricted to ongoing projects. Shortages will certainly continue under the worst-case assumption that there is no improvement in the low current capacity utilisation rates, but, even then, the percentage shortfall in 1996-97 will not be much higher than at present. And, with plausible assumptions about improved utilisation, the actual shortfall may be much lower with better management even if there is no further investment than the public sector projects already under way. Indeed, one reason why there is no longer the same sense of crisis about the immediate future, and therefore renegotiation rather than 'fast-track' is the current buzz-word, is this recognition by most power experts that previous demand estimates were unduly exaggerated.

Besides this problem of overestimation of demand, there are further difficulties with the approach to energy use and its planning. The basis of the current policy is that demand for power is essentially autonomous of the power policy, and the role of policy is to ensure an adequate supply to meet that demand. The interactions between the form and manner of supply, and demand, are totally ignored. In addition, as A K N Reddy and others have pointed out, this approach is typical of a energy paradigm which is increasingly discredited around the world.

Such criticism becomes even more weighty when one notes that not only is there very

little investment on reducing energy requirement by improving efficiency at the user end, but that all the demand-supply projections assume that generation has to be 20 per cent higher than final consumption to compensate for inefficient transmission and losses in distribution. In fact, with current shortages less than transmission and distribution losses, it can be plausibly argued that this, rather than insufficiency of aggregate power generation, is the real problem today. Thus, a World Bank study of 1990 indicated that using existing tie lines and transferring electricity from surplus to deficit areas could have reduced shortages by half. Similarly, integrating the grid and better maintenance of existing capacity can bring down plant margins considerably, which would also reduce the need for creating additional capacity. Clearly, much greater attention than currently needs to be given to issues other than investment in generating capacity. And advocates of comprehensive privatisation may argue that their proposals do address this because it is precisely the inefficiency of the SEBs which is at the root of the problem.

Finding the Resources

The other important constraint in the power sector today is no doubt the shortage of investible resources. The capital crunch which prevents much-needed investments in additional electricity generation capacity has become the single most important variable for both government and private industry, and – thanks to the constant media attention – also dominates the perceptions of ordinary citizens. Yet not only is this shortage typically exaggerated because of the inflated estimates of demand, but discussions of this problem usually neglect to mention the primary causes of this capital shortage. The domestic sources of investible funds for the power sector include the government, the State Electricity Boards (SEBs) and the domestic private sector, while foreign sources include multilateral financing institutions, transnational banks and direct foreign investors. For various reasons, only the last source is seen as relevant for India today, and domestic sources of finance are written off altogether. The inability to consider domestic sources of finance as feasible options springs from what is ultimately the real source of the power crisis – the chronic financial difficulties of the SEBs.

On the face of it, the SEBs are the obvious source of new investments in the power sector, and ideally they should be able to raise the money required for any new investments in generation capacity either from their own resources, from banks or from the government. Yet the various SEBs across the country suffer from continuing losses and are in very dire financial straits, so much so that their combined losses total more than Rs 8,000 crore per annum. This amount is not only a massive drain on the public exchequer, but it is also routinely touted as glaring proof of the 'inefficiency' of these public sector undertakings. However, it is manifestly unjust to accuse the SEBs of inefficiency when they are not allowed to run as autonomous businesses and their problems stem from causes that are essentially political in nature.

The greatest portion of the losses of the SEBs is made up of two components: the underpricing (relative to cost) of power to final consumers, and the losses incurred in the transmission and distribution of power. Both of these amount to subsidies to consumers: the first explicit, and the second implicit because much of the 'losses' in transmission come from unauthorised lines and users who are not prevented from accessing the power because of political reasons. There is no question that the pricing of power is a highly sensitive political issue which also has significant implications for growth, and it is hard to think of any country or region where such pricing is left entirely to market forces. But the point is that the decision to keep electricity tariffs at a certain level – which is ostensibly made by the SEBs but is actually a political decision of governments – has direct implications for the profitability of the SEBs themselves, and certainly affects the possibility of internal resource mobilisation for future investment.

Each of the eight 'fast-track' power generations schemes with foreign investors that has come up under the aegis of the new power policy of the GOI would actually make matters worse for the SEB concerned. Each of them adds to the financial burden of the SEBs, by raising the cost per unit of electricity generated, by imposing plant load factor conditions which force the SEBs to buy the highest cost power even in non-peak periods, and in a variety of other ways that are embedded in the contracts. Thus these schemes would actually worsen the power crisis in the country in the medium term because they would exacerbate the root cause of the problem, which is the financial plight of the SEBs. They are therefore undesirable and ineffective as solutions to the problem quite apart from the other negative aspects of the contracts.

Case for Subsidy

But if that is so, then what would solve the problem of ensuring safe, reliable and adequate power supply in the country as a whole? Once again, the answer must come from a changed perception of the role and functions of the SEBs since, as we have seen, they are at the heart of the problem. Clearly, the present situation is unsustainable no matter what type of economic regime is envisaged. The SEBs must be made either commercially viable or fiscally viable. The first option requires that the SEBs function like any other independent commercial enterprises, and are allowed to charge power tariffs as determined by cost. This would entail removal of explicit and implicit subsidies, and result in massive increases in the price of power to all consumers. However, there are problems with this option, quite independent of the obvious political difficulty of implementation. No developing country can really afford to allow such market determination of power tariffs because of the very large growth and welfare implications of such a strategy. The fact that such subsidies on power routinely benefit the richer groups (who are the greater consumers of electricity) more than the poor should not be allowed to detract from the role of power supply in the industrialisation and development process. In fact, differential pricing for different types of consumers (agricultural, industrial, etc) is a standard means of simultaneously promoting growth and distributional goals in all economies. And therefore the provisioning and pricing of electricity has to be part of broader social goals which can,ultimately, only be politically determined.

The second option - that of ensuring fiscal viability - requires accepting that a certain level of subsidy to electricity consumers is either socially desirable or politically necessary. This hard-headed acceptance in turn implies that matching funds for this subsidy have to be found in current revenues of the government, through more tax receipts or some other means. The associated 'losses' of SEBs would then have to be viewed not as indicators of inefficient functioning, but as the result of politico-economic decisions about access to electricity as a service. Of course, this need not vitiate the continuing search for cheaper and better sources of power generation or the need for greater conservation and more rationalised distribution which would minimise transmission losses. However, it would ensure that investment requirements of the SEBs would be met as part of the government's duty in providing basic infrastructural services, and resources for such investment would have to be raised as routinely and automatically as the money for defence spending appears to be found. It seems that the GOI has already implicitly accepted this principle when it agrees to provide guarantees to foreign investors for their expansion of power generation capacity. Yet the more logical course would be for the government to actually provide such guarantees and safeguards to the SEBs and then allow them to negotiate for the cheapest source of investible funds, rather than continuously berate them for their poor financial performance.

COMMENTARY

Enron: The Drama Continues

P Purkayastha

The Enron fiasco has brought out the pitfalls in the current path of power development in the country. The high rate of return, the incentive to inflate project costs and use of imported fuels are all common to most of the power projects being considered with private investment. If the current policies are not viable, what should be the core of the alternative ones? And what should be the regulatory regime that needs to be put in place?

THE Dabhol project of Enron now stands repudiated with the acceptance of the Munde Commitee Report by the Maharashtra government. The people of Maharashtra deserve all credit for this, as it was their continued struggle that kept up the pressure on this ruinous project. The significant difference between the Dabhol case and the other seven 'fast track' projects is that the people of Maharashtra put up a resistance. Unfortunately, other states have shown little response to the burdens being imposed on them through Power Purchase Agreements (PPAs) that are equally one-sided.

The 26th report of the Standing Committee of Parliament on Energy and the Munde Committee Report both have substantiated what the critics have held all along – the cost of the project is too high and the delivered cost of power would impose heavy losses on the Maharashtra Electricity Board. With the guaranteed 90 per cent withdrawal from Enron's Dabhol plant, MSEB would have to back down its own cheaper generation. Further, the tariff being dominated in dollars and the import of diesel/LNG exposed the Indian economy to heavy outflows.

The award of the Dabhol contract as well as its cancellation both raise a number of questions that are important for transacting future business as a nation. The award of the Dabhol project to Enron was in pursuance of a policy that was fundamentally flawed. Clearly, a policy as important as power cannot be decided by a few bureaucrats in the Department of Power who lack an elementary knowledge of the sector. Not surprisingly, such policy exercises descend to mere sycophancy. A bad policy is difficult to implement – this the current fiasco of the fast track projects has shown. This should be a salutary lesson for all concerned, both policy-makers with their own agenda and hungry multinationals, willing to wheel and deal their way into sweetheart deals.

The cancellation of the project by the Maharashtra government also raises important questions. The BJP-Shiv Sena alliance had made a campaign promise to cancel Dabhol and their leaders had clearly indicated in private the importance of fulfilling this pledge, if they were to make anything out of their anti-corruption campaign plank for 1996. Presumably, they had been well briefed on the Dabhol project, otherwise their campaign promise must be considered irresponsible.

The Munde Committee Report and chief minister Manohar Joshi's statement in the assembly do not appear to contain any new material. It does seem that the grounds on which the Maharashtra government took its decision were all in the public domain, once the Dabhol PPA had become public.

With all this, it is strange then that the Maharashtra government allowed Enron to continue its construction activities and thereby boost its compensation claims. A much simpler course would have been to declare a moratorium on construction during the period of review. Enron initially had claimed that they had spent only $ 100 million when the new Maharashtra government took over and began its review. Enron has spent this entire period of review in bringing in its equity early and awarding contracts to a large number of contractors with an eye to filing large cancellation claims. This game plan was facilitated by the extension of the review period as they got more time to pad their termination claims. The claim now stands at $ 300 million, an increase of $ 200 million, entirely due to the additional time granted to Enron. A moratorium on construction would have capped the termination claims within the $ 100 million Enron had stated that it had spent till then.

The cancellation of the contract has undoubtedly won BJP the political high ground in its battle for the 1996 Lok Sabha. And the cancellation under clause 17.2 still allows the state government to reach a negotiated settlement with Enron in about six months' time when the Lok Sabha elections are over. That way, BJP can have its cake and eat it too. The Dabhol project could stay in suspended animation, while the Lok Sabha elections are fought on the basis of its cancellation. No wonder the Maharashtra government has now gone on record that while the first stage of Dabhol has been repudiated and the second stage cancelled, MSEB has not been instructed to cancel the Power Purchase Agreement. Obviously, there is more to it than meets the eye on *l'affaire* Enron.

Perhaps this explains BJP's strategy of allowing Enron to go ahead with construction while reviewing the project.. The large compensation claim would justify a negotiated settlement later while delaying the review brought it closer to the Lok Sabha elections thus maximising the impact of the cancellation. That BJP is not looking at the policy issues involved is clear from its attitude to other fast track projects. While the Left and JD (minus Deva Gowda) have asked for a review of all the fast track projects, BJP has raised only the issue of Cogentrix. They are silent on the Gujarat Torrent project, also one of the fast track areas and currently under attack. GE, one of the manufacturers, has already complained that even though their bid was Rs 400 crore less than that of Siemens for the EPC contract, this has not been accepted thereby artificially inflating the cost of the project. Obviously, the Dabhol project cancellation had more to do with immediate electoral arithmetic. The Dabhol case had become a major issue in the Konkan area and had been exposed by a number of reputed experts including three former chairmen of the Central Electricity Authority. The BJP was thus able to seize a readymade issue and use it to its advantage. Its Swadeshi credentials can be truly tested only when it responds to other such issues that have not yet become public campaigns. Otherwise, the Dabhol case is but another gimmick in BJP's cynical manipulation of public opinion.

The Enron fiasco, whatever be the final fate of the project, has shown that an ill conceived policy is difficult to implement, particularly if the people are conscious. The National Working Group on Power consisting of various experts including three former chairmen of the Central Electricity Authority had been critical of the government of India's power policies. N K P Salve, the union minister for power, and the mandarins in the power ministry contemptuously dismissed all earlier criticism of the policy as being "ideologically motivated". Reacting to the criticism, Salve even categorised the critics publicly as those who are "dead in the power sector". Unfortunately for Salve, the voice of the 'dead' proved more powerful. And that spelt doom for the policy.

The repercussion of Salve's failure to provide a viable policy for expanding the power sector is that the Indian power

programme now has a gaping hole. Power shortages will now dog the economy for the next decade. The Eighth Plan had envisaged at least 5,000-10,000 MW of private power. We will be lucky if we see even a tenth of this materialise. The Ninth Plan scenario is even more bleak. No advance action for the Ninth Plan is being taken as the power ministry expected the private sector to take on the mantle for expanding the power sector. With private investments in power in a logjam following Enron, the prospects of large-scale private investments in the Ninth Plan may not materialise. Meanwhile, the State Electricity Boards are continuing to lose heavily, their annual losses running at about Rs 8,000 crore currently.

The Eighth Plan power programme was supposedly for adding 33,000 MW. The slow pace of the programme makes it unlikely that we will add even 16,000 MW. While this will still mean an installed capacity of 86,000-89, 000 MW at the end of the Plan, this will fall far short of requirements if the system performance does not improve.

The power ministry's vision has been the simplistic one that the installed capacity has to expand in proportion to meet the future peak demand. As the government has no resources and the power sector cannot generate adequate internal resources, what A K N Reddy, one of our leading energy planners, terms as the "mendicant's approach" – go begging all over the world for private investments – was adopted. And if the response is not forthcoming, offer more and more concessions.

The final package of concessions was such that the internal rate of return on equity, the basic investment parameter in business, was in the range of 30-32 per cent. This may be contrasted with the staid 11-14 per cent that these companies can earn on their home beat. No wonder, the chairman of British Gas said at the company's annual general meeting that British Gas had to go to unregulated markets to earn bigger margins—echoes of 'If you want to make your fortune, go east, young man' from an earlier era.

It is true that the Enron case had some deviations from the two-part tariff formulations of the current policy. However, the high rate of return, incentive to inflate project costs and use of imported fuels are all common to most of the projects being considered with private investments. The Cogentrix case in Karnataka has already been brought to public notice. In the case of the Visakhapatnam project of the Hindujas and Enron's Dabhol project, the Parliamentary Standing Committee on Energy (26th Report) found that there was clear evidence of cost padding. In the case of the Neyveli 'Zero' Unit, the Standing Committee uncovered that the whole project passed into private hands in a mere four days. It is also a project with the exceptionally high cost of Rs 5.5 crore per MW.

If the current policies are not viable, what should be the core of the alternative ones? And what should be the regulatory regime that needs to be followed? On the supply side, the major thrust should be for renovations and modernisation of the existing capacity. D V Kapoor, a former chairman of NTPC, has suggested that with an expenditure of less than a crore per MW, 7,000 to 10,000 MW can be generated additionally from existing power stations. Strengthening inter-state tie lines for transferring power from surplus to deficit areas can provide another 8,000 to 10,000 MW. If some of these measures are taken, the existing peak to installed capacity ratio will change from the pathetic 60-62 per cent it now is to about 70-75 per cent. Even then, these figures are lower than the global averages. It makes little sense to plough huge resources into adding to generation if full potential of the existing capacity is not first made use of.

This will still leave a gap between the future demand and the installed capacity that will have to be bridged by new investments. The new investments can be either through the state or the private sources or a combination of both. However, unlike any other industry, the electricity supply industry has two important characteristics. The withdrawal of power must match the supply at all instants of time as electrical energy cannot be stored. Further, the distribution of electricity is always a monopoly as the distribution lines cannot be duplicated. Therefore, any induction of private investments must take place within a strong regulatory framework so as to ensure grid discipline and a fair deal to the consumer. Unfortunately, there is no evidence that the government is even thinking about an appropriate regulatory regime. Even the meagre powers of the Central Electricity Authority are being whittled down with the World Bank reportedly recommending that it close shop.

This brings out the significant omission in the current debate. If the Electricity Boards and the powers that be decide to have sweetheart deals with private power generators by agreeing to high cost power, there is no agency to protect the consumers' interest. A high cost power regime benefits the private investors who are putting up the plants, the equipment manufacturers who can gold plate their equipment and those in power who decide the cost that the Electricity Boards will pay for the electricity produced. The only losers are the consumers, who have to buy power at whatever cost the Boards decide. Therefore any scheme of large-scale private generation must be preceded by the setting up of a strong regulatory structure. UK set up the regulatory structure before restructuring and privatisation of its electric supply industry. Here, instead of a competitive regime, we have the continuation of

'BOOKS THAT MATTER'

SATELLITE INVASION OF INDIA

S.C. BHATT

The first book of its kind on a hotly debated issue of much public interest, it traces the growth of TV in India and the rise of cable operators who have also brought satellite TV to Indian homes. The book explodes a few myths and puts all aspects of the question in perspective.

GYAN BOOKS PVT. LTD.

the licence-permit raj with the inclusion now of foreign power investors in the scheme of things.

The Enron fiasco has brought out the pitfalls in the current path of power development in the country. It is time that we take quick remedial measures before the power situation gets completely out of hand. The need is for a package of reforms that restore health to the State Electricity Boards and work out means for the least cost expansion of the power sector. India will do well to learn from the South Korean experience. The South Koreans have expanded the state sector for providing basic infrastructure like power and telecom while looking to the market for other areas. Instead of working out our distinctive path of development appropriate to our stage of development, the government is substituting slogans for policy. Unless this is reversed and hard thinking goes into working out concrete alternatives, the future of the power sector looks bleak.

V M Dandekar

A Vaidyanathan

A good bit of V M Dandekar's writings, being aimed at provoking wider public debate on politically charged issues, tended to be polemical. But this reflected the activist side of him – his view that knowledge was not merely a matter of scholarship but was meant to be used to educate and clarify issues to the public at large to facilitate better informed debate and decision-making. To this end he was willing to devote much time and effort to participate in official committees, non-official forums and the media.

VINAYAK MAHADEO DANDEKAR, distinguished economist and respected public figure, passed away in Pune after a brief illness on July 31. Born in 1920, he belonged to the generation which grew up at the height of the independence movement. Its ideals and ethos left an indelible imprint on his personal, professional and public life. His personal lifestyle was simple. He wore khadi most of the time, but in a natural unpretentious way.

As a professional economist he was throughout preoccupied with the basic problems of Indian society, namely, poverty, unemployment and inequality. While insisting on and maintaining high academic standards, he actively participated in, and often stirred, debates on a variety of important and practical policy issues in professional journals, in the media and public forums.

After taking a Master's degree in statistics from the Indian Statistical Institute, Dandekar joined the Gokhale Institute in 1945 and worked there till his retirement in 1980. He was director of the Institute for 10 years. His earliest writings dealt with problems of national income estimation in economies where non-market activities played an important role. Around that time (the late 1940s) the report of the National Income Committee had stimulated considerable interest in the potential use of household sample surveys to fill in major data-gaps, especially on the household economy. This led P C Mahalanobis at the Indian Statistical Institute to undertake a national household sample survey. Dandekar organised a similar survey in the Gokhale Institute using significantly different concepts, design and methods. He wrote two monographs discussing the methodology and the results of what came to be known as the Poona schedules. The relative merits of the two approaches were the subject of intense controversy between the two groups. But unfortunately the full potential for learning from the experience of these surveys through open, scholarly debate was not exploited. In the event, the government of India decided to entrust the responsibility for organising and conducting national sample surveys on a continuing basis to the ISI. In 1970, after NSSO was constituted into an autonomous organisation under the aegis of the government, Dandekar was made its chairman. He held this position for 10 years and made several innovative changes including the publication of *Sarvekshana* for disseminating the data more widely.

Land reforms, poverty and unemployment and agriculture were other themes on which Dandekar worked and wrote throughout the last four decades. Following a definitive study of the working of the Bombay Tenancy Act in 1957, he wrote several papers dealing with the wider Indian experience with land reforms and about the role of land reforms in agricultural development. His views on the subject changed radically over the years and in recent years he was arguing vigorously against restrictions on tenancy and [illegible] on landholdings. The effective use of modern technology, he felt, required certain minimum size of holdings and the need was to set a floor on holding-size rather than a ceiling. On poverty and unemployment, his joint monograph with Nilkant Rath titled *Poverty in India* has justly been hailed as a pioneering work. While the definition of the poverty line and estimates of poverty incidence had been written about and discussed by several scholars in the late 1960s and early 1970s, the Dandekar-Rath monograph was by far the most thorough discussion of the potential and the problems of public works strategies to increase employment and incomes of the rural poor. But he had been thinking about this problem much earlier; he published a monograph on the use of food surpluses in development as far back as 1956 and wrote a couple of papers on rural employment in the early 1960s.

He wrote extensively on various aspects of agriculture including regional variations in agriculture, agricultural pricing policy, crop insurance and the cattle problem. On the last-mentioned subject he stirred up an intense controversy: characteristically, he started a vigorous campaign in public for legalisation of cow slaughter at the height of a political agitation seeking its ban! He was impatient with, and dismissive of, those who focused on the economic and cultural rationale for Indian attitudes to cattle. He saw excessive numbers as the main reason for low productivity and advocated legalisation of cow slaughter as the remedy.

A good bit of Dandekar's writings – on subjects like cattle, agriculture pricing, role of trade unions, irrigation – being aimed at provoking wider public debate on politically-charged issues, tended to be polemical, perhaps to a more-than-necessary degree. But it reflects the activist side of Dandekar; his view that knowledge is not merely a matter of scholarship but is meant to be used to educate and clarify issues to the public at large to facilitate better informed debate and decision-making on important issues. To this end he was willing to devote much time and effort to participate in official committees, non-government forums and the media.

He was member of several official committees and chaired some of them, notable among them being those concerned with agricultural taxation, tax measures to promote employment, review of implementation of land reform laws, review of LIC and regional imbalances in Maharashtra. He made it a point to interact with politicians and public figures from the national down to the local level. He used to travel extensively in Maharashtra discussing and lecturing about live, and often controversial, local and national issues to MLAs, MPs, zilla parishad members and co-operatives.

Eventually he sought to institutionalise this process by setting up, in 1970, the Indian Institute of Political Economy. In its early days, while located at Lonavla, the Institute was the venue of several meetings, seminars and training camps for local leaders. Subsequently Dandekar started editing a new journal, *Journal of the Indian School of Political Economy*, its distinctive features being that it entertained relatively long, well researched papers on various aspects of the Indian economy, providing historical reviews of the evolution of policy in select areas and publishing texts of important documents and committee reports. He devoted a great deal of time and meticulous effort in securing, reviewing and editing articles for the journal. The venture has been a resounding success and ranks among his important achievements.

He was always outspoken, sharp and never shy of controversy. Concerned about maintaining high academic standards, his interventions in seminars and professional journals were particularly critical and provocative. His forceful and often aggressive style of disputation was unusual in the Indian academic tradition, and may not have been to everyone's liking. Some young scholars still struggling to find their feet may have felt overawed. But there was no malice in him. He could take punches as hard as he gave and was willing to concede points after heated argument. His interventions invariably helped sharpen the issues under debate. And he was always listened to with respect.

Dandekar's stature among Indian economists is evident from the fact that he was elected to preside over the annual conference of practically all the national associations of economists — a distinction which few others have achieved. In 1985 he was elected president of the Indian Society of Agricultural Economists (to succeed M L Dantwala) and held that office for a decade. His dedication and the widespread respect and trust he commanded in the profession enabled him to ensure smooth functioning of the society and maintaining high professional standards.

His passing also means a personal loss to his numerous friends. I met him in the early 1960s when he used to visit Yojana Bhavan regularly and join the lunch 'addas' in the ISI. His dignified, sage-like appearance, proud bearing and intense, luminous and mischievous eyes made a strong and indelible impression from the beginning. Initially his reputation as a scholar and critic made for a sense of awe and caution in relating to him. But over the years as we worked together, disagreed and argued (sometimes vehemently) about diverse subjects, our friendship developed and grew. And with it my fondness and respect for him. I, and his other friends, will miss his warmth, hospitality and enjoyable companionship.

Lal Bahadur Shastri National Academy of Administration

SITUATION VACANT

RESEARCH ASSOCIATE

PAY Rs. 5,000 per month consolidated.

Duration of Employment : One Year on purely temporary basis.

QUALIFICATIONS:

At least a Bachelors Degree in Social Science from a Recognised University with minimum of two years experience in the field work and data analysis through computer. Previous experience in the area of Socio-Economic Studies and knowledge of computer programming in dBASE/Foxbase, is essential.

STENOGRAPHER-CUM-COMPUTER OPERATOR

PAY Rs. 3000/- per month consolidated.

Duration of Employment : One Year on purely temporary basis.

QUALIFICATIONS:

Bachelors degree in any discipline from a recognised University with one year experience as Stenographer (English). The candidate must be well versed with computer operation and knowledge of at least one Word Processing Package is essential.

Applications on plain papers giving full details of qualification and experience may be sent to the undersigned as to reach us by 5th September 1995.

Professor Brij Pal Singh
Coordinator Village, Study Unit
LBSNAA, Mussoorie - 248179.

INVITATION TO AUTHORS AND EDITORS

We are pleased to announce the establishment of the "Spell Bound Publications Pvt. Ltd," at Rohtak – a city situated in the National Capital Region of India – about 50 miles from New Delhi.

The Spell Bound Publications has a target to emerge as one of the world's premiere social science publishers. The reference programme we are launching this year will provide a major service to the whole social science community. This is reflected in the launching of the publications primarily in the following areas:

Business Economics	Environment	Politics
Business Management	Gender Studies	Psychology
Commerce	Geography	Public Administration
Development Studies	History	Rural Development
Economics	Law	Sociology
Education	Philosophy	

Ranging from student texts to monographs, our publications would combine specialist knowledge & expert opinion in areas of study which increasingly demand the world's attention. Throughout our ultimate aim would be to publish exciting & innovative work for the students, researchers & practitioners.

Authors/Editors are invited to write to us.

Spell Bound Publications Pvt. Ltd.
Post Box - 91
Rohtak–124 001 (INDIA)

FACULTY APPOINTMENTS

Entrepreneurship Development Institute of India (EDI)

This national resource Institute, known internationally and engaged in entrepreneurship development through education, research, training and consulting, offers faculty positions in :

(i) Entrepreneurial Environment; (ii) Business Strategy; (iii) Finance; (iv) International Business; (v) Marketing; (vi) Technology Selection and Transfer; (vii) Behavioural Sciences; (viii) Entrepreneurship training; (ix) Woman Entrepreneurship and (x) Micro-Enterprise Development.

Qualifications : Post-Graduate degree/diploma in relevant field with consistently good academic record; backed by experience in academic institutions, industry, business, financial institutions, NGOs or consulting firms. Ph. D. for senior positions preferred.

EDI offers stimulating working environment, attractive financial package and excellent growth prospects.

Please send detailed bio-data indicating areas of specialisation, interest and current and expected position and emoluments to the **Sr. Manager (P. & A.), Entrepreneurship Development Institute of India,** Ahmedabad, P.O. Chandkheda 382 424, Gujarat within 15 days. Fax : (079) 7864367, Telex : 6224 EDII IN. Nominations are welcome.

NEW FROM SAGE

FINANCIAL SYSTEMS, INNOVATIONS AND DEVELOPMENT

V V Bhatt

This is an important book which formulates an analytical framework that links financial innovations to the development process; presents an integrated account of different financial systems in a historical and comparative framework; and suggests both the desirable and the likely pattern of evolution of the financial system in different developing countries.

PUBLIC EXPENDITURE DECISION MAKING

The Indian Experience

Anuradha Basu

This is the first study of public expenditure decision making in India that makes use of the notion of procedural rationality. Instead of merely looking at and criticising the outcomes of expenditure decisions, this study analyses the effectiveness and rationale, if any, of the administrative procedures and rules used to arrive at these outcomes.

Atomic Holocaust, Memory and the War

Mark Selden

That American and Japanese leaders and the dominant media in both nations proffer to emphasise the heroism of their acts and the suffering and the humanity of their own people under wartime conditions is hardly surprising or unique. Yet this unwillingness to accept responsibility for crimes against humanity committed in the search for victory casts a long shadow over contemporary international relations and the prospects for a just peace.

THE commemoration of the 50th anniversary of the end of the second world war and the dawn of the nuclear era in the US and Japan makes clear that neither the leaders nor public opinion in these nations have yet to come to terms with the great moral-political issues posed by the conflict. In both nations, impressive bodies of scholarship have reinterpreted the war and the making of the postwar world. Their assessments of the human costs and crimes of war, the political and moral equations of victim and aggressor, the relationship between the end of the war and the subsequent structuring of global power relations in the nuclear era, and the responsibility for life and death that rests on the highest leaders of both nations, have nevertheless had little discernible influence on official statements and policy. Nor have they gained ascendancy in public opinion. That leaders and the dominant media in both nations prefer to emphasise the heroism of their acts and the suffering and the humanity of their own people under wartime conditions is hardly surprising or unique. Yet this unwillingness to accept responsibility for crimes against humanity committed in the search for victory casts a long shadow over contemporary international relations and the prospects for a just peace. The recent abortive efforts by prime minister Maruyama Tomiichi to gain support in the ruling coalition for a meaningful official apology for Japanese crimes against Asian peoples during the era of colonial rule and aggressive war speaks volumes about the continued refusal of the Japanese nation to come to terms with its past. It is a failure made all the more glaring in contrast with German actions to make amends in word and reparations to the victims of Nazi atrocities. This leaves officially unresolved Japanese responsibility for a range of issues including crimes against thousands of military forced prostitutes (so-called Comfort Women) from Korea, Taiwan, China, the Netherlands and other nations, the Rape of Nanking, the conduct of vivisection experiments in perfecting chemical and biological weapons, and the use of such weapons in China, and more generally the slaughter of millions of Asians in the course of Japan's colonial wars in the first half of the 20th century. This official position may be contrasted with the unremitting efforts by numerous citizens, including peace activists and historians, to critically assess the historical record and prevent the recurrence of war and particularly crimes of war.

Japan's legal position on the issues of war, peace and reparations is secure. Outstanding Japanese obligations toward Japan's Asian colonies and invaded nations were settled by treaties that provided for reparations or aid, or which specified that Japan would make no claims on assets that belonged to the Japanese state, Japanese enterprises or investors. It is rather in the moral realm, in the refusal of the Japanese state to accept responsibility for its wartime behaviour, that the ghosts of war continue to haunt Japanese and Asian peoples.

The battle over the atomic bomb exhibit at the Smithsonian Institution's National Air and Space Museum, which raged in the American media and reverberated in American politics for nearly two years, ended in July 1995 in the victory (a pyrrhic victory, however, as the following discussion suggests) of the Air Force Association, the American Legion and the new right. Those who sought a reasoned and humane reassessment of the sensitive issues surrounding the decision to drop the bombs on Hiroshima and Nagasaki and the global context surrounging the end of second world war were silenced and their patriotism impugned. In the end, the exhibit was gutted, leaving the 60-foot fuselage of the B-29 Superfortress Enola Gay that dropped the first atomic bomb on Hiroshima, killing an estimated 2,00,000 men, women and children as the sole display. Planned exhibits that were to have presented informed discussion of the decision to launch a nuclear attack, the choices and the human costs of alternative options, the relationship between the bomb and postwar US-Soviet confrontation and other critical issues were the objects of a media campaign of vilification in which truth and humanity were the main casualties. Discarded too was the plan to portray the human face of the world's only nuclear attack through photographs and exhibits highlighting the trials and tribulations of its victims.

"The primary goal of this exhibition," a summer 1993 planning document asserted, "will be to encourage visitors to undertake a thoughtful and balanced re-examination of these events in the light of political and military factors leading to the decision to drop the bomb, the human suffering experienced by the people of Hiroshima and Nagasaki and the long-term implications... in the light of the most recent scholarship." Within months, however, the 1,80,000-member Air Force Association had taken the lead in attacking the conception. The subsequent battle, fought out in the media and the Congress, highlighted the continued sensitivity of the issues half a century after Hiroshima, the power of military lobbies to frame the terms of the public debate, and the inability of scholars to make their voices heard once emotional issues are publicly framed in terms of patriotism versus an attack by 'revisionist' scholars on American heroes. Indeed, a pivotal assertion of the Air Force Association and its supporters was that only those who fought had a claim to history, and that historians presenting new or superior documentation were suspect. Typical of media handling of the issues was the presentation of the personal experience of US veterans like Grayford Payne, a 74-year-old survivor of the Bataan death march plus "three years, five months and 20 days" of starvation and slave labour in five Japanese prison camps, which was juxtaposed against the critical scholarship of historians. In an influential *Washington Post* story by Ken Ringle, Payne recalled a June 1945 note "posted in our camp" at Hanawa in northern Japan. "It was signed by Premier Hideki Tojo. And it said, 'The moment the first American soldier sets foot on the Japanese mainland, all prisoners of war will be shot.' And they meant it. I had not been a prisoner for 15 minutes before they bayoneted a 15-year old Filipino kid right next to me – a kid so innocent he scraped together this little dirt dam with his last bit of energy so he would not bleed on my uniform while he died." Informed of the exhibit's intentions to "address the significance, necessity and morality of the atomic bombings of Hiroshima and Nagasaki," Payne responded, "what is he saying? That the thousands of Japanese killed by those bombs were somehow worth more than the thousands of American prisoners in Japan? After all we'd been through? What about the women and children I saw bayoneted and buried alive.. by the Japanese in the Philippines? What about the hundreds of thousands of Chinese hacked to pieces in the Rape of Nanking?" Payne's perspective would come to be echoed in editorials and articles in the press. *The Wall Street Journal* for example commented that it "is the clear impression given by the Smithsonian that the American museum whose business it is to tell the nation's story is now in the hands of academics unable to view American history as anything other than a woeful catalogue of crimes and aggressions against the helpless peoples of the earth." In their attempt to examine the

totality of the wartime experience, including the record of Japanese atrocities, the historians would be pilloried in the press as traitors. The testimony of Payne and other soldiers and POWs on all sides is of course of great importance to anyone who would construct the historical record. Equally clearly, it is one among many voices on all sides of the conflict which must be heard and assessed from soldiers at the front to the highest levels of military and executive power. Yet the Air Force Association and the US press time and again presented the accounts of US veterans as the unchallengeable authority on the war, setting it off against the judgments of professional historians.

Two brief sentences in the first of five drafts planning the exhibit became the rallying cry of Air Force Association and other media and political critics, a mantra that would be ripped out of context and repeated to devastating effect in literally hundreds of press reports. "For most Americans, it was a war of vengeance. For most Japanese, it was a war to defend their unique culture against western imperialism." For *Washington Post* reporter Eugene Meyer, this was the essence of the decision of exhibit planners to choose "political correctness over historical accuracy." In an article that ignited the controversy nationally, Meyer quoted the charges of critics that "the exhibit as planned will portray the Japanese largely as suffering, even noble victims and the Americans as racist and ruthless fighters hell-bent on revenge for Pearl Harbour."

The draft text did nothing of the kind. The quoted passage in fact followed immediately on a discussion of Japan's 1931 occupation of Manchuria and 15-year war.

"Japanese expansionism was marked by naked aggression and extreme brutality. The slaughter of tens of thousands of Chinese in Nanking in 1937 shocked the world. Atrocities by Japanese troops included brutal mistreatment of civilians, forced labourers and prisoners of war, and biological experiments on human victims.

"In December 1941, Japan attacked US bases in Pearl Harbour, Hawaii, and launched other surprise assaults against allied territories in the Pacific. Thus began a wider conflict marked by extreme bitterness. For most Americans, this war was fundamentally different than the one waged against Germany and Italy – it was a war of vengeance. For most Japanese, it was a war to defend their unique culture against western imperialism." The preceding passage might be faulted for its failure to discuss the context of the decade long US-Japan conflict that constituted the background to Pearl Harbour. But in the media lynching of the exhibit and its organisers, the denunciation of Japan's brutal aggression was ignored and the vengeance passage was twisted into an alleged justification for Japanese aggression and an attack on US motives.

The killing of the exhibit meant the loss of an opportunity for public debate on the central moral and political issues posed by the US decision to drop nuclear bombs on Hiroshima and Nagasaki, on the end of the war and the start of postwar global conflicts. Recent American scholarship on these issues, while far from achieving consensus on the critical issues, has recast the discussion in fruitful ways.

* by focusing on the human victims of the bombs and not merely on hegemonic goals,
* by exploring the logic and limits of analogies between atomic holocaust and Nazi holocaust,
* by relating the logic of nuclear bombing to the preceding massive civilian bombing in the European and Japanese theatres;
* by clarifying the multiple options available to the Truman administration for ending the war in the summer of 1945, and their associated costs in terms of American and Japanese casualties,
* by investigating the significance of the bomb not only as the final act of second world war but as the opening act of the hegemonic struggles of the postwar era,
* and by exploring anew the consequences of US insistence on the unconditional surrender option prior to August 9 and its subsequent abandonment once the bombs had destroyed Hiroshima and Nagasaki.

The decision to cancel the original exhibit, a manifestation of the deep insecurity accompanying the decline of American power, thus marks a lost opportunity to reconsider the nature of the war and peace in the nuclear age.

The shell of an exhibit that is now on display has been restricted to the fuselage of the Enola Gay, a plaque, and a video. While short on word and analysis, the brief accompanying printed explanations constitute a paean to many of the superpatriot myths that have long coloured heroic accounts of the war while ignoring not only its tragic dimensions, but also its anti-fascist, anti-colonial, and internationalist aspects. The spare accompanying text instead cavalierly minimises the destruction of the nuclear bombing of Hiroshima and Nagasaki by speaking of "many tens of thousands of deaths" rather than the several hundred thousand deaths from nuclear bombing. It claims that "the use of the bombs led to the immediate surrender of Japan and made unnecessary the planned invasion of the Japanese home islands" with no reference to other critical factors in Japan's surrender such as the Soviet declaration of war and the US decision to ease the unconditional surrender provision after August 9. It strongly implies that leaflets were dropped on Hiroshima warning civilians to evacuate, when no such leaflets were dropped on either Hiroshima or Nagasaki. And in an accompanying video, Enola Gay pilot Paul Tibbets justifies the nuclear bombing of Hiroshima as "definitely a military objective" with no reference to the civilian population and an attack plan that sought the maximum destruction of human life.

As Kai Bird and Martin Sherwin sum up their evaluation of the exhibit for the Historians' Committee for Open Debate on Hiroshima, "The few words in the exhibit that attempt to provide some historical context for viewing the Enola Gay amount to a highly unbalanced and one sided presentation of a largely discredited postwar justification of the atomic bombings." Yet the malaise about the use of the bomb voiced as early as 1945 by Generals Eisenhower and Leahy as well as by many patriotic citizens will continue to surface regardless of attempts to suppress it.

Truth and morality have been the principal victims in the censorship of the Smithsonian exhibition.

NEW BOOK FROM

PUBLISHERS OF THE HUMANITIES NATURAL & SOCIAL SCIENCE

URBANIZATION IN GARHWAL HIMALAYA

A Geographical Interpretation

By

Surendra Singh

1995, 303p, maps, bib, index; 23x15cm

ISBN 81-85880-69-7 Rs.400.00

This book highlights the regional personality of the urbanization in Garhwal Himalaya by focusing the attention on different aspects of the towns through the representative case studies.

Nation-State in the Era of 'Globalisation'

Prabhat Patnaik

The current phase of capitalism is marked by the rise to dominance of financial or rentier interests and the fluidity of finance across national borders. This has undermined the 'control area' of nation-states and made all agendas of state intervention appear vacuous. This economic milieu, however, has had the effect of producing greater unity in the advanced capitalist world, but, as a dialectical counterpart of this, greater disunity in the third world with growing tendencies towards separatism, divisiveness and disintegration. Are we now doomed to this fate for ever or can we overcome it?

I

THE development of nationalism in the third world countries, as is well known, followed a very different trajectory from that in the advanced capitalist countries. In the latter it was a part of the process of the emergence of the bourgeois order in opposition to feudalism, while in the former it was a part of the anti-colonial struggle. The impact of colonialism, though it differed across countries, had on the whole been in the direction of transcending localism and unifying supra-local economic structures through the introduction of market relations. The struggle against colonialism, consequently, took the form of a national struggle in each instance in which people belonging to different tribes or linguistic communities participated. And the colonial powers in each instance attempted to break this emerging national unity by splitting people along tribal, religious and other such lines.

The *modus operandi* of this splitting was not just through political manipulation as happened for instance in Angola, South Africa and a host of other countries; an important part of this *modus operandi* was through the nurturing of a historiography that just denied the existence of any overarching national consciousness. The national struggle, the national movement were given a tribal or religious character; they were portrayed as being no more than the movement of the dominant tribe or the dominant religious group for the achievement of narrow sectional ends. It was this kind of historiography which Thomas Hodgkin was attacking in his account of the emergence of nationalism in colonial Africa[1]. But the important point is this: colonialism, while, on the one hand, it objectively created the condition for the coming into being of a national consciousness at a supra-tribal, supra-local and supra-religious level, on the other hand sought deliberately to subvert this very consciousness by using the same forces which it had objectively undermined.

We in India are much too familiar with this dialectics for me to dwell upon it in any detail. If the development of a pan-Indian national consciousness concurrently with the provincial (or local 'nationality') consciousness among the existing regional-linguistic groups' was an objective contribution of colonialism, the fracturing of this national consciousness through the promotion of a religious divide was equally a contribution of colonialism. This is not to say that the soil for this divide did not exist, but then as George Lukacs once remarked, even false consciousness must have an element of truth which does not in any way negate the fact of its being false consciousness (and hence capable of manipulation).

These national struggles brought into being a plethora of nation-states after decolonisation. The success of these national struggles however owed not a little to another phenomenon which was occurring at the same time, namely a deep disunity among the advanced capitalist countries, which were simultaneously the colonial powers, a disunity which Lenin had characterised as 'inter-imperialist rivalry'[2]. Inter-imperialist rivalry provided the space within which the anti-colonial national struggles could emerge, develop and come to fruition. It not only prevented a coherent and co-ordinated response from the colonial powers acting in unison, but, by virtue of its eruption into wars among the major capitalist powers, weakened all of them for a considerable length of time, even while emboldening the national anti-colonial movements and widening their horizons. These movements which often began as the feeble protests of a group of lawyers and other professionals for petitioning the colonial government for slight amelioration in the conditions of the colonised, developed into mass upsurges as the perception developed that the days of rule by colonial powers who were busy tearing each other's throats must be numbered.

But that is not all. Inter-imperialist rivalry underlay the profound and protracted economic crisis of the capitalist order during the inter-war years. The crisis was not caused by the fact of inter-imperialist rivalry. Different writers have emphasised different factors as being responsible for the crisis, and perhaps each of these factors had a contributory role[3]. But the fact remains that inter-imperialist rivalry played the role of accentuating the crisis. Capitalism requires an international leading power which can impose a degree of discipline among the capitalist countries. This was the role played by Britain, though with increasing difficulty, in what Hobsbawm calls the "long 19th century", i.e. until the first world war. The emergence of inter-imperialist rivalry not only undermined Britain's leadership, but in fact made any leadership impossible, and at the same time it also prevented any collusive action by the major capitalist countries acting in unison on the economic front. Capitalism consequently had no response to the crisis engulfing it, what is more, the disunity among the leading capitalist countries which made each one of them pursue 'beggar-my-neighbour' policies to get out of the Depression made the crisis much worse.

These economic developments had two very important implications for the third world. First, by pushing vast masses of the peasantry into debt and destitution they contributed greatly to a widening of the sweep of the national movement, which in any case was gathering momentum taking advantage of the 'space' provided by the fact of inter-imperialist rivalry. Secondly, since they entailed a breakdown of the international economy (exemplified for instance by the drying up of capital exports and the formation of trade blocs in the 1930s) the economic programme of the anti-colonial national movement got firmly committed to national economic development through planning, i.e. eschewed any strategy of getting tied to the international market forces. To be sure, for countries which had experienced decades of colonial exploitation through *inter alia* the colonial powers' use of the market forces, a severance of links with the world market dominated by these powers would have seemed to be a natural accompaniment of decolonisation. But the fact that this world market itself was disrupted must have provided an additional powerful reason. The third world nation-state with its *dirigiste* economic regime and its commitment to planning (of whatever description) was thus a natural outgrowth from the very same

context which favoured the growth of third world nationalism.

The any dispassionate observer of the world scene the period 1913-51 must have appeared as the last gasp of capitalism, and it is scarcely surprising that this perception constituted the cornerstone of the theory of the Leninist movement with its basic concept of the 'general crisis of capitalism'[5] and it is this period which witnessed the Bolshevik Revolution, the beginning of the process of decolonisation, the Chinese Revolution and, of course, the detachment of large parts of Europe from the capitalist orbit in the wake of the triumphant march of the Red Army to Berlin.

For my purposes however I would like to derive a general conclusion from the experience of this period, schematic though this may seem at first sight, namely, disunity in the first world promotes unity in the third world (unity in the sense of the strengthening of supra-local, supra-tribal, supra regional, and supra-religious loyalties and commitments) I do not see this link between disunity in the first world and unity in the third world as a mere happenstance: it is not as if the period we are talking about merely happened to witness a coincidence of disunity in the first world with unity in the third world. I believe there is a causal connection between the two which I have been trying to underscore. And this causal connection also operates in the reverse, namely, unity in the first world promotes disunity in the third world, as indeed we have been witnessing in the more recent period Let me turn to this period now

II

The post-war stabilisation and consolidation of capitalism has been a truly amazing phenomenon. Capitalism did not just climb out of the abyss into which it appeared to have sunk in the inter-war period. It experienced in its metropolitan base the most pronounced boom ever experienced in its history. The collapse of the extant socialist challenge to it is hardly surprising in the circumstances. How could a movement which was premised upon the concept of a 'general crisis of capitalism' cope theoretically with a reality where capitalism in its home base was experiencing its most pronounced boom? The old challenge in other words simply could not be sustained. At first sight in fact it may appear intriguing that the battle in its old form, i e, based on the old theoretical perceptions, could be carried on for so long into the post-war period. A part of the explanation lies in the fact that Leninism was, and remains to this date, the only *practical* theory of revolution, the only example, as Lukacs put it, of a theory which is so highly developed that it *bursts into praxis*[6]. But a part of the explanation lies elsewhere, and that is what concerns me here.

Within the post-war boom there were different phases Capitalism emerged from the war with once again an undisputed leader, the United States. The international monetary system was re-established under the US leadership through the Bretton Woods agreement, which sanctified the dollar as being as good as gold. While an ordered international monetary system, together with Keynesian demand management in the advanced capitalist economies, provided the context of the post-war boom, the uneven development engendered by this boom, as manifested in the rapid growth of the shattered economies of Germany and Japan, progressively undermined US hegemony When the Bretton Woods system collapsed in 1971, because the conflicts generated by this uneven development were accentuated greatly by the Vietnam war, it looked as if the capitalist world was once again moving into a phase of intensified inter-imperialist rivalry. In short, the idea of a 'general crisis of capitalism' unfolding itself along the lines of Lenin's prognostications still appeared valid, notwithstanding the pronounced boom of the 1950s and the 1960s, even as late as the beginning of the 1980s when the successive oil price hikes both confirmed the proposition about 'space' becoming available during periods of inter-imperialist rivalry and precipitated a massive slump[7].

It is only in the 1980s that a new kind of unity appeared among the capitalist powers. This was not the unity imposed by one leader, the discipline brought about by a state of 'super-imperialism'; it was unity through agreement among the major powers. This is not to say that there are no major conflicts among these powers; there are, but on a number of issues, especially issues relating to the third world, they stand together. And even on matters affecting themselves, e g, on the agricultural policy of GATT, they strike compromises rather than pushing conflict too far. And not surprisingly, despite the collapse of the Bretton Woods system, the international monetary system has continued to get along under the system of 'managed float' of currencies.

An associated development, together with this unity, has been a tremendous increase in the fluidity of finance across frontiers of countries. These two developments in my view are related. Fluidity of finance overcomes all national boundaries, while disunity or rivalry among the capitalist powers entails rivalry among them along national lines. To say this is not to claim that rivalry among capitalist powers has disappeared or that conflicts among the national capitals of the metropolitan powers have become non-existent; but since no capitalist power can cordon itself off in a world in which finance including by its own nationals across its own frontiers, this fact imposes limits upon the extent of conflict among them. Together with the emergence of the phenomenon of highly mobile international finance, the advanced capitalist countries have reached a new level of unity. This unity does not preclude crises; in fact a hallmark of the current situation is the exceedingly high levels of unemployment prevailing in the advanced capitalist world, which in my view is linked (for reasons we shall discuss later) to the emergence of highly mobile international finance. But this unity engendered by the internationalisation of finance succeeds in breaking down the national reclusiveness of the third world economies and forcing their integration into global financial and commodity markets.

It is this integration which results in the disunity of third world societies, a retrogression into regionalism, separatism and even secessionism. Since such separatism requires for its sustenance an alternative identity, different from the old national identity, it tends to be accompanied by religious or ethnic conflicts. In short, I wish to argue that phenomena which usually have been investigated entirely in cultural terms, or in terms relating to the 'superstructure' have economic roots as well. To examine these let us see what integration into the global economy actually means.

The justification usually advanced for integration into the global economy is that productive capital has become internationally mobile at long last. As is well known, throughout the history of capitalism the mobility of productive capital has remained confined to the advanced capitalist countries alone[8] The phenomenon of underdevelopment has arisen precisely because of this; the underdeveloped countries saw the penetration of metropolitan goods into their markets, precipitating deindustrialisation in their own economies, but, despite their low wages, failed to attract productive capital from the metropolis to become manufacturing centres themselves. Had they done so, then the gigantic unevenness or 'dualism' which find in the world economy, the split between the advanced and backward economies, would have disappeared long ago. This however did not happen: productive capital from the metropolis went to the temperate regions of white settlements, such as the US, Australia and Canada, but never came to the backward economies of the tropics. And now it is being said in defence of globalisation that things are changing, that if only the underdeveloped countries open their doors and create the appropriate climate of confidence, foreign capital would move in not just to capture their domestic market (which is of no benefit to them) but to loc

its production facilities on their soil (owing to their low wages) for meeting global demand. It is on the basis of this promise (which if it materialised would indeed be conducive to their economic advance) that the underdeveloped countries are being asked to open up their economies, dismantle barriers to the free flow of capital into and out of their economies, and roll back the state as far as possible from the arena of production (since excessive state presence in the sphere of production is supposed to be inimical for a variety of reasons to the creation of business confidence).

As a matter of fact however what has become genuinely mobile across countries is not productive capital but short-term finance in the form of 'hot money' which moves around from country to country in search of quick profits, especially in the form of speculative gains. Now, this form of capital mobility does not induce any economic growth in the recipient country: the foreign creditors are not interested in undertaking any productive ventures, no genuine entrepreneur would undertake any productive venture financed by short-term speculative funds (since the sudden withdrawal of such funds would leave him bankrupt), and the state in any case is not allowed to undertake much productive investment. As a result when 'hot money' flows in, it cannot be used for augmenting growth; and when it flows out, the strain on the balance of payments in any case prevents any growth. Of course if the 'hot money' inflows has been used for stimulating imports of consumption goods for the elite, then its flowing out is accompanied by a drastic squeeze on the living standards of the poor (for generating the requisite surplus for financing the outflow), by sharp cutbacks in whatever productive investment was occurring and by the transfer of national assets to foreign creditors 'for a song'. Mexico today provides a classic example of all this.

Thus globalisation, which is ushered in on the promise of higher growth, produces no such thing. On the other hand the stagnation, the unemployment, the impoverishment which it produces, together with the consequent increase in crime and violence (which further snuffs out whatever prospects had remained of productive capital inflow), leads to a break-up of the nation for at least three reasons which I discuss *seriatim*.

First, there is the 'secessionism of the rich'. If the growth prospects of the nation get tied to the degree of success in enticing direct foreign investment, then the richer regions feel that they would be better placed in this regard if they acted on their own, unencumbered by the burden of belonging to the same country as the poor, violent, crime-infested regions. It is noteworthy in this context that the three Baltic states, Lithuania, Latvia and Estonia, which were among the richest in the Soviet Union, were the first to secede from it. Likewise, it is Slovenia and Croatia, which were the richest of the Yugoslav republics, which were the first to secede from Yugoslavia. True, in all these cases there were very strong undercurrents of nationality consciousness in all these regions. But it can scarcely be denied that an important factor behind the surfacing of these undercurrents was the belief that more German investment would be forthcoming into these regions if they were on their own than if they were parts of larger wholes.

But the 'secessionism of the rich' is not confined to rich regions alone. Within the bureaucracy, within the intelligentsia, within the professionals, there is a division, a 'dualism', created between those who can 'network' successfully with the metropolis, and the others. The very stagnation of the economy, the very squeeze on the population means that those who can, attempt to 'network' with the metropolis, and by doing so become materially better placed compared to their more 'unfortunate' counterparts. In other words commitment to the nation is replaced and perhaps perforce replaced by a desire to ingratiate oneself to the dominant views, perceptions, opinions and orthodoxies prevalent in the metropolis. As a result, the rich (or at any rate the affluent), even when they do not physically escape or 'secede' from the country, effectively undertake a mental 'secession'. And since no country can function without an effective intelligentsia, a cadre of bureaucrats, a group of teachers, scientists, etc, this 'secession of the mind' has a totally debilitating effect on the country. If the nation does not break up, it continues to exist through the courtesy of the metropolis.

Secondly, at the other end of the spectrum, i e, among the poor too, there is a tendency for phenomena like separatism, secessionism, and communalism, etc, to take root. Unemployment, deindustrialisation and impoverishment, though their impact can be potentially radicalising, are more often conducive to the growth of separatist, and even fascist, tendencies. The cause of the persisting misery of the local population is often located in the presence of 'outsiders' in which case there emerges a separatist tendency. Sometimes a particular religious group, or a particular linguistic community, which is alleged to be more prosperous than the others, is singled out as being responsible for the economic predicament of the rest of the population, and that provides the excuse for organising pogroms against it. What is common to all such movements is the fact of a complete absence of any credible economic programme. Their blueprint for a better society starts and stops at organising attacks on 'outsiders' or on members of particular religious or linguistic communities. Even when the movement is openly secessionist, it is totally bereft of any conception of how to organise an alternative economic order. Indeed it often does not see the need for any such alternative conception, since the economic order is not even considered responsible for the economic plight of the people; it is only the 'outsiders' from other regions or religious or linguistic groups who with their malevolent designs are supposed to be responsible for this economic plight.

The third tendency which, notwithstanding superficial similarities, is quite distinct from this second one, is the tendency towards the emergence of religious fundamentalism. This has usually a populist, anti-consumerist and even an anti-imperialist thrust which is completely lacking in communalism or regional chauvinism. Fundamentalism of the kind I am talking about does represent a conscious reaction to the fall-out of globalisation in the form of privileged islands, the consumerism of the elite, and its subservience to the culture of the metropolis: but it represents a reactionary response. Its social and cultural programme is obscurantist, reactionary and invariably male-chauvinist (this last being a trait it shares with the second tendency); its economic programme is so patently absurd that in those exceptional situations where the fundamentalist forces become politically triumphant, this programme literally withers away; the initiative for organising the economy fairly soon passes into the hands of a bunch of 'pragmatists' not as a sequel to any fierce ideological struggle, but by virtue of the sheer vacuity of the original conceptions.

These tendencies are not watertight. All three in varying degrees appear in strength in a globalised economy. And whether looked at singly, or in terms of their conjoint outcome, their effect is to destroy the unity of the nation. They are the flip side of the globalisation coin and they support the proposition which I advanced earlier, namely, that unity in the advanced capitalist world goes hand in hand with disunity in the backward capitalist world in the sense of a fracturing of the totalising idea of a nation and the coming to the fore of divisive tendencies.

III

Let me now come to the nation-state which is my topic. Underlying this situation of unity in the advanced capitalist world and disunity in the backward capitalist world is an *emasculation of the nation-state everywhere*. The vortex of globalisation, of which financial globalisation is the most crucial aspect and which produces greater unity at one pole of the capitalist world, the metropolis, and greater divisions at the other

pole, the outlying region, also entails an undermining of the nation-state as it has existed. And this has had very profound implications.

Much has been said about the collapse of socialism in the recent years. As a matter of fact, however, it is not just socialism which has collapsed but literally every ideological-political tendency which emphasises the necessity of some form of intervention by a conscious agency for the improvement of the human condition. Together with the collapse of socialism, there has been a collapse of social democracy, of Keynesianism, of welfarism, and of third world 'planning'. And the reason for this collapse of *all* interventionist ideological trends lies in the fact that the scope for intervention today is so limited, the only agency capable of undertaking this intervention is the state, which necessarily means the nation-state, and this agency's capacity for intervention is greatly undermined by the fluidity of finance.

Let me elaborate. Any capacity to intervene presupposes that there must be a domain over which the intentions of the intervening agency, in this case the state, can be made to correspond approximately with the outcomes of its actions. I call this domain the 'control area' of the state, and my argument is that financial fluidity undermines this 'control area'. True, capitalism, even with state intervention, does not cease to be a spontaneous system, i e, the capacity of the capitalist state to bring about a correspondence between its intentions and the outcomes of its actions has severe absolute limits arising from the fact of social antagonisms underlying this system. But the point I am making is a different one. Financial fluidity undermines the capacity of the state to bring about an approximate correspondence between the intentions behind and the outcomes of its actions, even in those spheres where social antagonisms do not stand in the way of this correspondence. If finance can move in or move out in unpredictable quantities at any time, then whatever control the state has over the economy is clearly being undermined. It can try to achieve something, but an entirely different denouement may come to pass because the caprices of the international speculators dictated otherwise.

I believe that this problem, of the 'control area' being undermined, affected the socialist countries as well. Unless an economy hermetically seals itself to the outside world, it is afflicted by this problem, even if all kinds of controls are placed upon the foreign creditors and speculators, the nationals of the country itself would move funds around, and that too clandestinely if necessary through the repatriation or non-repatriation of export earnings, to exploit possible gains in any society where such gains are not frowned upon. In the erstwhile socialist countries, the very process of reforms created the conditions for them to be caught in the vortex of financial fluidity with all its attendant implications. In the case of the Soviet Union for example the economic disruptions of the late Gorbachov period became a veritable crisis leading to a collapse of the system because of the non-repatriation of export earnings by Soviet firms.

For capitalist countries the problem is self-evident. It is this undermining of the capacity of the state to intervene which has made all agendas based on the assumption of such intervention appear untenable. And this explains the collapse of all theoretical tendencies which give rise to such agendas.

If the fluidity of finance across countries undermines the possibility of an interventionist state, an important implication of this is the virtual stagnation in the capitalist world and the high levels of unemployment. No single country can expand the level of activity in its economy without giving rise to capital flight from it, which of course, would make its exchange rate plunge and its rate of inflation accelerate. On the other hand, all the advanced capitalist countries cannot conjointly plan a simultaneous expansion in their levels of activity, because, notwithstanding their unity, their circumstances are not identical, and any such joint thrust would push up raw material prices for speculative reasons and raise the rate of inflation, a phenomenon which is always opposed by financial (or rentier) interests[9]. Unemployment and recession on the other hand often suit their interests insofar as the balance of payments crises faced by the third world countries in such periods enable them to acquire third world assets 'for a song'. A moneylender after all does not always worry if his borrower's income is not growing; in fact often he may wish that it does not grow so that he can get hold of his assets! Exactly similar considerations hold at the international level.

To sum up, the current phase of capitalism is marked by the rise to dominance of financial or rentier interests, and the fluidity of finance across national boundaries. This has the effect of undermining the 'control area' of nation-states, of making all agendas of state intervention for improving the living conditions of the people appear vacuous, of precipitating stagnation and unemployment even in the metropolitan countries, and of prising open the third world economies for penetration not only of metropolitan goods, but even more importantly of metropolitan finance. This economic milieu however has the effect of producing greater unity in the advanced capitalist world (where there is talk even of supra-national states, as in Europe), but, as a dialectical counterpart of this, greater disunity in the third world, with tendencies towards separatism, divisiveness and disintegration acquiring prominence. The question which naturally arises is: are we now doomed to this fate for ever? Or can we overcome this fate?

IV

The possibility of the "joint exploitation of the world by internationally united finance capital" had been envisaged by Karl Kautsky, the eminent German theoretician of the Second International. Kautsky's position however had been attacked by Lenin who had argued that the pervasiveness of uneven development under capitalism made any agreement among the capitalist powers temporary, to be followed by intensified inter-imperialist rivalry as the terms of the old 'truce' are rendered obsolete by new configurations of strength[10].

In one sense the present debate is reminiscent of the Kautsky-Lenin controversy, but in another very important sense it is not. Both Kautsky and Lenin derived their concept of finance capital from the German context, and Lenin expressed this as representing a coalescence of banking and industrial capital. In other words the concept encompassed nationally-based, bank-controlled, industrially-operated gigantic blocs of capital which were either in truce or in conflict. The finance whose fluidity has been talked of above, however, simply consists of enormous sums of money being pushed here and there by rentiers and speculators, big and small. This finance therefore is a somewhat different animal from the finance capital that both Lenin and Kautsky had in mind. About this finance Hilferding's dictum that the nationalisation of half a dozen banks would be the end of finance capital is even less appropriate than it was to the finance capital of his time. On the other hand, notwithstanding this difference, the two general perspectives articulated by Kautsky and Lenin continue to be of abiding interest.

The question raised at the end of the last section can be decomposed into two separate questions: first, can we think in terms of some agency transcending the nation-state that can be invoked as the agency for intervention in this new era? Secondly, if we cannot, and the nation-state still remains the only possible agency for intervention on behalf of the people, then how can it ever revive, since by our own argument its capacity for intervention has got undermined?

The answers to these questions are difficult because they still remain hazy. They will emerge with clarity only in the course of time. Nonetheless one can hazard some guesses. I believe that in the context of the third world at any rate the possibility of the emergence of an agency beyond the nation-state as an agency for intervention in the interests of the people remains remote. What is more, if the nation-state is incapable of

intervention then any such agency too would be equally incapable of intervention. Enlarging merely the size of the agency would in no way contribute to the solution of the basic problem. On the other hand I do believe that the nation-state can and will revive as an agency for intervention

It is impossible to imagine that the levels of unemployment prevailing in the advanced capitalist world would become a perennial feature of metropolitan life without causing serious social disruptions And any attempt, no matter what its nature, to reduce the levels of unemployment would necessitate a revival of the nation-state, and controls over financial fluidity True, such attempts in the context of the advanced capitalist world could well come from the right, rather than from any radical quarters, in which case such a revival would have a very different complexion, entailing chauvinism and jingoism, from the welfarist and social democratic conceptions of the post-war era; and the tremendous spread of racialism and neo-fascism all over Europe may be a pointer in this direction. But no matter what the nature of the revival of the nation-state in the advanced capitalist countries, any such revival would once again create the space required for a similar revival of the nation-state in the third world This is not to say that one should welcome right-wing nationalism in the advanced capitalist world, or be indifferent between a radical revival of the nation-state and a chauvinistic revival, this is only to underscore the fact that it is impossible to visualise such a revival not occurring. If the world looks somewhat Kautskyite at the moment, that does not by any means signal the victory of the Kautskyite perspective in the debate between Lenin and Kautsky.

Besides, for us in the third world, it is not even the case that we have to sit quietly until the nation-state has been revived in the west. True, the scope for state intervention has been greatly reduced, but it has not disappeared altogether What is required is that the state has to take *the constraints of living in a world with financial fluidity into account in planning its intervention.* While I consider any emulation of the east Asian model in the rest of the third world neither desirable (since this entails a neo-mercantilist development strategy that is necessarily accompanied by a degree of authoritarianism which is unwelcome) nor feasible (since it is the product of a very specific domestic class configuration as well as international correlation of forces), east Asia does demonstrate in a way the possibility of successful state intervention in a contemporary world marked by financial fluidity.

In contexts such as ours if the nation is to remain united then the resuscitation of an agenda of development that entails conscious intervention by the nation-state in the interests of the people, as opposed to leaving economic development to be determined as a mere fall-out of the caprices of international speculators, is absolutely essential. This requires however an alternative class-alliance underlying the state, one that would both enforce accountability on the state as well as provide it with sufficient sinews to face up to the challenge of international finance which is out to undermine its capacity for intervention. The forging of such a class alliance, which would necessarily be centred around the working people including the peasantry, however is a matter for political praxis

Notes

[This is the text of the author's Zakir Husain memorial lecture delivered at Zakir Husain College, Delhi, in February 1995]

Statement of the Chairman, Mr. Nani A. Palkhivala

59th Annual General Meeting

at the Birla Matushri Sabhagar, 19, Sir Vithaldas Thackersey Marg, Bombay 400 020, on Wednesday, August 30, 1995, at 3.45 p.m.

In the last four years, India has advanced economically and witnessed virtually a rebirth of liberalization. But, politically and socially, we have suffered an equally marked regression.

Casteism is in the ascendant and has risen higher than ever before since we became free in 1947. Men far below the national average, in point of character, get elected on considerations of caste and creed, region and language. Casteism is the curse of India, even as tribalism is of Africa.

It has been my longstanding conviction that India has been paying the highest price ever paid by any country for democracy. This is the inevitable result of our total neglect to give value-based education to our people and to teach them the priceless ethics embodied in our ancient culture. The greatest crime of our government against our people has been the failure to impart education. Politicians have a vested interest in preserving illiterate and unthinking vote banks. According to a report of the World Bank, by the turn of the century India will have more illiterates than the rest of the world put together.

A few years ago, an International Conference on Modern Constitutions was held in Washington, D.C. The conclusion that emerged was that in 75 per cent of the countries which had authoritarian governments, the people originally welcomed dictatorship, though they afterwards rued the day when they lost their liberty.

Guns, goons and gold

Today the people of India associate democracy with guns, goons and gold. One of the most thoughtful remarks of De Tocqueville was that democracy throws mediocrity into power. But the situation becomes intolerable when democracy throws criminals into power.

According to the Chief Election Commissioner, 180 out of 425 legislators in Uttar Pradesh have criminal records. During the Bihar State elections this year, the local police said that 243 candidates had charges pending against them. Adult franchise as practised in India is the worst possible advertisement for its true virtues.

In a piece on India headed "Rascals Rule", *The Economist* refers to a member of the Bengal Assembly who has a criminal record and was at one time the "most wanted" man in Calcutta, but has today become most wanted in a different sense, as he is wooed by different political parties.

A French thinker, Jean-Francois-Revel, published a book a few years ago entitled, "How Democracies Perish", where his central thesis is that the real danger to democracy comes from within, from a refusal to face the facts. Revel says that "democracy may, after all, turn out to be a historical accident, a brief parenthesis that is closing before our eyes" Samuel Huntington, the Director of Harvard's Centre for International Affairs, concludes that "the limits of democratic development in the world may well have been reached".

Only the other day we observed the twentieth anniversary of the Emergency. It is necessary to recall that democracy can become so degraded and depraved that people may yearn for a change. The Indian people may lose their freedom again or, alternatively, the country may suffer disintegration. Needless to add, this is the exact opposite of what I wish; but it is a sad apprehension of what can happen if the present decline is allowed to continue.

The cement industry

The cement industry continues to attract high excise duty. Instead of granting the much needed relief by way of reduction in duty on a core commodity like cement, in the last Budget the government imposed a heavier burden of excise duty on the industry, while it granted relief to a number of other core and consumer goods industries.

The cement industry's capacity, in the organized sector, as on March 31, 1995, rose to 70.7 million tonnes. This meant an additional capacity of 5.44 million tonnes in 1994-95, with production totalling 58.34 million tonnes.

Infrastructure bottlenecks continued to plague the industry's performance with severe power cuts in Rajasthan, Himachal Pradesh, Andhra Pradesh and Madhya Pradesh. In addition, the curtailment in the availability of wagons reduced despatches by rail to a little over 265 lakh tonnes as against 285 lakh tonnes in 1993-94. Yet the industry managed to register a marginal increase in overall despatches of 7.53 per cent. Sizeable

quantities of cement were sent by road transport, thereby adding to freight costs which the producer had to bear

The Company's performance

Your Company has achieved an all-time high in profit after tax of Rs. 144.39 crore. This significant achievement has been the result of several well-channelized endeavours: higher capacity utilization, improved operational efficiency, better sales realizations, strict control on expenditure and working capital, despite major increases in the costs of coal, electricity, railway freight, etc.

Your Company s production for 1994-95 was the highest ever at 8 47 million tonnes as against 7 72 million tonnes in the previous year Capacity utilization registered another two per cent growth at 99 per cent over the last year at 97 per cent as against the overall industry capacity utilization of a little over 80 per cent

The plants at Madukkarai Chaibasa Jamul, Wadi Chanda and Gagal (old unit) recorded the highest ever clinker production The steady performance of the new one million tonne per annum plant at Gagal also contributed to the record production of cement by the Company during the year

The total sale of cement by your Company for 1994-95, including traded materials and exports, was at a record level of 9.85 million tonnes as against 8.67 million tonnes in the previous year – an increase of 13.6 per cent. Of this, sales of your Company's production were higher by 7.21 lakh tonnes, an increase of nine per cent over the last year. On the export front, the Company's performance of 2.25 lakh tonnes showed an increase of 14 per cent over 1993-94.

Your Company is endeavouring to promote the supply of cement in bulk and also to encourage extensive use of ready mix concrete (RMC) Your Company s experience as the sole supplier of RMC to the prestigious project of the Bharat Diamond Bourse in Bombay, has given it a head start in this new activity

Refractory business

One of your Company's major restructuring initiatives – converting its refractory activities into a profit centre – has yielded rich dividends. Within a short span of five years your Company's refractory business has grown from Rs. 18 crore to Rs. 110.7 crore in 1994-95.

Research and Consultancy Directorate (RCD)

The other strategic initiative undertaken by your Company – the setting up of the autonomous Research and Consultancy Directorate – also recorded a growth of 57 per cent generating an income of Rs 33 crore

The achievements and capabilities of RCD have been recognized by the Department of Scientific and Industrial Research (DSIR) of the Government of India, through the "National Award for Innovation in the field of New Materials"; and also by the Indian Chemical Manufacturers' Association's special citation for "New Product Development". In addition, the Association of Consulting Civil Engineers (India) has recognized the *Indian Concrete Journal* (published by RCD) as the best publication in its field.

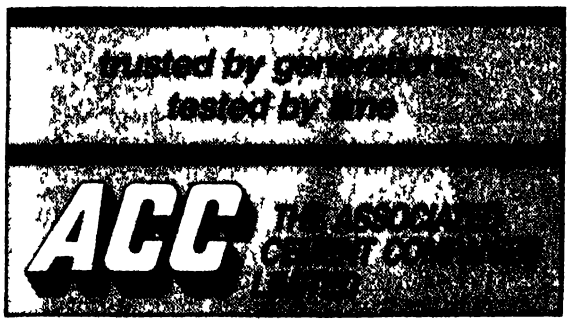
New projects

The new projects undertaken by your Company are dealt with adequately in the Directors' Report Among them, is your Company's Synthetic Ferric Oxide (SFO) plant which was commissioned at Falta West Bengal SFO is one of the principal raw materials in the production of hard and soft ferrites, used extensively in the electronics and telecommunications industries Over 70 per cent of the production will be exported

With the completion of the new major projects, your Company is now in a position to take on even more ambitious programmes in the unfolding future

The range of equipment manufactured at Associated Tyre Machinery Co Ltd (ATMC), now renamed ACC Machinery Co Ltd (AMCL), has been widened and includes among others equipment for Kellogg s cornflakes project at Taloja, and a turnkey job of a clinker grinding unit at Cochin which is nearing completion

Your Company's major venture with Floatglass India Ltd., was formally inaugurated in April 1995 at Taloja. Commercial production of clear float glass began in November 1994 and of tinted float glass in January this year.



Emerging scenario

The magnitude of recent developments will shape the future of industry beyond recognition As corporations strive to become innovation-fuelled there is a relentless search for better faster and more economic solutions to the problems facing technology-driven companies Your Company will always strive to remain a torchbearer in the business world, with the values of public spirit integrity and compassion

I have no doubt that under the very able and far-seeing stewardship of Dr. Subrata Ganguly and his team of committed colleagues, your Company will continue to grow from strength to strength in the years to come.

On behalf of the shareholders, and on my own behalf, I would like to express my heartfelt gratitude to each and every employee who has played a significant role in shaping the fortunes of your Company in a spirit of cooperation and goodwill

Bombay, July 27, 1995

REVIEW ARTICLE

Subaltern and Bhadralok Studies

Ramachandra Guha

Subaltern Studies VIII: Essays in Honour of Ranajit Guha edited by David Arnold and David Hardiman; Oxford University Press, New Delhi, 1994; pp 240, Rs 340

Event, Memory, Metaphor: Chauri Chaura, 1922-1992 by Shahid Amin; Oxford University Press, New Delhi, 1995; pp 256, Rs 345.

VOLUME Eight of *Subaltern Studies* begins with an essay by Partha Chatterjee on the evolution of modern historiography in Bengal. Chatterjee starts with an early 19th century text by Mritunjay Vidyalankar, a 'Puranic history' in which "myth, history and the contemporary all become part of the same chronological sequence". He then examines a series of later texts, which bear the imprint of the modern historical consciousness. These histories (by Iswar Chandra Vidyasagar and others) accept the European mode of historical consciousness, but not their interpretation of events. Here is the 'first generation' of (Hindu) nationalist history, which explains the rise of British rule in terms of betrayal and deceit, its continuation in terms of the amorality of the rulers and the brutality of their justice. These histories were rich in speculation of what made British rule possible and sometimes of what might make it end. But where their attitude to European civilisation was distinctly two-edged, hostility towards colonialism coexisting with admiration for western institutions, Hindu historians were all marked by a conspicuous dislike of Islam. Muslims were represented in their histories as war-like, predatory and expansionist, the period of Islamic rule as a time of decline and degeneration (from the classical Hindu past). Chatterjee ends with some vignettes from Bengali Muslim historians, who argued that Hindus too had come to the sub-continent as invaders and refused to equate the history of Indian Islam with the reign of its most bigoted rulers.

Chatterjee's essay is learned and suggestive, yet its appearance in a volume marked 'Subaltern Studies' invites the charge of false advertising. The suspicion is confirmed by the second contribution to the volume, Dipesh Chakrabarty's study of debates on domesticity among the Bengali intelligentsia. His theme is an interesting one – how the personal/domestic came to be distinguished from the communal/public – but the analysis is carried out in prose of such wilful obscurity as to put off all but the most dogged reader. This for instance, is how he states the problem. "This essay is an effort to understand the many contradictory and heterodox moves through which the Bengali modern has negotiated this distinction in (re)constituting itself within a world-system fashioned by imperialism". His conclusion is equally impenetrable, to wit, that "the Bengali modern, implicated as it is in the structures and relationships of power that produce the social-justice narratives of the public sphere, is constituted by tensions that relate to each other asymptotically". The intervening argument, so far as it revealed itself to this reviewer, runs roughly as follows: The 'bhadralok' internalised, rather early on, a Victorian ideology of Improvement. This viewed physical and moral regeneration as a prologemona to national renewal. Within the home, they increasingly adopted European ideas of diet, hygiene, clothes and (especially) time. In training the discourse of improvement on the housewife, the problem for the male reformer was to educate women out of ignorance but not into immorality and defiance (the exchange, so to speak, of sarees for skirts). Thus "the most successful wife is she who combines education with skills in household tasks".

These two essays on the mind of the bhadralok do considerable epistemic violence to the idea of *Subaltern* Studies. With David Hardiman's contribution we are back on more firm terrain reassured that the goods the volume contains are not entirely spurious. Hardiman provides a richly detailed and closely argued history of the forests and forest people of the Dangs. He first reconstructs the precolonial economy and polity, with a focus on the distribution of power between the ruling Bhil chiefs, other Bhils, and non tribal Konkanas. The Konkana peasants practiced 'rab' cultivation in the valleys, fertilising their crops through the burning of forest debris. The Bhils, on the other hand, preferred to cut swiddens on the forest slopes. The two systems of cultivation complemented each other; both depended on an abundant forest cover. Hardiman suggests that the Dangis were not natural conservationists; for them the forests were eternal, they had "no consciousness that human beings could destroy this massive expanse of vegetation". This is an argument from silence, however, an almost positivistic reading of the existing sources. Anthropological and ethnobotanical evidence from other forest areas would suggest that the Dangis might very well have had an effective storehouse of knowledge with regard to the natural environment, putting this knowledge to effective and practical use.

The precolonial context sketched in, Hardiman moves on to the development, under the British, of a new regime of forest exploitation. By the 1830s, the British had established a system of indirect rule in the Dangs, with the chiefs reporting to a Bhil agent. The demand for wood for the navy and later, from the railways, led to a greater intervention in Bhil life. Under the threat of coercion, the chiefs were made to sign away their forests for a pittance, and the "power of the forest officials began gradually to eclipse that of the Bhil agents in the Dangs". Roads and tracks, the veins and arteries through which forest revenue flowed, also brought in other artefacts of the colonising mission – rest houses, schools, dispensaries and (eventually) American missionaries. Hardiman recounts, cogently and with care, the Dangi variant of what was to become an all-India pattern, the expansion of an authoritarian and insensitive system of state forestry, the victimisation of the previous owners of the forest, the episodic, heroic but ultimately foredoomed protests of the Bhils.

In his essay on the colonial prison, David Arnold suggests that this was no panopticon. The authorities had difficulties enforcing their writ (with regard to food and segregation, for example), and there was always space for resistance. Convict wardens, meanwhile, ran an alternate and informal system of power within the prison. Arnold also touches briefly on homosexual relations between prisoners, relations marked by love and envy as much as by brutality and violence.

While he departs from Michel Foucault in his emphasis on agency and protest, Arnold more closely follows the French historian in viewing the jail as a site for the production of state knowledge and the exercise of state power. The treatment of prisoners and their bodies varied widely by race and status, with Europeans and high castes allowed better food and exempted from forced labour. Unlike in Europe the priests were kept out, but the doctors were welcomed in. The prison afforded colonial medicine a unique opportunity to study the prisoner's body, to experiment with dietary practices and try out new drugs.

Arnold's essay effectively brings together his early work on the colonial police and his more recent studies of colonial medicine. One hopes this is a prelude to a full-fledged

monograph, which would bring the narrative down to the present. Thus he hints at major changes in the period of nationalist agitation (with its *jail bharo andolans*), but unfortunately does not elaborate on them. Again, he mentions a protest in April 1834 at Calcutta's Alipur Jail – "the most important penal institution in British India at that time" – apparently without being aware that this was the very site of major protests by naxalite prisoners more than a century later – jail breaks as well a struggle for access to 'bidis' and 'chittis' that some reckon to be the founding event of the democratic rights movement.

Gyanendra Pandey promises a "detailed discussion of Partition and its historiography" but in the event focuses on two articles (one very obscure) and two books that actually take the prelude to Partition rather than Partition and its consequences as their theme. Pandey argues that writings on Partition, with the exception only of the odd story and the odd memoir, have suppressed the suffering and violence by chronicling the triumphant coming into being of two nation-states. The texts chosen for critique are deemed complicit with the projects (singly or in combination) of History, Reason, Progress, Civilisation, Modernity, Discipline and the Nation-State – a reminder that whatever its other weaknesses, postmodernism has at least helped enlarge the intellectual's armoury of abuse (pity the poor Marxist, whose quiver contains but two arrows, marked 'class collaborator' and 'comprador' respectively). But to give a convincing account of itself, a historiographical critique must aim to be comprehensive. I am no expert in this field, but do know of two eyewitness accounts neglected by Pandey, Margaret Bourke-White's *Halfway to Freedom* and Penderel Moon's *Divide and Quit*, whose ambivalent titles would seem to suggest a more varied and nuanced field-of-force that he allows for. In any case, the writing of politically correct literature reviews seems a considerable waste of Pandey's skills as a historian.

II

The contents of this volume, like those of its immediate predecessor, seem to confirm a marked shift of emphasis in the project of Subaltern Studies. Over the years, most members of its editorial collective have moved from documenting subaltern dissent to dissecting elite discourse, from writing with (socialist) passion to following the (postmodernist) fashion. Intellectual history, reframed as 'discourse analysis', this is emphatically not subaltern studies. Let us call it Bhadralok Studies, or, in deference to the spirit of the times, *post-* subaltern studies.

This preoccupation with discourse is something of an intellectual cop-out, a retreat from the hard grind of social-historical research. Consider Partha Chatterjee's *The Nation and Its Fragments*, the first book-length study to come out of the post-subaltern studies project. "My concern in this book is with social agency", claims Chatterjee, but about the only time an agent acts is when Ramakrishna takes a carriage "all the way from Calcutta past Dakshineshwar to Belgharia" to meet Keshabchandra Sen. A work on Bengali intellectual life – in parts very well executed – is reinscribed (to problematise, for a moment, the book's subtitle) as the presentation of 'Colonial and PostColonial *Histories*'. To justify the plural, or even the singular, Chatterjee would have had to leave his desk for the field and the archive, the law court and the newspaper office, to reconstruct from fragments the history of the fragment. That would be history-as-craft; what we have, instead, is writing-desk history, the conceit that relations of power can be 'read off' printed texts.[2]

An extraordinary apology for writing-desk history has since been advanced by Gyan Prakash. Subalternity in this view resides not so much in the lived experience of women and workers, peasants and pastoralists, but as a "recalcitrant difference that arises not outside but inside elite discourses to exert pressure on forces and forms that subordinate it". This calls for a "complex and deep engagement with elite and canonical texts". According to Prakash, the project of subaltern studies has thus helped bring about the "relocation of subalternity in the operation of dominant discourses". Wonderful! Read James Mill and Jawaharlal Nehru, but to learn about the subaltern. It all makes it very easy for the historian.[3]

III

The key phrase in Shahid Amin's book *Event, Memory, Metaphor* occurs on page 118. "Disappointed in one archive", he writes, "it is the business of the historian to turn to another". Where some of his colleagues have abandoned the archive for the library, Amin's study underlines and reaffirms the original intention of subaltern studies: the recovery of the voice and memory of the subaltern. Through a wide array of published and unpublished sources, and the use of oral testimonies, he has produced a well-researched, well-crafted study of a suppressed event in the saga of Indian nationalism, the burning of the 'thana' in Chauri Chaura on February 4, 1922. This event led to Gandhi calling off the non-cooperation movement; as for the protesters themselves, they found themselves transformed, overnight, from volunteers to criminals, their act a dark blot on an otherwise blemishless saga of Indian nationalism.

Amin starts with the obligatory bashing of master narratives in general and the narrative of nationalism in particular. The narrative of his own book is deliberately disconnected, with short chapters and short shrift given to chronology. This seems a further, unnecessary concession to intellectual fashion, for perhaps a more conventional account would have made for more effective presentation. As one reads on, however, the logic of the book gradually unfolds itself, in five chronologically overlapping but thematically distinct parts.

Part I sets the context, the narrating the details of an event that has since been remembered "only in order to explain the termination of a particular phase of our Freedom Struggle". Part II provides a brief but thick description of Chauri Chaura and its environs, going over the social composition of the villages and towns, their ways of economy and exchange, their settlement patterns and means of communication. The book really gets going in Part III, where the historian juxtaposes, side by side, three versions of the event.

Version I is the nationalist narrative, which has had "no time for a history of the event, only for its lessons". The burning of the thana was a case of the (non-violent) Gandhi being betrayed by his (violent) followers: to quote the newspaper *Aaj*, the event showed that "our people have learnt inadequately the lesson of non-violence, that our people willingly take rogues for leaders, that violence and revenge are extracted in the most brutal ways". Gandhi himself, ruminating on the "tragedy of Chauri Chaura" saw it in much the same terms. "Non-violent non-co-operators", he remarked, "can only succeed when they have succeeded in attaining control over the hooligans of India, in other words, when the latter also have learnt patriotically or religiously to refrain from their violent activities at least while the campaign for non-cooperation is going on".

Version II, crafted some years later by the district historians of Gorakhpur, sought to cleanse the peasant-volunteers of the sin imputed to them by the nationalist narrative. In this account, the arsonists acted as they did only under extreme provocation and after enormous suffering. For two whole months, it is said, the police and the landlords "kept raining lathis at the satyagrahis". This unrelenting violence finally made the volunteers lose their nerve, in these circumstances, indeed, "even a saint would have lost his head".

Version III reveals itself in a letter written in 1938 by Dwarka Gossain, one of the volunteers jailed for life for his part in the 'outrage'. When the Congress governments came into office in 1937, they released all political prisoners, except only for those convicted after Chauri Chaura. Writing to the chief minister of the United Provinces, Govind Ballabh Pant, Dwarka penned what Amin calls "a formidable indictment of the Congress discourse on Chauri Chaura". Had the chief minister forgotten, he asked, that "whoever fought against imperialism and for swaraj, be he right or wrong, violent or non-violent [was in the right, for] the goal is the same".

The story moves on, in Part IV, to the trials of 1922-23 in which 19 volunteers were sentenced to death, with 110 others being

given life imprisonment. In my view this is the weakest part of the book: ponderous, heavy-handed, lacking the immediacy and intimacy of what comes before and after it. Amin elaborates here what seem to be fairly obvious points: namely, that the testimony of the approver, Shikari, and the verdict of the judge were both constructed narratives, tending to remove inconsistencies and ambiguities towards a smooth retelling of events which would facilitate the final judgment.

Part V, by moving back from text to context, provides a fitting end to the book. Here Amin charts the sometimes considerable distance "that separates the volunteers of Gandhi's Collected Works with the otiyars of [peasant] recollections". This is an account rich in paradox and contradiction. The 'otiyars' (the term by which the volunteers are remembered) wore clothes of colour (especially saffron), not the white khaddar that Gandhi insisted on. Peasant notions of swaraj were radically at odds with the nationalist dream: they "perceived of it as a millennium in which taxation would be limited to the collection of small cash contributions or dues in kind from fields and threshing floors, and [in] which the cultivators would hold their lands at little more than nominal rents". The descendants of the otiyars, meanwhile, recalled their forefathers' pride in their 'tough masculine bodies'; not for them an "androgynous Gandhian sense of sacrifice".

Amin found, to his surprise, that no stigma attached to the family of the approver, Shikari, whose testimony had sent some of his informants' relatives to their deaths and numerous others to long spells of incarceration. Some of his interviews, indeed, were conducted in the home of Shikari's son, himself a respected village 'pradhan'. He essays the interesting speculation that this tolerance and even affection for the memory of Shikari might be due to a tacit acceptance of nationalist guilt – the approver, after all, was merely following Gandhi's advice to the 'criminals' to turn themselves in. But the last word on official nationalism must rest with Naujadi, the wife of one the the 'rioters', Rameshwar Pasi. Standing in for the thousands of peasant nationalists who fought for swaraj but have since got little out of it, she remarked: "Everybody has got their raj, our raj never came. It's us who created the turmoil and look what we got – nothing!".

Amin writes that in the nationalist consciousness a 'nagative charge' has always attached itself to the 'crime of Chauri Chaura'. His own effort, in which he largely succeeds, is to free the otiyars from "the constraints of [colonial] law and nationalist condemnation". I wish though that his book was at least 50 pages longer. There are tantalising but undeveloped references to the rebellion of 1857-58, apparently very intense in these parts. One would have liked for a more extended discussion, in the context of the riot and its immediate prehistory, of the peasant rumours about Gandhi that he has written about elsewhere, and for a more careful identification of the biographies and motives of the district historians who tried to 'whitewash' the nationalist narrative. The book and its readers are also ill-served by a hopelessly inadequate index.

The real failure of the historian's imagination, however, is with regard to Mahatma Gandhi. Writing of the events of 1922-23, Amin refers to Gandhi with heavy but misplaced irony as the 'Father' of a nation still a quarter of a century in the making. He prefers an instrumental, almost cynical reading of the strategy of non-violence – at times reminiscent of R P Dutt – without allowing for the deep moral commitment which underlay it. An after-the-event comment by Gandhi is dubbed an 'authoritative' and 'celebrated' essay, much as if it darkly influenced generations of historical writing (when it seems to have been exhumed by Amin himself); Gandhi's prose is termed 'disciplinary', part of the 'discourse of discipline', although we are never informed as to whom, and by what means, his words helped 'discipline'. Amin quotes Gandhi as expressly allowing the eating of fish and meat, yet sneers, in the next sentence, at 'nationalist vegetarianism'. When Gandhi talks of his nervousness at being surrounded by a milling crowd (a very human response), the populist historian can only see the ungratefulness of the leader towards his flock.

Shahid Amin is unable or more likely unwilling to enter the mind of Mahatma Gandhi, but the mind of the peasant is another matter altogether. 'Can the Sabaltern *Speak*', asked a literary critic some years ago, wagging a threatening finger in front of the innocent historian. The answere, we can now report, is years, the subaltern *can* speak, but in Bhojpuri, not French.

Notes

1 These two essays mark a departure in more ways than one. Both have been published previously, Chatterjee's in *Social Research*, Chakrabarty's in *History Workshop*, and are reprinted here without acknowledgment. This is a practice so common nowadays that academics have coined a phrase for it – 'double dipping'. However, to recycle material in a project that prides itself on its originality is unappealing – that this is a festschrift for Ranajit Guha makes it doubly so.

2 Partha Chatterjee, *The Nation and Its Fragments: Colonial and Post Colonial Histories* (Princeton and New Delhi, 1993-94). (The claim about 'agency' appears on page 34, the description of Ramakrishna's carriage ride on page 43.) Chatterjee's theoretical and political emphasis is on the relationship between state and community, his main complaint that 'autonomous forms of imagination of the community were, and continue to be, swamped by the history of the postcolonial state' (page 11). But so much does he operate in the world of discourse that a book written in Calcutta in the 1990s does not so much as mention the fascinating, continuing and unresolved tension in the Bengali countryside, between the claims of the community and the claims of the state (over such distinctly subaltern and power-laden questions as access to land and forest, self-representation, and the limits of bureaucratic authority). The word panchayat does not appear in his index or, so far as I can tell, in his text.

The terms 'history-as-craft' and 'writing-desk history' were suggested to me by the social historian Hans Medick; they capture most clearly the difference in method between subaltern studies, properly so-called, and post-subaltern studies.

3 Gyan Prakash, 'Subaltern Studies as Postcolonial Criticism', *American Historical Review*, December 1994. The title of this essay rather gives the game away. For to see subaltern studies as a project of 'criticism' is already to privilege the reading of printed texts in the public domain (one can only criticise that which is presumed to be read). The prefix 'postcolonial' is more curious still, for practically all the essays in the eight volumes of subaltern studies have dealt with the years *before* 1947. Perhaps Prakash is here following postmodernism to its self-absorbed and egotistical end, where the birth certificate of the writer, rather than what he or she is writing about, is taken to b definitive.

Readings in
REVOLUTION AND ORGANIZATION : ROSA LUXEMBURG AND HER CRITICS

Lenin/Luxemburg/Trotsky/Stalin/Lukács

Selected and Introduced by

Sobhanlal Datta Gupta

. . . The value of the volume is that it gives texts from Rosa Luxemberg herself, together with those of Lenin, Trotsky, Stalin and the Hungarian Marxist, Lukács.
. . . whom he (Lenin) called "eagle of proletarian revolution".
". . . her biography and her complete works will serve as useful manuals for training. . ."

Colonialism and Environment in India

Comparative Perspective

Jacques Pouchepadass

Although colonial rule throughout the world was accompanied and supported by exploitation of forests and environmental destruction, independence has not put a stop anywhere to these processes. Rather, the disruption of the relationship between local societies and their natural resource bases has continued in the worldwide movement towards modernisation. Instead of contrasting this situation with a mythical golden age of equilibrium between society and nature, what is needed is a radical critique of capitalist expansionism, of which the colonisation of nature has been one of the major objectives.

CURRENT anxieties regarding our dwindling capital of biomass resources at the world level have brought to the fore the question of the relationship of rural societies with their forest environment. The social perception of nature has always been a central preoccupation of social anthropologists. But students of peasant societies have long considered the forest as of peripheral importance, probably simply because it was situated at the periphery of the cultivated space. Agrarian history, both western and non-western, has up to now largely been a study of techniques, yields, appropriation patterns, taxation, commercialisation, social stratification, peasant resistance. It has too rarely examined from a truly ecological standpoint the effects of land colonolisation, agricultural and animal husbandry practices, hunting and gathering by peasants, and the functioning and crises of agrosystems (except in the special case of famine). The opening chapters of many books of agrarian history are geographical presentations of the areas of study which convey the impression that the natural setting of agrarian life is a timeless framework of unchanging biophysical conditions. Any static conception of the relationship between human communities and their environment is of course misleading, as an agrosystem is usually the outcome of a long history of ecological disruptions and adaptations. As long as it functions, it necessarily remains in a state of dynamic and unstable equilibrium. In particular, the interrelationship between agriculture and its forest 'frontier' is often ignored in these studies, or treated marginally. As a rule, the agrarian historian has left the forests where they were, on the distant horizon, or as dark wild patches in the midst of the humanised artificial landscape of peasant life and activity. The origin of the word 'forest' is a late Latin word, 'foresta', most probably derived from the adverb 'foris', which means 'outside'.[1] In leaving the forest outside his purview, the agrarian historian in fact adopts the point of view of the state, or more accurately the point of view of his sources, that is to say official records, which relate mainly to the cultivated area, that which produces revenue.

The conception of the forest by the peasant himself was of course quite different. The accessible forest was a central element in the organisation of traditional agriculture, a sort of wooded extension of the cultivated space, often criss-crossed by pathways, and daily frequented by village people who came to graze cattle, to hunt, and to collect fuel, timber, litter, green manure, and all sorts of other vegetable produce which often constituted important adjuncts to their diet or to their sources of monetary income. Prompted by the current fears of an impending world ecological crisis and by the widespread indictment of thoughtless deforestation, the agrarian historian is now reversing his perspective, and forest history has been developing rapidly over the last few years.

My purpose here is to explore briefly the colonial phase of the history of Indian forests, and this in a comparative perspective. As everyone knows, it is in the tropical world that ecological devastation is most dramatic today. The biological wealth that is being destroyed here is both the most abundant and the most vital to the future of the human species. And it is here that its destruction seems most difficult to control. The forests of the tropical zone entered for the first time into a phase of common history at the world scale when they were all brought under more or less simultaneous attack during the age of the capitalist expansion of Europe. The phrase 'imperialism and the natural world' has become paradigmatic these last few years for a new and growing range of historical problems and research. The details of Indian forest history during this period are now being gradually unearthed from the forest records by historians. I would like to review these data in the light of current general views on this new apsect of the history of European expansion.

It is commonplace to say that, in the countries which underwent European colonisation, the colonial period normally represented a very important phase from the standpoint of the destruction of the natural environment. However, let us not be overly Eurocentric here. This phase of destruction was not the first in history. The desertification of Mesopotamia, the depletion of the cedar forests of Lebanon from the time of the Phoenicians, the massive fellings in Roman North Africa, the extensive hill clearings in the Southern Maya Lowlands of Mesoamerica, the ecological decline of the classic Khmer empire, the over-exploitation of forests and consequent energy crisis in Tokugawa Japan, the almost complete denudation of China for agriculture by its own peasantry, are only scattered dramatic examples of a general historical phenomenon, the gradual depletion of the world's forest cover for the needs of agricultural expansion and urban development. India, of course, has not been spared by this general trend, and evidence is not lacking, for instance, on the impressive rate of forest clearance throughout the Gangetic basin during the medieval period. Also, considering what followed it in many countries, the colonial phase of environmental disruption has not everywhere been the worst. But it undeniably set in motion processes (economic, demographic, social, administrative, legal) that stimulated the overuse of natural resources and have proved difficult to reverse. On the other hand, the colonial period was often marked, in the countries involved, by the inception of conservation policies, even though these policies reflected the needs of the state rather than any strong concern for the welfare of the local populations. The overall picture is thus dark, but not entirely black.

I
Colonial Factor in History of Environment

The historians of the 1960s waged a long war against the structuralist notion of 'societies without history' (or rather against the distinction which Levi-Strauss made

'cold' and 'hot' societies, which was in fact misunderstood, historicity being mistaken for history). A similar struggle might well have to be launched to combat the notion of 'nature without history'. There is, after all, a connection between the two notions. Societies without a history, in the common erroneous interpretation of the phrase, were believed to have remained outside the mainstream of history because of their total immersion in the unchanging rhythms of a natural environment which was thought to determine them completely. While historians have rightly refused such an idea, we must also reject the idea that colonisation everywhere struck the first blow against natural states of equilibrium which had remained intact since primordial times. The myth of primeval nature is found everywhere and at all times. In Europe, mediaevalists long thought that the massive clearings of the ninth to the 12th centuries had been done at the expense of forests which had been untouched until then, and they believed this on the basis of the mediaeval chronicles themselves. Now wherever precise archaeological enquiries have been carried out, they demonstrate that on the site of many of these medieval forests, there had been intensive human occupation during protohistorical or Roman times. Everywhere in the tropical world, for accidental reasons such as the construction of roads, remains of very ancient (not unfrequently neolithic) human occupation are found in the midst of supposedly virgin forests. Palynological and palaeobotanical studies of quaternary sediments within the dense forests of peninsular India show evidence of clearances and of the practice of agriculture from the beginning of our era. It is common knowledge that the terai forests of northern India contain innumerable remains of fortifications and shrines, of canals, of deserted village sites. We know, for instance, from the evidence of Chinese Buddhist pilgrims that the Gorakhpur forests were the site of flourishing towns before the fourth century, which lasted at least until the seventh century. In Sri Lanka, the forests of the dry zone, where by the beginning of the colonial period only groups of hunters and shifting cultivators remained, were actually not more than five or six centuries old. They had succeeded, after the 12th century, to a long phase of prosperous agriculture supported by a highly developed water-supply system. Vestiges of precolombian agricultural practices are found in the Mexican forests. Bantu expansion colonised many parts of the central African forest long before European colonisation. Historians have formed the hypothesis that the vast teak forests discovered by the Dutch in the centre and west of Java in the 17th century were the result of plantation carried out at the beginning of our era. In India, similarly, the 'jungle' was not unfrequently man-made, as when local kings planted forests or allowed their spontaneous regrowth in order to protect their territories against potential invaders: we have precise examples of this from Saurashtra for instance. One could go on indefinitely with examples of this kind. It must be noted, incidentally, that the western myth of the 'virgin forest' carried with it, in the colonial context, important legal and economic implications. Since by definition the untouched primordial forest belonged to no one, it seemed only logical that its control should vest in the colonial government.

Similarly, the societies which lived in and from the forest when the Europeans arrived were not isolated communities preserved from all outside influence from the beginnings of history. In India, the relationship between the forest tribes and the sedentary populations of the plains were constant and diversified, and the myths of the former show how deeply the latter formed part of their cultural universe. Many forest societies of the tropical world were in fact peoples from the plains who had been driven into the forest by force or had had to take refuge in them. Many societies of hunters-gatherers have been shown to be former societies of settled agriculturists who were at some point in time driven out of their habitat and forced into the forest where they adopted a different mode of subsistence, based on the natural resources of the forest. Godelier has interesting examples of this to offer from New Guinea and elsewhere.[2] Similarly, the nomadic herdsmen of Mongolia are not originally people of the wilderness, primitive hunters grown into pastoralists, but peasants who gave up the insecurity of dry-farming in a most difficult environment for a more reliable and, in their eyes, noble mode of subsistence.[3] Shifting cultivation, contrary to a widespread cliche, was in fact not necessarily associated with insulated and primitive ways of life. It was occasionally compatible with a market economy, with land ownership and taxation, and it has at times supported urbanised civilisations, such as that of the Mayas.[4] In addition, many products gathered in the tropical forests had been items of long distance trade long before the advent of the Europeans. So, western colonial expansion did not necessarily disturb or destroy primordial states of ecological equilibrium, nor any original harmony between societies and their natural environments. At best, it destabilised *relatively* stable situations, which were the last stage of long histories of successive disturbances and adaptations.

The nationalist myth of the precolonial golden age survives today in the oft-stated view that indigenous societies, before the advent of colonialism, were able to maintain a state of ecological homeostasis with their natural environment. They achieved this equilibrium, it is said, thanks to their immemorial knowledge of the natural world and to the innate wisdom of their self-managed local communities, which were spontaneously inclined to nature conservation, and practiced collective self-restraint in the utilisation of its resources. There is no denying, of course, the marvels of ethnoscience, but such pronouncements imply more dubious value judgments which have unfortunate implications. They in fact resuscitate the Eurocentric narrative according to which the history of the non-western world was set in motion by the disruptive impact of western expansion (beginning with the 'Great Discoveries' of the late 15th century). They implicitly postulate that the access to natural resources was equally open to all, and ignore the facts of power and inequality in the structure and functioning of precolonial societies. They give a new span of life to the old opposition between tradition and modernity, an ideological construct which was believed to have foundered with modernisation theories. They seem to disregard the evident material fact that the collective preservation of a natural resource base requires no particular ecological ethos as long as population density remains low, and that it is the scarcity and overuse of available resources that generates the impulse towards conservation. They also do not raise the basic sociological question of the relationship between symbolic norms and actual behaviour or practice, and especially of the efficacy of ethical rules when individual interest, pressing necessity or strategies of survival run counter to them. This is not to detract from the value of the various experiments in joint management of forest areas by local populations and the forest departments now going on in India, or to deny the virtues of communal control of common property resources, as it is urgent in any case to do away with the abuses of exclusive state control of the forest biomass. But the emotional reference to what is in essence the western phantasm of 'the world we have lost' is scientifically unsound and probably only serves to make the necessary political compromises more difficult.[5]

This does not mean that we should systematically minimise the importance of the colonial impact on natural environments. From many points of view, it represented a radically new phenomenon. First, it was an attack on the world scale, corresponding to the phase of expansion of western merchant and industrial capitalism. Second, the intruders had means of conquest at their command which were generally out of all proportion to those of the local societies. Third, the offensive was backed by a conquering modern ideology according to which nature ceased to be the sacred order of things,

or the abode of the gods (as Marx said, it was 'disenchanted'). It had become an object to be mastered, exploited, transformed, and commoditised, a means of speculation, a merchandise (and there is no need to lay the blame for this promethean and depreciating attitude to nature on the tradition of Christian anthropocentrism, as has sometimes been done.[6] Fourth, the colonisers carried with them techniques and tools, introduced crops and forms of animal husbandry, opened up routes for diffusion and exchange, which irreversibly altered the local socio-ecological configurations. And finally, to serve their own interests, they set up everywhere an increasingly efficient framework of governmental control, which gradually denied the local populations free access to their traditional natural resource bases, at a time when their numbers were beginning to increase. Although the ecological stresses and traumas resulting from European colonisation were not by any means the first events of their kind in the tropics, the scenarios for the first time were modern, representing the onslaught of commercial and industrial capital on the natural resources of the world at large.

II
Domestication of Tropical Nature

Cultural perceptions of the forest are always ambiguous. On the one hand, the forest is a generous provider of plant and animal resources, a space for freedom, pleasure and adventure, a refuge against the evils of war or the contradictions of society, and a place of spiritual retreat, of regeneration, of salvation, where saints choose to reside, and where, according to the Hindu model of the 'ashramas', men ideally should retire as 'vanaprasthas' (forest dwellers) at the end of their life. On the other hand, the forest is viewed as a land of the unknown and the unpredictable, inhabited by outlaws and wild tribes, and a haunted space, the abode of threatening and undominated forces, demons, or the spirits of the dead. It is the 'other side', against whose dangerous intrusions men and communities have to protect themselves. One of the major responsibilities of the 'raja' in Hindu tradition was to extend his domination over these wild areas, to placate the uncontrolled powers inhabiting them, and thus to protect his people against them, while displaying his own superior might.[7] Guardian gods and goddesses in the Indian countryside are placed at the outer limits of the cultivated space, facing the wilderness. One could characterise the social perceptions of the desert in equivalent terms.[8] In one form or another, this kind of interplay between the geographical and the symbolic occurs in all cultures. The colonial perception of the tropical forest was no exception. On one side there is 'the emerald forest', the fantasmatic illusion of pure virgin nature in all its profusion and beauty; on the other there is the 'green hell', a tentacular and entangled plant-world, essentially hostile, where invisible dangers lurk.

The perception of animal life was even more ambiguous because of the anthropomorphic characterisations of animal behaviour, which projected onto it all the ambivalences of the human soul. This is particularly obvious in the vast colonial literature of hunting stories and memories. In the ideology of the colonial hunt, besides the quest for adventure and prestige, there is on the one hand a fascination with natural beauty, and on the other a sort of urge to exterminate symbolically the dark side of human nature, that is to say human defects which are attributed to animals, such as cruelty, cunning, treachery, thieving or murderous instincts. The hunt is also a symbolic re-enactment of the victory of the forces of civilisation over savage nature.

Finally, even the human societies of the forest and of the savanna were commonly stylised, according to a sort of brutal naturalist reductionism, into elementary essentialist characterisations. The aborigene in the bush or the forest was described as childlike, ingenious, unpredictable, potentially dangerous, and he was seen as a survival of primal human savagery, entirely determined by the ecology of his habitat.

Ideology of Exploitation

Everywhere in the colonies, the forest was at first considered as an obstacle to the rational and profitable use of the land. Colonisation bred the emblematic figure of the pioneer, whose symbols were the axe and the gun, both tools of destruction whose ultimate purpose was to substitute civilised order for savagery. And the aborigene himself, whenever organised and productive exploitation of natural resources became the order of the day, often came to be seen as standing in the way, as a trouble-maker, who had to be displaced or neutralised. It should be plain however that the will to clear, dominate and exploit wilderness was not by any means a cultural specificity of the western coloniser.[9] Even in Hindu culture, which lays a stonger stress than most on the necessary conformity of the human order to nature, the duty of kings, as set out in the *Arthashastra* for instance, is to extend their kingdoms both by military conquest and by clearing and colonisation of virgin land. But the colonial onslaught on the forests was worldwide, and it was carried out by Europeans with powerful technical means, so that its effect was unprecedented.

The agents of this development were colonisers who, so to say, "carried their ecology with them".[10] They renamed regions, trees, animals and landscape elements after those with which they were familiar in their countries of origin. They were bent on applying western principles and techniques of cultivation in non-temperate environments to which they were not adapted, at the cost of repeated failures. They were culturally biased in favour of settled agriculture or cattle raising and against itinerant life-styles such as shifting agriculture, which was considered wasteful and unproductive. As far as forestry was concerned, their ideal was the plantation – which is a domesticated, rationalised, optimised form of the forest. Colonial forestry, as a rule, was mainly concerned with a few commercially valuable species, while the species commonly used by the local populations were extremely numerous. The ideal of the foresters in French Africa or Indochina, according to the principles that were taught at the school of forestry at Nancy, was homogeneous populations, closed formations, and tall, straight tree growth. The German tradition of forestry, which spread to the Dutch and British colonies, was no less single-minded. In India as elsewhere, the foresters sought to increase the commercial profitability of the more accessible forests through the systematic plantation of a very small number of species, such as conifers in the Himalaya and teak in south India, species which were of little use to the local populations, as contrasted to many other species which were eliminated.

The application of these eco-ethnocentric concepts overseas led to the destruction or reshaping of landscapes and the displacement of indigenous populations. As always, human intervention in natural systems determined a transition from complexity to relative homogeneity. The main trend was towards the substitution of single-species cultivation for natural diversity, the replacement of prolific generalised ecosystems by specialised ones (and especially agro-systems). This was often done on the basis of an inadequate knowledge of the environments involved, leading to spectacular failures. For instance, there was an erroneous belief, particularly in the first phases of colonisation, in the exceptional fertility of tropical soils, based on the luxuriance of spontaneous vegetation. Knowledge of the dynamics of tropical forest ecosystems was extremely scanty; a high rate of failures in these conditions was inevitable.

Features of Tropical Ecocide

It was normally in its initial phase that colonisation of natural environments was most carelessly destructive. The process sometimes began with the conquest itself, when deforestation was part of military operations. Defensive forests were as common in the tropical world as they had been in the ancient and medieval west. Muslim chronicles in India often refer to the forests

that the armies of the sultans of Delhi or the Mughals had to chop down in the course of their campaigns against rebel chieftains. Even as late as the 1850s, at the time of the Sepoy Mutiny, most of the 159 strongholds of the taluqdars of Oudh were mud forts bordered by ditches and surrounded by 'jungles'.[11] A forest was an obstacle to the movement of armies; it could easily become a base of resistance or guerillas; it provided a convenient refuge to criminal elements; in short, it stood in the way of political hegemony, and it also formed a barrier to agricultural expansion. Forest destruction was consequently a common feature of the colonial conquest in south Asia as elsewhere. It is known, for example, that the forests which protected the heights of the kingdom of Kandy in Ceylon were razed at the time of the British onslaught.

In the first phases of colonisation, forest exploitation was generally extremely improvident and wasteful. The scenario was more or less the same everywhere. The vastness and abundance of the forests encouraged the illusion that they were inexhaustible. The most accessible stands, close to the coast or to river banks, were attacked first, and they were destroyed without a thought for their regeneration, thus creating increasing difficulties, costs and delays (in transport, floating, etc) for later exploitation. The forest was gutted to procure a small number of precious species. Dozens of trees were damaged in the process of felling a few. Massive felling was done just in order to extract some 'minor products', as in Java where sometimes several hundred camphor trees would be sacrificed in order to find one containing crystallised camphor. It must be added, however, that in this regard, as in the case of military deforestation, colonisation did not mark an absolute beginning, but often an acceleration or systematisation of earlier practices, made easier by the introduction of more effective techniques and tools. Everywhere the export of valuable woods or 'minor forest products' had started long before colonisation.

More radical was the razing of forests to the ground, with the consent of the colonial authorities, in order to develop plantations, commercial cultivation or animal husbandry. The most spectacular ecological transformations of this kind were those which took place on islands such as New Zealand, the Canaries or New Caledonia. New Zealand was almost entirely deforested by the European agricultural settlers in a little more than a century, and most of the wood was burnt on the spot because the overproduction was such that it had practically no market value. In New Caledonia, which became a French colony in 1853, the Kanak agricultural system, which was based on a delicate balance between forest, grasslands and horticulture, was driven back by European cattle raising. The cattle were introduced by the while settlers in the hope of repeating the Australian 'miracle'. The Neo-Caledonian savannas were more or less similar to those of eastern Australia, and as J Barrau says, "with their historical experience of livestock farming, Europeans could not see these grasslands without immediately thinking of cattle".[12] Land was taken from the Kanaks and where necessary it was deforested and converted into pastures. The bovines had been introduced in the 1850s. By the 1880s, there were close to 90,000 of them on the island, roaming freely everywhere, trampling down and destroying the elaborate irrigation and drainage system of the Kanak horticulturists, breaking up their gardens, and endangering their very subsistence. Then, as the soil was in fact poor and had become subject to erosion, and the grass overgrazed, these pastures soon became unproductive and the yield of the cattle farms went down. This prompted the settlers to take more land from the Kanaks. In the end, they were confined in a few tiny reserves encircled by huge cattle farms, where each bull enjoyed much more living space than each individual Kanak in his reserve.

This phenomenon was universal, though in differing degrees, throughout the colonial world, because exploitation of the land was one of the main reasons for colonisation as such. Let us remember that the Permanent Settlement of Bengal was designed, among other purposes, to induce the zamindars to increase the profitability of their lands: the land revenue being fixed once for all, any increase in their rent rolls would remain exclusively theirs. This of course represented a powerful incitement to the clearance of forest and jungle on their zamindaris, and in this way the Permanent Settlement became an engine of deforestation in eastern India.

Local contractors and timber dealers often played an important part in the deforestation. For instance, local merchants and proprietors carried out reckless exploitation of the forest of the western ghats during the first half of the 19th century before the advent of strict government control, and private contractors (almost all Indian) were prominent in the harvesting of the 'sal' and 'deodar' forests of northern India for railway construction.[13] The building of the huge railway system of the Indian empire was a major windfall for the Indian timber business. The story of railway deforestation in India is well known, and need not be repeated here.[14] Let it only be said that the railways required more than one million sleepers every year in the 1870s, each sleeper lasting normally 12 to 14 years. One average mature tree (sal, teak, and deodar being the only species of appropriate strength) could provide seven sleepers. Until the 1890s, when the use of coal began to become general, the forests also had to [illegible]

The way in which the Indian forests were being worked by private enterprise was as a rule extremely wasteful. This is one of the reasons of the creation of the forest department in 1864, as it appeared necessary to protect the forest capital of the empire more effectively in order to cater to the needs of the railways. In Sri Lanka, Ceylonese timber merchants (who in addition had a stake in coconut and rubber planting on the deforested areas) played a decisive role in the deforestation of the island. So did Indonesian and Chinese entrepreneurs in the Indonesian archipelago, and Chinese dealers in timber and forest by-products in French Indochina. Yet the main agent of environmental transformation was the European coloniser. The local merchant or contractor who took part in the process operated within an economic framework which had basically originated in the colonial situation.

The extent and methods of colonial deforestation all over the world have been the subject of active research for several years now. The accounts of the martyrdom of colonised nature in the tropical world are sadly repetitive, and I will not dwell at length on this aspect. Because of the lack of scientific knowledge the fellings led to massive and irreparable ecological mistakes. Even past experience did not always restrain destruction, because the quest for short-term profit led to disregard of long-term consequences. One significant example is that of the extensive fellings carried out in Ceylon by the first generation of coffee planters, who were but adventurers looking for quick profits at all cost and who were ready to abandon their lands as soon as they were exhausted, as the cost of virgin land at that time did not exceed a few shillings per acre.[15] Once they had left, however, the ecological damage remained and the local populations had to put up with it. Actually, in the colonising countries themselves the disadvantages of too-intense deforestation were well known. England and the Netherlands had lost almost all their forest cover when they started exploiting that of their tropical colonies. In France, the forestry school at Nancy was created in 1827 in response to the need for careful management of what remained of the forests in the country. But nowhere in the colonies was any serious attention paid to the necessity for scientific working of forests before the second half of the 19th or the beginning of the 20th century. Indigenous practices for the management of the natural environment were unknown or ignored. In pastoral zones, overgrazing was the great danger. Thus in the South African veldt the grass was over-cropped by the sheep of European settlers, whereas in former times the indigenous Hottentot farmers used to migrate with their cattle at the first indication of decline. The same was the case

with the rapid degradation of the grasslands of New Caledonia, which had been mistaken by the European settlers for rich natural pasture, and which, besides losing their fertility through soil erosion, were soon overgrown because of selective grazing by the cattle, by unpalatable grasses and various introduced weeds.[16]

One of the main reasons for these ecological failures was the fragility of the specialised agrosystems which took the place of the destroyed generalised ecosystems. The more an agrosystem is specialised, the more it is rigid and vulnerable and the greater are the efforts necessary to protect it and to maintain its productivity. As a rule, the replacement of a diverse biocenosis by a monoculture activates predators and parasites who live at the expense of the cultivated species and whose impact was previously limited. The expansion of open, disturbed habitats favours the proliferation of weeds (many of which were unwittingly introduced by western man himself, particularly from the New World). Such ecological mechanisms soon lead to difficulties in maintaining the artificial ecoysystems, and sometimes to total failures. To give only one Indian example, one may cite the case of the coffee plantations in Coorg. Coorg had been occupied by the British in 1834 and was still covered with dense evergreen forest or (to the east) thick jungle 20 years later. It was only after the advent of the European coffee planters that the large-scale felling of forest began. The first European plantation was started at Mercara in 1854. Land being cheap and profits substantial, a veritable rush developed during the following years. Thus 20,000 acres of dense forest were cleared in a little more than a decade. But within a few years, the coffee trees began to suffer from bug, leaf rot and leaf disease, and they became prey to a devastating pest, the borer. A commissioner was appointed in 1868 to investigate the ravages of this insect. The felling and burning of extensive areas of forest had destroyed a great deal of the surface soil. Then the practice of exhaustive weeding, designed to show a clean surface (a clear case of imported ethno-ecological prejudice), increased soil erosion. Forest destruction caused recurrent failures of drainage and also induced unforeseen imbalances in the fauna. All this largely explained the proliferation of the borer. An increasing number of estates were abandoned, especially after a commercial slump had set in because of competition from Brazilian coffee. And to crown it all, the abandoned estates were soon overgrown by lantana, a shrub introduced in 1863 by local British settlers for their gardens, which proliferated across the hill-sides in the form of a dense scrub.[17] This kind of ecological blunder, due to the under-estimation of the vulnerability of artificial monocultural ecosystems, occurred everywhere in the colonial tropics. The reafforestation with single species led to similar difficulties. Drastic changes in vegetation and mistaken agricultural practices such as total removal of grass-cover or down-slope drainage, had destructive effects on soils: erosion, leaching, laterisation. In 19th and early 20th century Sri Lanka for instance, deforestation by coffee, tea and rubber planters caused heavy soil erosion. Streams and rivers were increasingly blocked by alluvival deposits; they became unnavigable and subject to sudden flooding; peasant irrigation systems and rice fields on the valley floors became silted up. In 1931, when a soil erosion commission was finally set up, the director of the Kew Botanical Garden wrot to the government of Ceylon that "this island seems to be dissolving in water".[18]

I will only mention in passing the question of the extent to which deforestation affects climate, and especially rainfall patterns, as this question, which has been a subject of speculation for two centuries, is still controversial. But it is highly probable that the effect was not negligible. It was also injurious to the health of human populations, as in Sri Lanka, where recent research seems to show that the spread of plantations (for reasons which are still debated) has aggravated the incidence of endemic malaria.[19]

The European onslaught on the natural and especially forest resources of the colonies entailed the disruption, at least partial, of the mode of life of the indigenous societies of the areas concerned. It is the heavily unequal balance of power, and the establishment in the conquered countries of a modern type of centralised rule, which made possible the displacement or the forced adaptation of these societies, whose former relations with their natural environment were more or less brutally shattered. I would thus like to turn to the attitudes of the colonial states, particularly of the British colonial state in India, towards nature, its exploitation and conservation.

III
Colonial States and Nature Conservation

Exploitation/Protection

In the colonies, as a rule, the military administrations which took over immediately after conquest were gradually replaced by governmental structures inspired by those of the colonising countries. Whatever the official policy pronouncements, the conquered territories were generally organised empirically, according to immediate needs and without any very strong predetermined plan. Yet there was at the background the general conception of government implicit in the modern western liberal ideology, which is that government must be rational, autonomous and uniform. In this sense, the colonial governments represented to some extent attempts to adapt to exotic circumstances and conditions the processes of institutional development that the colonising nations had experienced a little earlier, or were experiencing at about the same time. The institutions of government created in the colonies were not, however, as in the home countries, the outcome of endogenous historical processes. These institutions had no roots in the culture of the colonised societies, and they often did violence to them. The establishment of state controls over the natural environment must be seen as part of these general processes of institutional growth. It went hand-in-hand with the extension of governmental structures and regulations into all domains of public life (or more exactly, with the expansion of the public domain and the creation of a new distinction between public and private). In India, for instance, the imposition of colonial state control over the forests during the second half of the 19th century was only one aspect of the all-round expansion of the modern state which characterised the post-Mutiny period of Indian history. Custom was being codified and ambitious modernising laws were passed. The colonial administrative network was growing and coming closer to the people. India was entering the statistical era, and it was being exhaustively surveyed, described and inventoried by way of maps, censuses, gazetteers and ethnographic compilations. Customary rights and practices in all walks of economic life were being listed, sifted, redefined and recorded for fiscal and judicial purposes. Road communications were being improved and the railway was casting its net over the subcontinent. In short, an attempt at the restructuring of Indian society according to the requirements of the modern state was under way. The seizure by the state of the natural resources it needed for its own reproduction and expansion was similarly on the agenda.

There are instances of royal or aristocratic monopolies over natural and especially forest resources in all great civilisations since very ancient times, and India is no exception to the rule. The prescriptions of the *Arthashastra* regarding the establishment of forest reserves for the protection of elephants, which were a basic component of the military strength of the Maurya sovereigns, are often cited in this regard, as well as the forest rules laid down by the Marathas in the 18th century to cater to the needs of state naval construction. What the ruling powers required everywhere for civil and military building as well as for their navies was high quality timber of large diameter, usually provided by species of slow growth, which had to be efficiently preserved by successive generations. This was the prime motive behind

Colbert's Forest Ordinance of 1669 in France, which organised forest reserves on the basis of growth cycles of 120 years. Forest (and game) were also very commonly protected to permit the proper accomplishment of an important ritual, the royal hunt, and of its more modest replicas at the level of lesser princes and local lords. The attempts of the ruling classes to control forest resources are thus in most areas a very old story.

What seems to have been lacking behind these efforts before the 18th century, as R Grove has shown, is an explicit theorisation of the finite character of the earthly stock of natural resources and of the vital need to organise its conservation.[20] The consciousness of the risks consequent on centuries of overuse of forest resources was however present in 17th century Japan when the Tokugawa rulers decided upon increasingly restrictive forest legislation to avert the impending scarcity of timber. The fact that Confucianism, which stresses the notion of harmony between nature and society, was then the dominant political ideology in Japan, may have contributed to the emergence of this policy.[21] Yet ecological problems of comparable magnitude in early modern China do not seem to have evoked the same kind of governmental response.[22] The genealogy of modern European conservationism both in Europe and in the colonies from the 17th to the 19th centuries is now known thanks to the work of R Grove.[23] It was strongly influenced by the realisation of the fragility of overexploited forest ecosystems in several tropical islands colonised by the French or the English, combined with the preromantic idealisation of nature. In France, the rigorous forest legislation of the Revolution and the Napoleonic Empire completed and reinforced by the Forest Code of 1827, marked the end of the extensive utilisation of the forests by the peasants and the confining of agriculture within strictly circumscribed spatial limits. The French National School of Forestry was created at Nancy at about the same time (1824). Nature had then come to be perceived not only as a vulnerable provider of precious resources, but as a public heritage to be preserved. This conception arose simultaneously with the idea of the monumental or architectural heritage. The phrase 'historical monument' was coined in the early 19th century.[24] Both the vestiges of the national past and the remnants of supposedly unspoilt nature, forests and marshlands, sites and landscapes, were now viewed as a legacy from past generations which was to be protected. Why were they 'sanctuarised' in this way? Apparently mainly because they were part and parcel of the collective cultural identity of the people, of its common history, symbols of a beautiful or glorious past, the memory of which had to be protected as a base of national unity. In any case, whatever the ideological content of the new conservationism, it was clearly directed *against* the local populations, and especially against the peasants. Their customary rights of user and the depredations of their cattle were considered from then on as the major threat to the remaining forest areas.

It is no matter for surprise that these conservationist ideas were introduced in the 19th and early 20th centuries in many areas of the tropical world in the wake of European colonial expansion, though generally with more exclusively utilitarian aims and at times considerable delays. The expansion of state control over nature was in fact much easier there because of the absolute character of colonial rule. However, one should not overlook the fact that official policies were only partially effective. There were frequent variations in official policy options. There were contradictory pressures from the non-official European settler communities. There was the chronic dearth of financial and human resources in a domain that was long considered of secondary importance. There was the lack of scientific and technical expertise. There were the numberless difficulties of policy implementation. And, last but not least, there was the fear of social disorders. In spite of considerable variations in chronology and emphasis from colony to colony, the overall line of development was more or less the same everywhere. First, natural resources were exploited in a virtually uncontrolled fashion by the newcomers. Then the colonial authorities would begin to protect them for their own use. Finally, the expanding modern state would increasingly take over the management and exploitation of these resources, while conservationist imperatives began to find a place in official policies.

The protection of nature in the colonies appears to have been mostly limited to the minimum required for the satisfaction of the states' needs for biomass. Early prohibitions on felling were made partly under pressure from the navies, for which the colonial forests were precious suppliers of timber for shipbuilding. Such was the case in the Netherlands Indies in the 18th century, as well as in British India at the beginning of the 19th century (after American independence had stopped the timber supply from North America), in New Zealand a little later, and again in French Indochina in the 1860s. South Africa's 'Forest and Herbage Preservation Act' dates from 1859. It was one of the earliest of its kind. Dutch action in Indonesia was unusually early, with the first forest regulations appearing in Java as early as the 17th century and the first attempts at sylviculture in 1730. But these were only sporadic localised efforts, not an overall policy. Forest regulations in Indonesia kept changing at short intervals up to the end of the 19th century, and they aimed only at ensuring a steady supply of teak. In British India there is evidence of governmental interest in environmental questions at least from the 1840s. But here also the main motivation was the necessity to meet state timber requirements (especially for shipbuilding and later for railway construction), and this was the main consideration behind the famous Indian Forest Act of 1878.[25] In Ceylon on the other hand, the planters' lobby managed to block any serious conservationist attempt on the part of the government until the 20th century. This was even more the case in New Zealand, where although a forest law had been passed as early as 1874, the public authorities shared, in a more or less unacknowledged fashion, the basic objective of the settlers, which was to extend agriculture through forest clearance. In the French colonies, where forest management seems to have been much less strict and systematic than in the British ones, no serious consevationist measure appears to have been taken before the 20th century. The earliest forest reserves in Indochina date from after 1903. They only began to be created in French Africa from the 1920s onwards (although the first reports pointing out that they were needed date from 1900).

These matters often aroused the interest of public opinion in the colonised countries (mostly in European circles, at least to start with) from the end of the 19th century onwards. Colonial associations for the protection of nature appeared, which exerted pressure on the local authorities. The nationalist movements, it must be noted, were often suspicious of these bodies, and saw conservation as another ruse of the colonisers to alienate the local populations from their traditional natural resource bases. Official recognition of the gravity of the problem, in any case, sometimes took much longer to manifest. While in India the first effective measures of forest protection were taken towards the middle of the 19th century, in New Zealand nothing of the kind was done until after the first world war, and in French Indochina (where foresters had however, been giving warning reports on the topic since the end of the previous century) before 1930.

One of the major problems of forest policy everywhere was lack of funds. Forest services were for very long periods mere extension of departments of agriculture or revenue, and only gained independent departmental status much later. The forest department of British India, created in 1864, seems to have been the first of its kind, although Dutch initiatives in the same direction, but not followed up, had shown the way in Java. Before and even after the creation of these departments, the responsibility for the exploitation of the forests was often left to private enterprise, since the governments

did not have the means or even the desire to take it up themselves. The French forest services in Africa and Indochina all date from the 20th century, and that of New Zealand from 1920. One of the conditions imposed on these services was that they should be self-supporting and provide surplus revenue to the state. In India, for example, it is well known that the principle of British imperial policy was that the country had to pay for its own management. When the creation of the forest department was under discussion in the 1860s, one of the main objections that were raised against Brandis, the then inspector general of forests, was that a forest department was bound to be unprofitable and would be a burden on the colony's exchequer. After the creation of the forest department the suspicion remained, and the department always had to prove conclusively that it was making profits. Thus the forest departments had to put their main emphasis on commercial exploitation of the forests rather than on maintenance and improvement. The number of professional foresters was everywhere very limited. Both the administrative staff and the subordinate forest staff (especially forest guards) were few in number and for a long time training was inadequate. To cite an Indian example: in Coorg around 1890 there was only one qualified forester for 850 square miles of reserved and protected forests. In north Kanara district in 1882, there was one forest guard for every 60 square miles of reserved and protected forests. The foresters, as a rule, rarely had time and money to spend on research, and they complained bitterly of this. For both forest conservation and sylviculture, they mostly proceeded empirically, by imitation or by trial and error, with frequent failures. The conservator of forests for Madras Central Circle, in the evidence which he laid before the Indian industrial commission of 1917, declared that "the forest department in the Madras presidency is so seriously undermanned that it is quite impossible for any of its officers to engage in serious research work", that "the government is content to keep it in a constant state of struggling inefficiency", and that "there seems to be a deeply rooted objection on the part of government to permit the growth of the forest organisation in this country to keep pace with the times".[26]

The protection of animal life followed far behind forest conservation. Hunting regulations in the 19th century were only arrangements to maintain monopolies, similar to those imposed on their lands by the local rulers before the colonial era. In British India these regulations weighed mainly on tribal groups who hunted for subsistence, while the 'shikar', a European pastime, was allowed to thrive (as it did in the princely states). These game laws, it must be added, It is, however, the Forest Act of 1878 which instituted closed hunting seasons and which made hunting permits compulsory. The first truly conservationist acts passed for the protection of endangered species date from the 1920s in Indonesia and the French African colonies. Overall, in actual official practice, the protection of nature, in the strong sense of maintaining sanctuaries, is a recent phenomenon. The first wildlife sanctuary and the first national park were created in India during the last 20 years of colonial rule (while there are today some 70 national parks and more than 400 sanctuaries covering 4.5 per cent of the total geographical area of the country). Throughout the larger part of the colonial period, conservation of the natural heritage everywhere aimed primarily at ensuring a permanent supply of forest products to governments and commerce.

Rationalisation

Wherever state control over colonial natural resources expanded for the purpose of organised exploitation, it did so at the expense of local societies whose mode of subsistence was closely dependent on the natural resources in question and only marginally on the market. From the productivist point of view of modern management, the indigenous cultivator with his customary rights of usage, his manifold uses of biodiversity, his small-scale, erratic clearings, as well as the nomadic pastoralist with his destructive herds, represented a hindrance which had to be done away with somehow or other. The European coloniser had been brought up in an old foodgrain civilisation and was ill-prepared to understand the modes of subsistence prevalent in tropical rainforest environments. He carried with him the archetypal opposition of the Latin agronomists between *ager* and *saltus*, which was deeply ingrained in the European mind. In his view, civilised order was not a climax forest with humans living in symbiosis with it, no matter how knowledgeable and sophisticated this interaction might be, but the domestic order of cultivated fields, or a plantation of selected species, where yields are carefully monitored and the return of spontaneous vegetation efficiently prevented. The representation of space which accompanied the expansion of the colonial state was the modern conception of the administered space, where the central authority carries the same weight everywhere within fixed territorial boundaries, where rights of occupation and usage are clearly defined, where limits are clearly drawn. This vision of things cannot easily accommodate collective and unwritten customary rights, the uncontrolled complementarity between agriculture and open forest, the migratory habits of shifting cultivators and nomadic herdsmen. Last, states cannot function without revenues. Accordingly, productive activities must be taxed, and the exercise of individual rights over public resources such as the forest ought to be licensed, a practice which discourages wastage while producing income. Thus colonial states everywhere created from scratch vast domains of public forests by declaring all wood-covered areas without a certified owner to be government property. Then the social groups who derived all or part of their living from those forests on a customary basis were brought under strict control or displaced. In such cases, of course, the recourse to legal concepts such as 'general interest' or 'public good' was particularly convenient.

Nothing typifies this attitude better than the frequent repression of shifting cultivation. This activity more than any other felt the brunt of the ethnocentric ecological prejudices of the colonisers, because it combined all the features which the modern ideology condemns. The shifting cultivators felled and burned substantial areas of forest for the sake, it seemed, of a few poor crops of low yield and nutritive value. They had no established rights in the land they cultivated. They led an unsettled and mobile mode fo life and paid little or no taxes. And their activity seemed incompatible with any organised policy of forest conservation. Nomadic pastoralism was criticised along similar lines. It is usually the alleged destructiveness of nomadic herding, its low profitability and the mobility and indiscipline of the social groups practising it which were incriminated. The policy of the colonial administrations, where they were bent on suppressing shifting cultivation or restricting it, consisted in limiting the forest areas where the clearings were allowed, in reserving the activity to strictly defined social categories, in subjecting the grant of permits to the performance of labour prestations for the forest departments, and finally in encouraging the populations concerned to adopt sedentary ways of life as settled cultivators or agricultural labourers.

It is however important not to over-simplify colonial attitudes. In fact, they were neither uniform nor unchanging. By and large, the dominant trends were more or less similar all over the colonial world. But the timing, the thoroughness, the modalities of the policies varied considerably. These policies were rarely adopted without discussions, which at times developed into vehement and protracted controversies, as was the case in India. In addition, the rules were often imprecise, the policy options varied, the latitude of evaluation and initiative left to the local administrators often considerable. In India, the discouragement of shifting cultivation often began at the initiative of the district authorities, before the ques-

tion, when it assumed importance, was submitted to the provincial authorities and by them to the central government. At that level, it gave rise to some heated debate during the last third of the 19th century. There were at that time among the officials many severe critics of the forest department, who indicted the ignorant and unsympathetic forest officers for the sufferings of the dispossessed hill people. But they were eventually defeated by the advocates of the 'cilvilising mission' of the colonial state (implicitly defined, according to the liberal conception, as the guardian of the general interest – which in the colonial context is not, to say the least, self-evident.)

On a more general level, the question of whether management of the forests of India should be taken over entirely by the state or carried out through community forestry and joint management between the state and villagers was subject to wide debate. Brandis, the first inspector general of forests, consistently (but eventually unsuccessfully) advocated the constitution of village forests of the kind that existed in his native country, Germany. The government of the Madras presidency, which was also in favour of community forest management, had similarly to give in for the sake of the superior interests of the imperial government (thus the Madras Forest Act of 1882 followed the Indian Forest Act of 1878 in all essentials).[27] The same debate was going on in France at about the same time between a small school of non-conformist foresters around Frederic Le Play, who refused the exclusion of the local communities from forest management, and the dominant tendency in favour of state monopoly over forest management. One authorised spokesman of state forestry (Berger) summed up in these terms the official thinking in 1865: "The state alone, which does not die, can be concerned about the future of society and assume the task of raising for it these great plants which take centuries to grow."[28] The terms of this old debate have of course become very relevant again in India today thanks to the rise of social ecology, to the work of NGOs in this direction all over the country, and to the ongoing experiments in participatory forest management conducted first in West Bengal and then in various other states with the active support of the forest departments. But in the colonised world, the state always had the last word

Holding Out

There was one limitation, however, which the colonial administrations could not totally ignore, which was the level of tolerance of the local populations. The social classes most affected by the regulations concerning the environment were often the poorest, the most vulnerable, the least able to pose a threat to the colonial governments: hunters-gatherers, shifting cultivators, nomadic pastoralists, poor peasants to whom the supplementary resources provided by the forest were indispensable. In the remote areas where the forest reserves were established, these regulations could represent the first truly disruptive intrusion of the modern state and of capitalism in the subsistence economy of the local people. Their apparent initial resignation, the overwhelming inequality in the balance of power between them and the state, the lack of structured channels through which they could express their anger or distress, could often create at first in the minds of the colonisers the illusion that they were indifferent to the changes. But forest regulations provided a superlative field for "everyday forms of peasant resistance"[29] in the shape of myriads of petty offences which often passed undetected and which the forest establishments were incapable of preventing or punishing with any efficacy. Localised flare-ups of violence, especially against the underlings of the forest administrations, were not infrequent however, depending on the circumstances. Tribal rebellions and peasant uprisings have punctuated the history of the colonial period everywhere. The ecological element that was often present in these movements has mostly been eclipsed in the eyes of historians by more obvious economic, political or religious motives. But premodern resistance movements can never be explained simply by the initiating incident which sparks them off. They are the outcome of complex combinations of social and cultural tensions connected in various ways with the life and values of the social groups involved, in which the disturbance of their relationship with nature often played an important part. To the colonial administrations, however, these crises fell under the category of agrarian or social disorders, the repression of which was part of the maintenance of public order. They were not considered as a serious danger so long as they were not taken up and organised by the educated elites able to widen their range by using modern forms of mobilisation and political agitation.

The balance of forces, from this point of view, varied widely from one colony to another. In French west Africa, where the classification of forests was extremely unpopular, the government was nevertheless strong enough to proceed with the reservation of forests in the Senegal valley despite the violence of the protests.[30] In Sri Lanka, the effects of the development of plantation economy on Kandyan agriculture played a role in the 1848 rebellion, and the repression of shifting agriculture was occasionally slowed down by collective resistance, particularly from the end of the 19th century, when it became a pretext or a tool in the conflicts which opposed local lawyers and speculators to the colonial administration.[31] The political effectiveness of these acts of resistance was greatest when there was a conjunction of popular discontent with agitation organised by nationalist elites, as was the case in some regions in India at the time of the non-cooperation movement (1920-22), and on a much larger scale during the civil disobedience movement campaign of 1930-31, when movements which were labelled, in Congress parlance, as 'forest satyagrahas' (collective non-violent violations of forest regulations) erupted all over the country.[32] The spread of state control over the environment encountered, in this case, a real obstacle. But in a context like this, it is in fact the colonial situation itself which was being challenged, with ecological dispossession figuring as only one of many aspects of a domination which was globally called into question. India, whose national liberation movement was the earliest in the colonised world, was a precursor in this respect.[33]

IV
Conclusion

Before winding up, let me first restate my initial point. Strictly speaking, it would be inaccurate to characterise colonial periods uniformly as the most dramatic phases of ecological devastation for the countries concerned. The first official measures for protecting nature, whatever their motives and effectiveness, arose in these countries on the initiative of colonial governments. And independence has not put a stop anywhere to the destructive processes that were under way. On the contrary, they have accelerated. But it is nevertheless true that it was colonisation which in most cases initiated the processes from which all later developments originated. The newly independent states took over from the colonial states. The economic and political pressures from the developed world persisted everywhere after independence was acquired. Legislation, policies and administrative structures relating to the exploitation and management of natural resources were for the most part maintained. The disruption of the relationship between local societies and their natural resource bases has continued in the worldwide movement towards modernisation, which goes together practically everywhere with an unprecedented increase in the industrial demand for biomass arising from much higher rates of industrial growth, and of demographic pressure on the environment due to the population explosion. In post-independence India, the new ruling elite, supported by the business class, was committed to a resource-intensive state-subsidised pattern of industrialisation, the ecological cost of which was bound to be heavy. But at the time, this ecological trap

in post-war growth policies went largely unnoticed.

Thus the colonial phase of the history of tropical nature has to be set against the general background of the human history of nature. This is a history of continuous alterations and traumas and of continuous human responsiveness to those changing conditions. Human societies have shown and still show an almost limitless capability for situational adjustment. It would be erroneous to present the precolonial relationship between societies and their environment as a golden age of 'equilibrium' which colonial conquest disturbed or destroyed. Such a view, like the now obsolete 'tradition vs modernity' paradigm, assumes the normative operation in precolonial times of a system which in reality probably never existed, and which is in fact a culturalist construct, an ideal type meant to provide a baseline for the assessment (and indictment) of colonial change. We cannot concur in the mythology of the unspoilt, primeval, sacred wilderness with which indigenous societies supposedly lived in perfect balance from the dawn of history until the advent of Europe. This is one of the myths which lie at the base of that green fundamentalism which is known nowadays as 'deep ecology'. What we need, on the contrary, is a radical critique, with regard to this aspect, of capitalist expansionism, of which the colonisation of nature on a world scale has been one of the major objectives, and whose essential dynamics remain in operation, in a multipolar and greatly diversified context, throughout the formerly colonised world today.

Rapid Growth – The Corpo

Statement of Shri Gaur Hariram Singhania, Chairman & Managing Director, JK Corp Limited at the 56th Annual General Meeting held on Monday, the 7th August 1995

I cordially welcome you to this 56th Annual General Meeting of the Company.

RAPID GROWTH — CORPORATE STRATEGY

Our strategy for accelerated growth is yielding results. During the year under review, the turnover rose to Rs. 560 Crores and Gross Profit to Rs.103 Crores. The Net Profit at Rs. 51.5 Crores registered an increase of over 57% over the previous year. Exports at Rs. 29.2 Crores were nearly two-and-a-half times higher.

The momentum of rapid growth is evident from the fact that in the last two years, Turnover has doubled, Gross Profit has grown 2.3 times and Net Profit 4.8 times. The Earnings per Share has risen to Rs.13.18 from Rs. 5.60 in 1992-93 on a substantially enhanced Equity Capital of Rs.44.88 Crores which is more than three times the Equity Capital in 1992-93. The dividend to shareholders has gone up to Rs.11.79 crores in 1994-95 from Rs 3.22 Crores in 1992-93. Shareholders Funds at Rs.677 Crores have grown by two and-a-half times in last two years.

All the businesses in which the Company is engaged, viz: Paper, Cement, Polyester and Magnetic Tape are sectors of high growth and our strategy is to grow rapidly in these areas.

New capacities in Paper, Cement and Polyester Divisions involving an investment of nearly Rs.500 Crores were commissioned during the year under review. These have started yielding results. The Gross Profit during the first quarter of the current year is higher by 40% over the corresponding period of the previous year.

Further investments for increase in capacities and modernisation in the various Divisions amounting to Rs.700 Crores are on hand. These expansions would substantially increase the turnover and profit of the Company during the coming years.

HIGHLIGHTS

- During 1994-95
- Turnover rose to Rs.560 Crores and Gross Profit to Rs.103 Crores.
- Net Profit at Rs.51.5 Crores was up by over 57%.
- In the last two years,
- Turnover doubled, Gross Profit grew 2.3 times and Net Profit 4.8 times.
- EPS rose to Rs.13.18 from Rs. 5.60 in 1992-93 on three times enhanced capital.
- New capacities in Paper, Cement and Polyester Divisions at an investment of Rs. 500 Crores commissioned during the year.
- Additional investments for increasing its capacities and modernisation of various Divisions of Rs.700 Crores on hand.
- Gross Profit in the first quarter of the current year improved by 40% over the corresponding period of the previous year.
- All Divisions of the Company accredited with ISO 9000 Certification.

GDR ISSUE

During the year under review, the Company made a GDR Issue of 55 million US dollars successfully. The GDRs are listed on the London Stock Exchange.

QUALITY RECOGNITION

A significant achievement of the year was that the Company received ISO 9000 Certification in respect of all its Divisions and products endorsing the importance the Company attaches to Total Quality Standards and Systems. JK Paper is the first Paper Mill in India to receive ISO 9001 certification. Lakshmi Cement has received ISO 9002 certification, and JK Magnetics is the first and only unit in the industry in India to receive ISO 9002. As reported last year, Orissa Synthetics was the first unit in the Synthetic Fibre Industry to receive ISO 9002 for its entire range of products.

I consider this recognition of Quality Management as a tribute to the credo of excellence enunciated by the founding father of the Company, the Late Lala Lakshmipat Singhania. I also acknowledge the dedication to quality standards of the employees at all levels leading to this international recognition. I am confident that all in the Company would strive to maintain and improve upon these standards.

PAPER AND BOARD

JK Paper, true to its tradition, operated at more than 100 per cent capacity utilisation. Our products continued to enjoy excellent reputation for high quality. 70 per cent of our production is of high value added specialty papers and in several varieties we continue to maintain market leadership with strong brand image. A new thrust resulted in trebling of exports.

During the year under review, a new Specialty Paper Machine was commissioned increasing the manufacturing capacity to 75,500 tpa from 60,000 tpa. Further, technological upgradation undertaken would improve brightness and quality of paper, giving us a competitive edge.

A state-of-the-art new Pulp Mill of 1,00,000 tpa capacity being installed would increase pulp capacity, reduce cost of production, and improve the quality of pulp and paper. This would also reduce imports of costly high quality pulp.

The Paper manufacturing capacity is being expanded further to 1,25,000 tpa by upgradation of some of the existing paper machines and installation of a new one. These schemes would cost around Rs 450 crores.

The per capita consumption of paper in India at 3.2 kgs is far below not only the world average of 45.6 kgs, but even 11 kgs of Indonesia and 14 kgs of China. Paper consumption in India is thus bound to rise rapidly. In this context, it is necessary that India takes urgent steps to augment its forest resources. The need for urgently allowing industrial plantations and general afforestation programmes is therefore paramount. Industrial plantations would not only make available requisite pulp wood for the growing requirements of Paper Industry but also add to the green cover. Since these plantations have long gestation, the Government of India must immediately allow industrial plantations of renewable pulp wood. Otherwise, the consequences would be heavy imports of pulp and paper at enormous cost.

CEMENT

The Plant operated at near 100% capacity utilisation of the installed capacity. Lakshmi Cement, with its rigid quality parameters, continues to be the brand leader. Over 70% of the Company's production is of the value added 43 Grade.

Plans are on hand to produce 53 Grade Cement which is a higher value added product.

rate Mission

The increasing thrust on roads building, development of ports, creation of new capacities of power generation and other infrastructural projects and house building activity, is expected to result in accelerated demand growth for Cement. The growth rate of 8% p.a. during 1994-95 is expected to cross 10% in the next five years.

The Rs 400 Crores new Cement Plant of 9 lac tonnes capacity was commissioned in March 1995 increasing the installed capacity of Lakshmi Cement to 1.5 million tpa. Production on this unit is stabilising. The capacity of Cement is being further expanded to 2 million tpa by installing another unit at Lakshmi Cement with an investment outlay of Rs 210 Crores.

I am happy that the new capacities created in the Company, and in its synergy undertaking, JK Udaipur Udyog Limited, will be available at a time when demand growth of cement is on fast track.

POLYESTER FIBRE

The operations of the unit were affected in the last quarter by the unforeseen strike which has since been called off and normalcy restored.

The Polyester industry has been passing through a difficult phase due to shortage of DMT and PTA in international markets and consequent steep rise in prices. The prices of PSF and POY could not rise commensurately. There are signs of improvement in the scenario now.

The demand for Polyester Fibre in India increased five-fold during the period 1984-93. The 20% growth registered in 1993 is expected to continue mainly on account of the high preference of masses for cheaper and more durable fabrics, limited availability and high prices of cotton and the thrust on export of cotton and synthetic textiles.

On completion of part of the balancing scheme, the PSF/POY capacity of Orissa Synthetics increased from 23,000 to 28,200 tpa by September 1994. It would further increase to 38,000 tpa by March 1996 on completion of the full scheme.

MAGNETIC TAPE

Sales were higher by 27%. Magnetic Tape is a high growth sector, due to the electronic boom with expanding middle class consumers. The quality of audio magnetic tape manufactured by JK Magnetics is by far the best in the country and compares favourably with the reputed international brands. Market leader in audio pancake market, JK Magnetics is the preferred brand of leading music recording companies in India. A major breakthrough has been made in exports, with higher volumes to follow.

SYNERGY UNDERTAKINGS

Central Pulp Mills Ltd. — *a challenging task accomplished*

Last year, I had reported to you of the commissioning of 45,000 tpa capacity paper plant in Central Pulp Mills Ltd. after renovation. I am glad to inform you that with the technical and managerial inputs given by JK Corp Ltd., the two Paper Machines of CPM are operating at full capacity and CPM has turned the corner. Value added quality paper matching the market requirements is now being produced and even exported by this company — a feat accomplished in record time.

J.K. Udaipur Udyog Ltd. (JKUUL)

With the technical and managerial assistance of your Company, JKUUL has already achieved 9 lac tpa capacity and plans are afoot to increase the same to 1 million tpa. The turnaround of this unit was achieved during the first full year of operations. Substantial part of the Cement manufactured by JKUUL is of the value added 43 Grade.

REMOVE CONSTRAINTS ON BUSINESS RESTRUCTURING

The economic reforms initiated in 1991 have borne fruit. The direct results are evident in the large flows of foreign investment, increased industrial activity, growth in imports and exports, and increasing and welcome competition in the market place.

With the opening of the Indian economy, and integrating it with that of the global, the Indian corporate sector is faced with a dual challenge. On the one hand, there are new and vast opportunities, and on the other, they have to operate in an intensely competitive environment. This would require the Indian companies to formulate strategies to enhance productivity, efficiency and achieve economies of scale, in addition to induction of modern technology. Large amounts of capital would have to be raised. This would necessitate restructuring of business, flexibility and speed in decision making. It is unfortunate that even after four years of liberalisation, there still exist considerable constraints in regard to mergers, demergers, investments and loans, etc. The much talked about amendments to company law have yet to see the light of the day. Several suggestions including allowing non-voting shares, and buy-back of shares by companies are still to be accepted, although they are in vogue in a number of countries. I feel these measures, so very necessary to empower Indian corporate sector to play its due role in the rapid development of our economy, brook no further delay.

ACKNOWLEDGEMENTS

I acknowledge the continuous co-operation and support given to the Company by the Financial Institutions, Banks, Government authorities, Shareholders, GDR holders, Distributors, Dealers and last but not the least, the Customers.

Thank you.

This does not purport to be a report of the proceedings of the Annual General Meeting.

JK CORP LIMITED

Our future is in demand

Demand Side Factors and India's Industrial Growth

Pradip Maiti
R Kavita Rao

Using a dual economy framework, wherein the industrial sector is postulated to face an effective demand problem, the paper proposes to explore the extent to which demand side factors served as a constraint to growth of the Indian industrial sector, over the period of 1960-61 to 1989-90. The main factors considered are growth of agricultural output and of autonomous expenditure as indicators of demand side factors. We have also sought to explore the possibility of changes in the nature of the underlying relationships by using dummies, to demarcate the different sub-periods.

I
Introduction

INDUSTRIAL growth in post-independence India has been characterised by significant ups and downs. These have evoked considerable debate regarding factors affecting and/or constraining such growth. The fact that the issues raised in this debate remain unresolved calls for further investigations. The present paper is one such attempt, where we seek to explore the extent to which demand side factors have served as a constraint to India's industrial growth. Such a study becomes all the more relevant in the context of the programmes for structural adjustment and policies of liberalisation and privatisation being pursued in the recent times by the Indian government. While all such corrective policies are expected to relax any existing bottlenecks to supplyside responsiveness, it becomes pertinent to assess the role of the demand factors in her industrial growth so far.

The framework we shall use is a kind of dual economy framework. The growth of an industrial sector is generally looked upon as a part of a wider process of development of the economy, namely, a transformation from a predominantly traditional, agrarian setup to a modern industrial economy. The literature on dual economy models deals with the characterisation of such economies and constraints to industrial growth therein. This literature comprises of broadly two kinds of models. The set of classical and neo-classical models deals with a supply-led industrial sector, where the industrial sector does not face any effective demand problems.[1] The other set of models explicitly considers the problem of effective demand, where savings are not automatically equal to investment/autonomous expenditure and hence there is no guarantee that the profit maximising output of the industrial sector would be demanded. Possible constraints to industrial growth in a labour surplus economy then turn out to be insufficiency of autonomous expenditure, inadequate growth of agriculture, etc.[2] It is this latter set of models that we propose to use in the present paper for analysing the behaviour of industrial output in India during the period from 1960-61 to 1989-90.

A study of the literature on the industrial growth in post-independence India reveals that this entire period can be classified into three sub-periods. After an initial period of rapid industrial growth of almost 8 per cent of per annum on an average, a phase of slow growth set in. This phase, usually referred to as a phase of stagnation, extends from the middle of the 1960s to almost the end of the 1970s during which the average annual rate of growth of industrial output dropped to 4 per cent. During this phase, of course, the economy had gone through two successive droughts in the mid-1960s, another couple of droughts in the early 1970s and a number of oil shocks in the 1970s. Industrial rate of growth, however, picked up in the 1980s when it exceeded 7 per cent per year, on an average. Studies exploring these different phenomena have put considerable emphasis on agriculture-industry linkages on the one hand, and the behaviour of autonomous expenditure on the other.[3] As we shall see later, these two sets of factors also assume vital importance in the present paper. The paper is organised as follows: Section II presents our basic model while Section III reports the empirical results obtained. Some concluding observations are contained in Section IV.

II
The Model

The framework to be adopted is a dual economy framework in which the economy is disaggregated into two broad sectors – agriculture and non-agriculture. Non-agricultural sector includes industrial and tertiary sectors. Services produced by government administration will be a product of the non-agricultural sector and government consumption expenditure is the main item of expenditure on that product. The specification of the model is completed by making a simplifying assumption, namely, that foodgrains is the representative output of the agricultural sector. This assumption may be justified by an appeal to the fact that foodgrains production is important not only quantitatively,[4] but also qualitatively as its output and relative price are the two basic variables in macro models for developing economies.

The consumption demand for manufactured goods (C_m) comes from people engaged in both the sectors. Such demand from a sector depends on the real income originating in that sector and the relative price. If Y_n, X and p are respectively non-agricultural output,[5] foodgrains output and the relative price of foodgrains (i e, the ratio of price of foodgrains to the price of manufactures), C_m may be taken to depend on Y_n and pX. The former is a variable measuring real incomes of capitalists and workers engaged in the non-agricultural sector[6] while the latter gives a measure of income of cultivators. Of course, in the latter case one should consider not output of foodgrains as such, but the marketable or marketed surplus of foodgrains (X^s, say). However, to keep the structure simple and also because of the fact that no time series data on X^s for the country as a whole are available, we shall not introduce a variable like X^s. Instead, we assume that the marketable surplus in terms of manufactured goods (pX^s) is positively related to pX. However, once we recognise that the relevant variable which represents cultivators' real income is pX^s, we have to keep in mind that the marketable surplus (X^s) in a period comes partly from current production (X) and partly from production in the preceding year (X_{-1}). Hence we shall use two variables to represent cultivators' income in the current period, namely pX and pX_{-1}.

Apart from real income, the other variable which affects C_m is the relative price of foodgrains (p). A *ceteris paribus* rise in p will induce mainly income effect on the demand for industrial consumer goods particularly by those people who are dependent on the markets for their consumption of foodgrains (e g, industrial workers). The reason is simple. Given that their demand for foodgrain is price-inelastic, a *ceteris paribus* rise in p will force them to spend a larger fraction of their income on foodgrains, and hence to reduce their expenditure on industrial

consumer goods. Thus one may write

$$C_m = c(Y_a, pX, pX_{-1}, p) \quad (1)$$

The aggregate demand for industrial goods includes not only consumption demand, but investment demand, export demand and intermediate demand. Some of these demands are autonomous while the rest depend on sectoral outputs. However, so far as investment demand is concerned, private investment (PI) is affected by government investment in infrastructure and other capital goods. We may thus postulate that the aggregate output of the industrial sector (Y_m) depends on the explanatory variables included in equation (1) earlier as well as on the (real) autonomous expenditure on such goods (A_m):

$$Y_m = d(Y_a, pX, pX_{-1}, p, A_m) \quad (2)$$

The variable A_m may include (real) government investment (GI) and possibly also export of industrial goods (E_m). However, in our empirical exercises the sum of GI and E_m as an autonomous variable has not yielded better results than the one including GI only. Hence, the variable A_m is taken to consist of GI only.

The non-agricultural sector consists of industrial and tertiary sectors, and as mentioned earlier, services produced by government administration are a product of the non-agricultural sector and an autonomous item of expenditure on these services is government consumption expenditure. Thus the demand for the non-agricultural output will be affected by all the variables on the RHS of equation (2) as well as the (real) value of government consumption expenditure (GC):

$$Y_a = f(Y_a, pX, pX_{-1}, p, A_m, GC) \quad (3)$$

Before we proceed further, let us mention that (3) may be solved for Y_a to express the effective demand for Y_a in terms of other variables as follows:

$$Y_a = E(pX, pX_{-1}, p, A_m, GC) \quad (3a)$$

We now need only market demand and marketable surplus relations for foodgrains to determine its relative price. There is already a considerable literature on the topic (see, for example, Chakrabarti, 1977). We consider a simple model and postulate that the relative price of foodgrains is related positively to Y_a and negatively to lagged and current outputs of foodgrains:

$$p = h(Y_a, X, X_{-1}) \quad (4)$$

Equations (3) and (4) are the two basic relations determining equilibrium in the economy. Solving these for the two endogenous variables, Y_a and p, one gets

$$Y_a = F(X, X_{-1}, A_m, GC) \quad (3R)$$

$$p = H(X, X_{-1}, A_m, GC) \quad (4R)$$

Substituting the above in equations (1) and (2) one gets the reduced form expressions for C_m and Y_m, the two variables of our interest, as follows:

$$C_m = C(X, X_{-1}, A_m, GC) \quad (1R)$$

$$Y_m = D(X, X_{-1}, A_m, GC) \quad (2R)$$

TABLE 1: ESTIMATED LOG-LINEAR REGRESSION EQUATIONS FOR THE OUTPUT OF INDUSTRIAL CONSUMER GOODS (C_m)

Equation	Explanatory Variables (in Logarithms)

* This equation is obtained by re-estimating eq (2.7) after correcting for first-order autocorrelation of the residuals.

Our final step is to estimate the relations (1R) and (2R). This is discussed in the next section.

III
Empirical Results

In the empirical exercise the two variables C_m and Y_m are represented by the two production indices, viz, the index of production of industrial consumer goods and the general (i e, all commodity) index of industrial production, respectively. We have tried to fit both linear and log-linear regression equations for each variable. In each case log-linear equations have yielded better results and hence only these are reported in Tables 1 and 2. All equations are estimated by the OLS method and by using the annual observations[8] on the variables over the period from 1960-61 through 1989-90.

Output of Industrial Consumer Goods (C_m)

Table 1 reports results for C_m. The first exercise involving A_m, GC and the two series of foodgrains output as regressors yields good results with expected signs and satisfactory t-ratio for all estimated coefficients; $\bar{R}^2$ is quite high and DW statistic is satisfactory (eq 1.1 in Table 1). If A_m and GC are lumped together to form a single variable, A_n, the total autonomous expenditure on non-agricultural output (i e, $A_n = A_m + GC$), the result remains almost the same (eq 1.2) and the estimated coefficient of A_n turns out to be just equal to the sum of those of A_m and GC in eq (1.1). Henceforth, we shall report results involving mainly the total autonomous expenditure, A_n. It may be of some interest to inquire how equation (1) will look empirically when Y_n is replaced by the expression (3a). Equations (1.3) and (1.4) of Table 1 show results of such exercises.[9] The results are very good and all coefficients including that of p are of expected signs and have high t-ratios.

As we have mentioned earlier, the two widely debated issues in the context of India's industrial growth are those of industrial stagnation and revival which are supposed to have occurred around the mid-1960s and during the period of the 1980s, respectively. We have sought to investigate these issues in an indirect way, namely, by examining whether the structure of relations postulated in (1R) and (2R) would exhibit shifts across different periods. For this purpose, we consider a number of dummy variables – two intercept dummies (D′ and D) for the two periods, viz, the first half of the 1960s and the 1980s and a slope dummy for autonomous expenditure (DA_n) for the 1980s. The best result is obtained when all the dummies are present (eq 1.5). We find that all dummies have coefficients higher than unity, DW statistic is 2 and the slope dummy DA_n has a small positive coefficient. Although $\bar{R}^2$ remains the same as in equation (1.2), we choose equation (1.5).

Aggregate Output of Manufacturing Sector (Y_m)

With two series of foodgrains output and A_m and GC separately or their aggregate A_n as regressors, the estimated equations turn out to be quite good, except for the low value of the DW statistic and low t-value of the coefficient of X_{-1} (equations (2.1) and (2.2) of Table 2). Once again, one may be interested to know the empirical counterpart of equation (2) when Y_n is replaced by the expression (3a). The results for such partial reduced form expressions, given in equations (2.3) and (2.4) of Table 2, show that all coefficients have expected signs and are also highly significant. Interestingly, comparing eq (2.3) with eq (2.1) or eq (2.4) with eq (2.2), one finds that estimated coefficients of a given regressor are very close in the two equations.[10]

In order to investigate whether the relation involving these variables has undergone any shifts over time we introduce, as before, the three dummy variables, D , DA_n and D′. Regression results involving alternative combinations of these dummies are shown in equations (2.5) – (2.7) of Table 2. We observe that coefficients of all the dummies are significant along with those of other explanatory variables.[11] However, values of DW statistic for these equations are low, except that for equation (2.7), which falls in the inconclusive range. For the equation (2.7), the first-order autocorrelation coefficient (ρ), based on the regression residuals, is estimated to be 0.1935. Using this estimate of ρ, the equation (2.7) is re-estimated after correcting for first-order autocorrelation and (2.8) gives this re-estimated equation. We observe that DW statistic has improved substantially and magnitudes as well as t-ratios of all coefficients have remained more or less

TABLE 3. DATA ON SELECTED MACRO VARIABLES OF THE INDIAN ECONOMY

Year	Index of Industrial Production (Base 1980-81 = 100)		Relative Price of Foodgrains (Base 1981-82 = 100)	Foodgrains Output* (Million Tonnes)	Government Final Expenditures at 1980-81 Prices (in Rs Crore)

Note: * The value of X for 1959-60 is 67.5.
See Rao (1993) for the sources and method of computation of these data.

unchanged. One may, therefore, choose either equation (2.7) or equation (2.8).

IV
Conclusion

Our empirical results show that policy variables like government consumption and investment expenditures have played a crucial role in influencing the industrial production in India during the last three decades. These are all demand variables. Another factor is also found to have been important, viz, the growth of the agricultural output – perhaps a mixed variable representing both demand pressures and supply of wage goods. These are in fact the variables which are supposed to play vital roles in process of industrialisation in the various dual economy models.

An interesting observation of the study is that the elasticity of industrial output with respect to a given explanatory variable has varied across different periods. As the positive coefficients of the slope dummy DA_n in the two tables indicate, a one per cent increase in autonomous expenditure (A_n) is observed to induce a larger increase in both the aggregate industrial output and output of the industrial conmsumer goods in the 1980s than in the preceding period. Some plausible explanations may be advanced for such an increase in the value(s) of multiplier corresponding to autonomous expenditure in the 1980s. The marginal propensity to invest might have been higher in the 1980s; also the marginal propensity to consume the industrial good might have been larger in the 1980s, presumably owing to some shifts in the distribution of personal disposable income in this period towards groups having higher propensity to consume the industrial good. Another contributory factor seems to be the change in the pattern of expenditures and revenues of the government in the 1980s. While the tax rates are found to be more or less stable in the 1980s [Sen Gupta 1993; Kelkar et al 1991], transfer as a percentage of total expenditure and presumably as a proportion of GDP has increased [Rao and Tulsidhar 1991:19]. This might have increased the multiplier effect associated with a given increase in autonomous expenditure in the 1980s than in the past.

Notes

[Comments from Amitava Bose and technical assistance from Shubendu Chakravarty and Somesh Saha are gratefully acknowledged. Authors themselves are, however, responsible for whatever errors still remain.]

1 The pioneering models in this group are Lewis (1954), Jorgenson (1961) and Fei-Ranis (1964). A survey of some of these models can be found in Dixit (1973).

2 Rakshit (1982) builds up formal macro models involving demand constrained industrial sector. A survey of all the different types of models can be found in Rao (1992).

3 See, for example, the studies by Ahluwalia (1985, 1991), Bagchi (1970), Chakravarty (1979), Lahiri et al (1984), Nagraj (1992), Rangarajan (1982). A critical analysis of the various studies on behaviour of industrial output can be found in Rao (1993).

4 For instance, foodgrains output has a weight of 68 1 per cent in the index numbers of India's agricultural production with the triennium ending 1969-70 = 100 as the base.

5 This may be interpreted as the value of outputs of non-agricultural goods at constant prices.

6 A rise in Y_n is expected to raise the income of the workers. Further, if the outputs are demand-constrained, producers produce less than their profit maximising levels of output and hence a rise in output will raise their profits also [Rakshit 1982:19].

7 A clear exposition of such effects of p on C_m is given in Rao (1992). See also Bose (1993).

8 The data are given in Table 3. The sources and the methods of construction of these series are discussed in Rao (1993).

9 Since pX and pX_{-1} appear as regressors, these equations may be called partial reduced form equations. Given that these equations contain an endogenous variable p and that we are using OLS, these particular estimates may suffer from simultaneous equation bias.

10 This may imply that coefficients in equations (2.3) and (2.4) are not very much affected by simultaneous equation bias

11 We have also tried with a slope dummy for A_n for the period of the first half of the 1960s, but its coefficient has not turned out to be significant.

Missing Females: A Disaggregated Analysis

S B Agnihotri

The problem of sex ratio imbalance in India needs a disaggregated analysis. The absence of such analysis masks the seriousness of the problem among certain groups and in certain areas. This paper presents data on the female/male ratio for scheduled castes, scheduled tribes and the rest of the population. While further disaggregation among various subgroups is necessary, the data presented here help to identify some major problem areas.

THE adverse female-to-male sex ratios in South Asia has attracted considerable academic and policy concern in the recent years. Among different regions of the world, South Asia stands out both for low sex ratios and lower life expectancy at birth for females [Sen 1987 T-1]. The Indian subcontinent represents extreme manifestation of this pattern.

Census reports in India have voiced concern over the declining trends in the sex ratios [Nath 1991]. This decline has taken place steadily since the turn of the century [Bose 1991]. The seeming reversal in this trend in the 1981 Census had given rise to much optimism. This has turned out to be short-lived with the 1991 Census figures indicating a decline in this ratio to 927 females per thousand males. Available data reveal that increased urbanisation or improved economic prosperity has not necessarily resulted in correcting these adverse trends [Kynch and Sen 1983; Krishnaji 1987]. As to the understanding of the phenomenon, the official position is that it is "... difficult to pinpoint any particular reason for the declining sex ratios which require a detailed analysis ..." [Nath op cit].

The available literature on this subject is dominated by two themes and an omission – that will be the subject matter of some detailed analysis below. The 'omission' refers to the absence of an analysis of the sex ratio patterns among three distinct categories of the Indian population – the tribals, the scheduled castes (once considered untouchables) and the others – normally referred to as the 'general' category. The analyses currently done do look at different categories – urban and rural, different regions or different occupational groups like cultivators, agricultural labourers and the non-agricultural workers. The analysis in terms of the scheduled tribes, the scheduled castes and the general or the non-scheduled components of the total population is absent.

Miller (1981) in her otherwise authoritative analysis of the juvenile sex ratios in India has explicitly opted out of this line of analysis and has instead taken up individual castewise analysis.[1] Two of the most recent and detailed reviews on this issue, viz, Chatterjee (1990) and Bennet et al (1991) do not cover this aspect either. A literature search between 1981 and 1991 also indicates that this line of analysis has not been pursued.

This omission is surprising because anyone familiar with the tribal Indian society cannot miss out its similarities with Boserup's 'female farming system'. These are high female labour participation, prevalence of shifting cultivation, late entry or even absence of plough and low level of monetisation of the economy. Boserup (1976) has herself pointed this out. She has also mentioned the scheduled castes as being major suppliers of casual labour and being 'unpropertied' class in Miller's terms [Miler 1981]. The supply of casual labour covers both agricultural and non-agricultural sectors. These are important respects in terms of which the ST and the SC populations differ from the 'general' population.

One would prima facie expect, therefore, a difference in the sex ratio pattern among these three groups. An analysis of the census date of three decades 1961 to 1991 indicates this to be indeed the case (Table 2). The female-male ratio (fmr) values expressed as number of females per thousand male population, are significantly higher for the tribal population and closer to the African ratios. This is followed by fmr values for the Scheduled Caste population, while the fmr values for the non-SC/ST population have been the lowest until recently. The difference between fmr values for SC and non-SC/ST or 'general' population has narrowed down during the last two decades.

The fmr pattern presented in Table 2, is both interesting and worrying. It also brings out the merit in disaggregation of the data in more than one ways. It allows one to compare the fmr data across the three socioeconomic groups, across different states and over the four decades, viz, 1961 to 1991.

The first feature to be noticed is that the problem of declining fmrs is more serious than envisaged so far for the 'general' category in a number of states and for the Scheduled Castes as a whole. For the scheduled castes the overall fmr declined further by three points during 1971-1981 when the overall fmr for the total population went up, even if temporarily. This decline is seen in almost all states including Tamil Nadu and Andhra. Only Himachal Pradesh and Punjab in the north, Kerala in the south, West Bengal, Assam and Sikkim in the east were significant exceptions. The decline was pronounced in the cowbelt Bihar, UP, MP and Haryana. It was also pronounced in Orissa as well. During 1981-1991 decade, the decline in fmr has been significant for ST population as well – from 983 in 1981 to 972 in 1991.

It needs to be stressed that the absence of such disaggregation had masked some of the drastic reductions in fmr that took place in the past. During 1961-1971 the declines in fmr values among some of the groups were as sharp as 50 females per 1000 males in Bihar, 32 females per 1000 males in MP, 23 females per thousand males in Orissa and 45 females per thousand males in UP. Hardly any attention has been focused on these sharp declines. Similar sharp declines have taken place during 1981-1991 also. Interestingly, wherever the fmr values for SC population have gone up, the 'general' category fmr values have gone up. But the converse is not necessarily true.

TABLE 1. SEX RATIO AND LIFE EXPECTANCY RATIO (Female/Male)

Missing Females

Another interesting way of looking at the same information is to calculate the number of missing females. If we take, say, the 1961 fmr (941) as the base fmr, then the number of missing females in, say, 1991 would be the number of women required to be added to the 1991 female population, so as to have the same fmr as in 1961. This number can be expressed as:

$$dw = [\text{fmr}(61) - \text{fmr}(91)] * M(91) \quad ...3.1$$

where M(91) is the male population of 1991 Census.

This is straightforward, as,

$$\text{fmr}(91) = W(91) / M(91), \text{ and,}$$
$$\text{fmr}(61) - \text{fmr}(91) = [W(91) + dW]/M(91) - W(91)/M(91) \quad ...3.2$$

Readjusting this we get the expression 3.1 above.

An exercise on above lines for 1981 shows the number of total missing females to be 31.24 lakh. The ST population accounts for only 3 per cent of this number. STs form about 7 per cent of the population. STs account for 29 per cent of the missing females although they make 14.6 per cent of the population as their share. The two figures for general category are 68 per cent and 78.5 per cent respectively.

The choice of an adhoc base, however, creates a problem in further disaggregation of the data. This is because the total fmr

$$F = W/M = \Sigma W(i)/M = \Sigma\{W(i)/M(i)\} * \{M(i)/M\} \quad ...3.3$$
$$\text{or, } F = \Sigma p(i) * f(i) \quad ...3.4$$

Where M(i) and W(i) are men and women in ith category and P(i) is the proportion of male population.

It is easy to see that further disaggregation would render

$$F = \Sigma p(i)*f(i) = \Sigma_{i,j} [p(i)*\ p(i, j).f(i, j)] \quad ...3.5$$

and so on where f(i, j) is the fmr for the jth subgroup of ith category and p(i, j) the proportion of male population of the jth subgroup to that of the ith category.

If we use the above expression into the expression for missing females, i e, in 3.3 above the disaggregation would become messy indeed. A simple way out of this would be to take the desirable or 'base' fmr to be unity or 1000 females per thousand men. In that event, the number of missing females dW = M – W; i e, the difference between the male and the female population would give the number of missing females. This expression lends itself immediately to further disaggregation, for,

$$dW = \Sigma dW(i,j,k...) = \Sigma\ [M(i,j,k....) - W(i,j,k...)] \quad ...3.6$$

where i,j,k... represent the progressive disaggregation into different relevant subgroups. One could now really play around with disaggregation as the reference fmr has been 'normalised' to unity.

Table 3 gives the estimate of the missing females statewise and categorywise arrived at in the above manner. It also shows the incremental increase in the number of missing females in successive decades. Tables 4.1, 4.2, 4.3 and 4.4 estimate this number for the 1991 census data. It also indicates the percentage contribution made by a particular state to the number of missing females in a given category to that at all India level. This is further compared to the share of population of that state to the all India population in that category. This helps one in getting some idea whether the state contributes disproportionately or otherwise to the number of missing females in a given category. Andhra Pradesh, for example, has 7.93 per cent of the country's population but its contribution to the number of missing females is hardly 2.95 per cent. U.P. on the other hand has 16.59 per cent of the country's population but contributes 28.14 per cent of the number of missing females.

In addition to this we also have to look at whether the fmr is declining or increasing in a given category and in a given state. Some states may be doing badly on all the three scores, e g, larger contribution to the number of missing females on all India basis in a given category compared to its share of population, larger contribution to overall missing female population in the state compared to its share in population and declining fmr. Some others may be improving in all three respects. For scheduled castes, UP provides the example of the former while Kerala provides an example in latter category. West Bengal on the other hand gives a mixed picture of high contribution to the number of missing SC females but steadily improving fmr.

The number of missing females has gone up from 133.52 lakh in 1961 to 318.49 lakh in 1991. However, the tribals who contribute about 8 per cent to country's population contribute about 3 per cent to the missing female population. The non-SC/ST category contributes disproportionately to it – about 79.3 per cent while its share of population is 75.4 per cent. The scheduled castes contributed 17.69 per cent to the missing female population as against their share of 16.5 per cent of the overall population.

If we notice the trend across time, the incremental increase in the number of missing females has gone up sharply in 1991. Further, the percentage contribution of the SC population to the missing female population is increasing while that of the 'general' category coming down. In fact, the picture becomes sharper in focus if we look at the addition to the number of missing females across 1971-1991 period. The contribution of ST, SC and general streams to this addition (66 lakhs) in 1971 was 2.3 per cent, 19 per cent and 78.8 per cent which changed to 5.6 per cent, 21.2 per cent and 73.2 per cent, respectively.

If we disaggregate the data at the state level, few more useful insights can be obtained. Different states contribute differently to the national aggregate and one can identify the major contributors or 'culprits' in a given category. The trend in fmr pattern in such states is also worth noting.

The ST population: Three categories of states can be mainly discerned on the basis of the fmr – the tribal majority states, states with significant tribal population, i e, Orissa

and MP and the 'mainland' states of Rajasthan, Gujarat, Maharashtra, Bihar, Andhra Pradesh and West Bengal. The former two categories have high fmr values but these are coming down at a rate which should cause concern particularly in MP and Orissa. The 'mainland' states show a sharper decline still and contribute significantly to the number of missing females. Rajasthan deserves particular attention in this context. With an fmr decline of 15 women per thousand men between 1981 and 1991 its contribution to the number of missing ST females has gone up to 20.57 per cent while its share of the country's tribal population remains only 8 per cent. If we look at the incremental increase in the number of 'missing females' between 81 and 91, we find that the four states of Bihar, MP, Gujrat and Rajasthan contribute to about 60 per cent to this increase.

The decline in the ST fmr values across the 1981-1991 period has virtually occurred in all the states and is in a sharp contrast with the trends between 1961 to 1981. This is a matter of worry and warrants further scrutiny

The scheduled caste population has witnessed a steady deterioration in the fmr values across all the regions Notable exceptions are Kerala, Himachal Pradesh, Punjab, West Bengal, Sikkim and Manipur. In general wherever the SC fmrs have gone up during a given decade the non-SC/ST fmr values have also gone up but not vice versa

The decline of the fmr in Bihar from 966 in 1981 to 914 in 1991 shows that there is something seriously wrong In fact, the trend across 1961 to 1991 shows similar decline: in 1961 Bihar had fmr of 1031 which declined to 981 in 1971 and further to 966 in 1981. This merits further attention as well as policy intervention.

As indicated earlier, the contribution of the SC population to the number of missing females is growing over the years. In absolute numbers it has moved from 14.25 lakh in 1961 to 56.35 lakh in 1991. In 1991 its percentage contribution to the total number of missing females was 17 7 while its contribution to the incremental increase was higher still, i e, 21.2 per cent. Of this incremental increase of 19.68 lakh, UP, Bihar and MP contribute about 58 per cent while their share of the country's scheduled caste population is 37 per cent .

If we look at the absolute figures for 1991, we find that UP alone contributes 34.11 per cent to the total number of missing females on all India basis. This is about 13 per cent in excess of its population share (21.2 per cent). Haryana, Punjab and Rajasthan contribute another 18.5 per cent while sharing only about12 per cent of the country's SC population. West Bengal and Madhya Pradesh contribute in large numbers but not disproportionately compared to their share of the population on all India basis. The southern states and Orissa contribute much less to the number of missing females compared to their share in the country's SC population. But as the fmr tables reveal, the fmr values for the SC population are going down in all these states except Kerala.

The 1991 Census data reveals a sharp increase in the number of missing females in this category Their number has gone up from 184.6 lakh in 1981 to 252.5 lakh in 1991. The incremental increase which had come down in 1981 (15.5 lakh) has jumped nearly four-fold to 67.88 lakh. Bihar and UP which share about 28 per cent of the country's non-SC/ST population contribute about 41 per cent to the number of missing females in 1991 Their contribution to the incremental increase is higher still and is over 47 per cent. These two states are singled out not just for the magnitude of their contribution alone but also for the declining trends in fmr. The decline in Bihar by about 32 females per thousand men across 1981-1991 period is rather serious Haryana, Punjab and Rajasthan again contribute disproportionately to the number of missing females compared to their share of population. The share of West Bengal is expected to steadily come down with improving fmrs and as indicated below, the figures would improve further if migration correction is made.

The Migration Effects

The above analysis of the sex ratios has to incorporate the effects of migration on sex ratios. FMR values will be higher if there is an outmigration of males or inmigration of females. Similarly, outmigration of females or inmigration of males will depress the FMR values. All the four types of migration occur in any region. As such one has to work out the net outmigration of both male and the female population for each state and add it to the enumerated population to arrive at the corrected FMRs. It is quite possible that different social groups exhibit different patterns of migration. This would necessitate a disaggregated analysis of the migration figures as well Some

Table 4.2 Missing Females, 1991

Pondicherry	3 42	3.35	0 07	86 82	0 03	0 11

useful observations could nevertheless be made.

The migration effects will be more pronounced as we go down from the national level to the regional, state, district and the village level. At the state level the effects are still insignificant as revealed by the 1971 census figures (Table 5.1). Inter-state migrations hardly involve 3 to 3.5 per cent of the total and 10 to 15 per cent of the migrant population. Major migration takes place within the states.

Among different states, Maharashtra and West Bengal have traditionally attracted migrants from other states for occupational reasons. In these two states the migrant population accounts for 6.41 and 4.72 per cent of the population of the State, respectively. Haryana (8.54 per cent) and Punjab (4.32 per cent) are the other two states with high migrant population. This is mainly on account of the agricultural prosperity following the green revolution. Madhya Pradesh is the only other non-border state where the migrant population accounts above 4 per cent of the population of the state.

A preliminary study of the effect of migration on FMR for different states was done for the total rural population (Table 5.2). The total population was taken for the analysis as the disaggregated data for migration in terms of the ST, the SC and the general categories is not readily available. The population of the state was corrected for by adding the figure for the net outmigration separately for the male and the female population and the corrected FMRs were worked out. The expression for the corrected population is thus:

$$CP = EP + Out - In$$

where CP is the corrected population, EP is the enumerated population, 'out' is the outmigrating population and 'in' the inmigrating population.

A comparison of the fmrs for different states with the corrected fmrs shows marginal changes in the fmr values. However, there is a significant improvement in the fmr for both Maharashtra (965 to 993) and West Bengal (942 to 978), respectively. For Madhya Pradesh the improvement is marginal (956 to 961). All the northern states of UP, Rajasthan, Punjab, Haryana and Himachal Pradesh show a decrease in the fmr. The decrease for Bihar (971 to 952) is quite significant and it would be interesting to study the categorywise breakup. There is a likelihood of significant outmigration of tribal males from Bihar which may account for the high fmr for the tribal population.

Kerala is the only southern state where the corrected fmr drops appreciably from 1020 to 1005. But this is consistent with the known and traditional male outmigration from Kerala. While a disaggregated analysis of the migration figures and necessary migration corrections are needed to be made one can expect that the picture would change only marginally in most cases. These changes would certainly not account for the trends in the fmr and the number of missing females observed above.

This analysis establish the usefulness of disaggregation while analysing the observed sex ratio imbalances in India. It also presents a simple and useful method of analysing the problem by unpacking the missing females issue through equation 3.6.

The above disaggregation prioritises the areas needing remedial intervention and suggests that it has to be designed differently in different parts of the society. Tribal Orissa for example, would require different intervention compared to, say, the 'developed' Haryana. In areas where fmrs are already favourable, the intervention should aim at consolidating the position. On the other hand, where the fmrs are low and deteriorating, immediate corrective interventions, e.g. improvement in girl child's access to nutrition and female literacy.

campaign would be called for. Areas where the fmrs are low but improving the measures already taken should be accelerated.

While a detailed discussion of the interventions and their design would be outside the scope of this presentation; two observations can be made. The author has elsewhere analysed the 71 census data in more details and has examined the link between fmr and flp. The significant differences between the three sociocultural groups, i e, the ST the SC and the 'general' population are in conformity with above analysis. However, the flp emerges as a dominant variable in determining the fmr. The implications of these findings are that creation of opportunities for female labour participation in productive activities and ensuring the female's control over the income thus generated will be the immediate need in areas of low and deteriorating fmrs.

The second issue relates to further disaggregation of the missing female patterns. The analysis of 1971 census data referred to above indicates that agricultural labourers, cultivators and non-agricultural workers also exhibit important differences between themselves within each of the above categories. The magnitude of the problem of sex ratio imbalance among these subgroups will warrant further scrutiny.

Conclusion

It will be ambitious to draw detailed conclusions at this stage of the analysis. But it is clear that the problem of sex ratio imbalance in India needs a disaggregated analysis. It is also clear that the absence of such analysis masks the seriousness of the problem among certain groups and also in certain areas. This has perhaps been the reason why fmr deteriorations as sharp as 50 women per thousand men during different decades in some of the states, failed to attract policy or academic attention. The decline in fmrs revealed in 1991 necessitates that such attention is focused on the major problem areas. Such problem areas can be identified with the help of the data presented here and through further disaggregation among various subgroups. We already notice that the northwestern states of India exhibit an adverse trend towards female survival. It can further be seen that such a trend is making inroads in other parts of the country, as well. Certain regions also stand out for not succumbing to this trend. The strategy for improving the declining fmr trend will differ between these two regions. That would be the objective of the next stage of this analysis.

Economic Reforms and the Rural Poor

S Mahendra Dev

BOTH the critics and supporters of the economic reform now agree that the poverty has increased during the first 18 months (July 1991 to December 1992) of the reform period. They disagree, however, on the factors responsible for the increase in poverty, particularly rural poverty.

A recent paper by Tendulkar and Jain (TJ hereafter) published in *EPW* (June 10) examined the factors responsible for the rise in poverty and their links with the reforms. They first present three measures of poverty (head count ratio, poverty gap index and FGT index) for both rural and urban areas for the period 1970-71 to 1992 and discuss the proximate factors responsible for increase in rural poverty in the post-reform period. They have used two alternative poverty lines. According to their estimates, head count ratio (HCR1) for rural areas increased significantly from 36.55 per cent in 1990-91 to 42.06 per cent in 1991 (July-December) and to 48.07 per cent in 1992. There was also a significant rise in the severity of poverty. Urban poverty increased marginally during the same period. According to TJ, "the accentuation of rural poverty during the National Sample Survey periods of 1991 (July-December) and 1992 (January-December) can be seen to be a combined consequence of the natural forces, constricted manoeuvrability of government action, political factors and only *indirectly* certain decisions relating to the economic reforms since July 1991." Their clear conclusion is that "economic reform-related decisions contributed indirectly rather than being the only or even the major cause of the sharp accentuation of rural poverty during the period under consideration" (p 1377). The purpose of my note is to (a) provide a different interpretation to the factors mentioned by TJ; (b) highlight that fiscal compression could be the main reason for not undertaking relief works at state level (or the 'constricted manoeuvrability' mentioned by TJ) in a "below normal agriculture year"; and (c) indicate that any decline in social consumption (as opposed to private consumer expenditure) could be attributed mainly to reforms during the post-reform period.

At the outset it may be mentioned that this note has a limited purpose of addressing the question, namely, whether reforms were responsible for increase in rural poverty during the 18-month period July 1991 to December 1922. It does not address the counterfactual questions like what would have been the situation without reforms or the issues relating to the medium- and long-term implications of the reforms for growth and equity.

Before going to the specific comments, I have two general comments to make on the patterns of poverty ratios and on reforms.

(a) Some patterns can be seen from the two alternative poverty ratios given by TJ. For want of a better term I call the lower end poverty ratio as the ratio for 'ultra poor' or 'ultra poverty' Table 1 shows that the ratio of ultra poverty (HCR2) to the total poverty ratio (HCR1) declined gradually over time. In other words, the rate of decline in ultra poverty has been faster than the total poor. But the ratio increased again during the 18 months of the reform period. For urban poverty, there was a marginal increase in this ratio in the 18 months as compared to the years 1989-90 and 1990-91 For rural poverty, increase in the ratio was true even for FGT Index

(b) A few words on reforms are in order The impact of economic reforms on poor in India so far has not been as bad as in the Latin American countries On the other hand, it has not been as favourable as in some of the East Asian countries [Rao 1995]. During the first few years of the stabilisation period it is expected that the reforms would have adverse impact on both rural as well as urban poor although the reforms are mainly targeted to the organised sector Two World Bank economists [Ravallion and Subbarao 1992] have argued that in the short run, the adjustment process would affect the poor adversely because the costs would be felt quickly whereas the benefits would take time to materialise. Therefore, it is the responsibility of the government to take care of the poor as far as possible by maintaining the social sector expenditure during the adjustment period This is important even for the success of the reforms. The reform process does not seem to be reversible irrespective of the government that comes to power in 1996 elections. Therefore, it is important to know the costs of adjustment.

Coming to the main issue, my comments on TJ's paper are the following:

(1) It is true that, as TJ indicated, so far the reforms have been mainly limited to the urban organised sector. Therefore, according to them, the rural sector would not be affected directly by the reforms. This point was made by many others. I digress a bit here from TJ to Bhagwati and Srinivasan (1995) who, in response to the statement of 13 economists, say that "since the reforms did not extend significantly and in a direct way to agriculture and to rural non-agricultural activities, it is unlikely that they, in themselves, could have contributed to an increase in unemployment and poverty if indeed there was any". However, according to me, the reforms have considerable direct and indirect (and positive and negative) impact on rural areas. First, it was expected that reduction of industrial protection and devaluation would benefit the agriculture sector. On the negative side, a cut in fertiliser subsidy and public investment would affect the agriculture sector

TABLE 2 DETAILS OF EMPLOYMENT, 1989-90 AND 1992
(Millions of Persons, usual status)

adversely. Similarly, increase in issue prices for PDS (as part of the reform process) would also have affected the rural poor. The reforms in industrial sector might have directly affected non-agricultural activities (which are not insignificant) in rural areas. As TJ admitted, the cuts in public investment and social expenditure directly affect the rural areas. For framing economic policies, it makes some difference whether the reforms have direct or indirect effect on rural poverty. But for the poor it does not make much difference. Coming back to Bhagwati and Srinivasan (1995), they also say that "the overwhelming majority of the labour force in India is employed in agriculture and the dominant mode of employment is self employment and not wage employment. Unemployment is not a well defined concept for the self-employed". It may be noted that for many self-employed, secondary activity may be wage employed and thus person days would be affected as opposed to persons. Even self-employed persons like rural artisans and other household industry might have been affected. I, however, partly agree with Bhagwati and Srinivasan when they say that before and after comparisons of reforms on unemployment, poverty and growth have problems.

(2) It is by now well known that changes in agricultural growth and rural prices (particularly foodgrain prices) are the important determinants of changes in rural poverty. However, what is not well known is the importance of public action in influencing the changes in rural poverty. TJ mentioned the importance of public distribution system and employment programmes in the drought year 1987-88. These factors are discussed below.

(2a) *Agricultural Growth.* I believe that agriculture growth is very important for rural areas for not only increasing production but also for income generation to the labourers in the form of employment and wages and its linkages with non-agriculture. Its indirect impact to prices is also quite high. Growth has to be, however, relatively high to make an appreciable impact on the poor. Commenting on the trickle down hypothesis of Ahluwalia (1978), Srinivasan (1985) considers that the results should be interpreted with caution since there was very little to trickle down at the all-India level. In the 1980s, there was slightly higher growth in agriculture as compared to the 1970s. During the period 1981-82 to 1991-92, foodgrains growth rate was around 2.9 per cent and overall growth was around 3.4 per cent per annum. It was also a broad-based growth with West Bengal recording the highest growth in foodgrains. However, there are constraints to agriculture growth in some states and every state cannot have a Punjab type high growth. Therefore, there is a need for public action till non-agricultural growth absorbs the labourers productively. Turning to 1991-92, it is true that rainfall was below normal in many regions in this year and it affected agricultural production. In several states, coarse grains production declined. It may be, however, noted that rice and wheat production also declined. The decline could be partly due to decline in fertiliser consumption which in turn was due to increase in fertiliser prices. This could be attributed to the reforms. Gaiha (1994) has shown that fertiliser consumption per hectare declined in 1991-92 in Andhra Pradesh and Maharashtra.

Secondly, it is interesting to note that in spite of decline in agricultural production, even the share of agriculture employment in total rural employment (usual status) has not declined during 1991 and 1992 (more on this later). Also, we do not know how much impact the decline in coarse cereal production would have on the consumption of the poor. Even in the 1980s, there had been a shift from coarse cereals to fine cereals even in the coarse grain producing states. It is true that this shift increased the cost of calories.

(2b) *Foodgrains prices*: One of the major reasons for increase in rural poverty could be the increase in procurement prices. It is true that farm lobbies were responsible for the rise in these prices. It, may, however, be noted that part of the blame should go to reforms (I am not attributing everything to reforms). Similarly, the expectations of the traders regarding prices could have increased after the reforms. It is probably similar to the organised sector's expectation of high salaries in the post-reform period. As mentioned by TJ, devaluation and reduction in fertiliser subsidies led to increase in procurement prices. Therefore, reforms might have triggered the intensification of the demands of the farm lobbies and expectations of traders. Increase in issue prices of PDS would have also affected the purchasing power of the rural poor (more on this later).

(2c) *Employment*: TJ have not talked about the employment growth based on NSS data during these 18 months of reform period. Chandrasekhar and Sen (1995) looked at the industrial distribution of workforce for the years 1989-90 and 1992 based on NSS data. Since daily status details are not available, they looked only at usual status employment. This may have some biases because a person works in different activities (agriculture, non-agriculture) in a year. However, the information given for the employment by occupational classification in Table 2 shows that employment for agricultural classes did not show any decline whereas non-agricultural employment went down significantly between pre- and post-reform periods. Similarly, the sectoral shares given in Table 3 for the period 1977-78 to 1992 shows that the share of primary sector increased in the post-reform period as compared to pre-reform period for both males and females. These results indicate that in spite of reduction in agricultural production in the post-reform period, employment (in terms of usual status) has not declined in the primary sector. The stabilisation policies could be responsible for the reduction in employment in non-agricultural activities [for more on this see Chandrasekhar and

Concept

INFORMATION INDIA : 1992-93

Global View

S.P. Agrawal and J.C. Aggarwal

(538-8) Hardbound Rs. 500

Although the focus of this volume is on India of 1992-93, it provides useful overview of significant development that took place in the world as a whole. A comparative study of indicators of development with regard to 170 countries has been included. An attempt has been made to provide almost all embracing facts and figures with regard to various factors of development in India since 1947.

Dr. S. P. Agrawal is the former Member-Secretary, Indian Association of Social Science Institution.

J.C. Aggarwal is the former Executive Director, Delhi Bureau of Textbooks, Delhi Administration.

Publishers: Ph.: 5554042, 5504042

Sen 1995]. Also, Sen (1994) indicated that government expenditure was responsible for the growth of rural employment, particularly non-agricultural employment, during the 1980s. Absence of the government expenditure in non-agricultural activities could be partly responsible for the decline in rural non-agricultural employment and income.

(3) *PDS: Urban Bias and other issues*: TJ commented that PDS is predominantly urban oriented programme. Further they say that "...the increase in CIP were more relevant for the urban poor and the urban population in general with the univeral (untargeted) urban public distribution system" (p 1377). This was true in the 1960s and 1970s. During this period, it was limited to a few southern states and urban metropolitan areas. Even the study of Howes and Jha (1992) which showed that there was urban bias indicated a considerable reduction in urban bias between 1979 and 1986-87. There are, however, significant inter-state disparities in the allocation of foodgrains. For example, the Bihar, Madhya Pradesh, Orissa, Rajasthan and Uttar Pradesh (BIMAORU) states have been getting very little allocations compared to other states. Urban bias is only in a few states (e g, West Bengal) and few commodities. On the other hand, some other states have rural bias in PDS (e g, Andhra Pradesh). Some studies done by the Commission for Agricultural Costs and Prices (CACP) have also shown that there is very little urban bias in PDS. It is true that delivery systems and infrastructure are poor in rural areas. So the impact of PDS on rural puchasing power may be lower than urban areas. TJ assume that urban areas have absorbed the foodgrains from PDS during the post-reform period. Is there evidence on this statement?

It is a different matter that, as shown by some researchers, the impact of PDS on poor is marginal and it is not cost-effective as compared to other programmes like public works. The present PDS also has some other problems [for example, see Parikh 1994' for other problems, see Dev forthcoming]. It may be noted, however, that the problems in PDS may affect both rural and urban areas more or less equally.

According to TJ, one of the reasons for the increase in rural poverty in the post-reform period could be the reduced manoeuvrability of government action due to considerably depleted public stocks. It may be worth noting here that during the severe drought of 1987-88, the offtake under PDS was around 19.5 million tonnes. As shown in Table 4, the offtake (rice and wheat) during 1990-91, 1991-92 and 1992-93 was 14.97, 18.72 and 16.77 million tonnes respectively. The point to be noted is that the offtake for PDS was much higher in 1991-92 and 1992-93 (which are relevant for us) as compared to a normal year 1990-91 although it was lower than that of drought year like 1987-88. It is true that availability of more foodgrains under buffer stock could have made some improvement in the purchasing power. But the recent experience shows that even the high bufferstock (about 37 million tonnes now) does not guarantee increase in offtake if the difference between open market prices and issue price is not significant.

(4) *Poverty Alleviation Programmes*: TJ admit that the "the squeeze on the central anti-poverty programmes during the fiscal compression can be directly attributed to economic reforms" (p 1377). But, according to them, the importance of this factor is tempered by three factors: (a) the central government programmes would not have prevented sharp increase in rural poverty because of their limited scale; (b) limited effectiveness of these programmes due to problems of organisation and delivery systems; and (c) drought-relief works in 1987-88 were much more effective than central programmes.

I will take up the last point first. In 1991-92, weather effect was mainly on north and western states. In the northern states there was not a significant problem because of irrigation. In 1987-88, as mentioned by TJ, some states undertook drought-relief works and that prevented (combining with PDS) the rise in poverty. My point is why did the state governments not undertake measures to help the poor in 1991-92? Was it because the centre declared it as 'meteorologically normal' year? or because the funds were not available due to fiscal compression and decline in the allocation of funds to states? or because the bufferstock was not available for relief works? For me, it looks like the fiscal problems due to reforms could be the main reason for not undertaking relief works in different states. For example, in Maharashtra, the index number of foodgrains declined from 184.5 in 1990-91 to 128.6 in 1991-92. The expenditure under Employment Guarantee Scheme did not show any increase in real terms. On the other hand, there were some attempts to divert the funds (probably to meet the non-plan expenditure in the budget!). My hypothesis is that had there been efforts by the state governments as well as the centre to increase the purchasing power of the poor through anti-poverty programmes, probably rural poverty would not have increased. With the relatively high purchasing power, rural poor could have purchased even the PDS grains. The state governments and the centre did not undertake these programmes because of the fiscal compression due to reforms.

It is true that there have been many leakages and other problems in anti-poverty programmes in India. For example, the Concurrent Evaluation of JRY (January-December 1992) showed that more than 50 per cent of the workers working under JRY were *non-poor* (Table 5). It is also true that these are relief programmes and only economic growth can provide productive and sustainable employment. It does not, however, mean that anti-poverty programmes cannot make a significant dent on poverty. Although TJ do not deny the importance of these programmes, they say that central programmes could not have prevented sharp increase in rural poverty. My point is that maintaining the expenditure under central programmes could have at least prevented certain sections of the population falling below the poverty line.

A short digression: (a) One cannot reduce the leakages in anti-poverty programmes completely. It can be minimised with better administration. For example, in some programmes, the leakage can be reduced from 85 per cent mentioned by Rajiv Gandhi (this was quite high and exaggerated) to 30 to 40 per cent level. It may be noted, however, that fine tuning of targeting programmes are also harmful to the poor. I G Patel has once commented that in some cases it is cheaper and simpler with leakages rather than

TABLE 4: FOODGRAIN OFFTAKE UNDER PDS

targeting [also see Sen 1992]. Supporters of these programmes say that leakages are everywhere in the society. We have also leakages in the growth-based programmes. For example, irrigation projects in India may have large leakages.

(b) Anyway, in the absence of higher growth and imperfections in markets, poverty alleviation programmes are important. Even employment creation through market mechanism would be costlier in the short run as compared to government programmes. In 1990-91, Rs 30 were spent in generating one day's employment under JRY in Maharashtra. GOI (1992) quotes a rough estimate made by Subbarao for normal developmental activities in 1986-87. According to this estimate, Rs 64 is needed for generating one day's employment via normal developmental activities in 1986-87 [see GOI 1992]. Tendulkar (1992) discusses the importance of the direct attack on poverty in the light of the barriers to income mobility for the poor, particularly for the virtually assetless poor. In the absence of significant redistributive measures as happened in East Asia, Indian poverty alleviation programmes can also be considered as programmes that change the structure of income distribution. Of course, one has to distinguish between populist programmes and other programmes [Rao 1995]. The protective social security schemes are equally important. "Studies point out that 60 per cent of the total disabilities occurring in India can be prevented if expectant mothers receive proper nutrition and care" (*The Economic Times*, July 25, 1995). There is certainly a need for improving the efficiency of the government programmes [Dantwala 1983]. Regarding organisational and delivery systems for poverty alleviation programmes, institutional reforms may be needed for implementation in order to reach the benefits to the poor effectively.

(5) *Social Consumption*: It is known that total consumption of a person or household consists of private consumer expenditure and social consumption. TJ's concern in their paper was mainly on private consumption. It is difficult to get information of social consumption at the household level. However, many studies have shown that social sector enpenditure declined considerably during the first few years of the reforms period [among others, see Gupta 1995, Guhan 1995, Prabhu 1994, Tulsidhar 1993]. These studies have shown that expenditure on health and education and other sectors have declined and it could affect the human development indicators. Decline in expenditure on important components of health sector, namely, preventive health care, was also noticed. I attribute any decline in social consumption mainly to reforms.

The above interpretations regarding the impact of reforms on the rural poor can be summarised as in Table 6.

To recapitulate, the interpretations mentioned in this note indicate that the increase in rural poverty indicators (based on private consumer expenditure) in the post-reform period was more due to the direct and indirect impact of reforms as compared to factors like weather and farm lobbies. One of the main factors could be the inability of the states and the centre (due to fiscal compression) to undertake relief works in order to increase the purchasing power of the rural poor. In other words, the 'constricted manoeuvrability' mentioned by TJ could be attributed to the reforms. Any decline in social consumption indicators could be mainly due to reforms. I have not discussed here the counter factual qestions like what would have been the situation without reforms and the issues such as the impact of economic reforms on poverty in the medium and long-run or the trade-off between the short and long run.

TABLE 6. IMPACT OF REFORMS ON RURAL POOR

Due to Reforms (Directly)	Due to Reforms (Indirectly)	Not Due to Reforms
Decline in rural non-agriculture employment and income	Increase in the expectations of traders and farmers regarding prices	Weather factor. Only 68 per cent and 65 per cent of districts had normal/excess rainfall in 1991-92 and 1992-93 respectively
Decline in fertiliser subsidies	Increase in the issue prices of PDS	
Reduction in central expenditure anti poverty programmes	Inability of the state governments to undertake relief works to increase the purchasing power of the rural poor	Part of the excess increase in procurement prices could be attributed to farm lobbies
Decline in expenditures on sectors which improve social consumption	On the positive side, decline in industrial protection and devaluation were expected to shift the terms of trade towards agriculture. Devaluation can also have negative effects in the short run. For example, in some states, area under foodgrains were shifted to non-farm activities for export purposes.	Lower level of buffer stock compared to the optimum level (this could be partly due to weather factor)

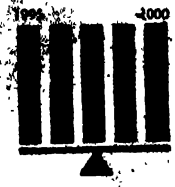
Shri Manohar Joshi
Chief Minister

Warm Greetings to the people on the 47th Anniversary of the Indian Independence

Inspired by the ideal of
Shri Chhatrapati Shivaji Maharaj
to bring Surajya, the Shivsena-BJP
Alliance marches on to fulfil
its commitment to people. . . .



Shri Gopinath Munde
Deputy Chief Minister

As promised, White Paper brought out on drinking water. Decisions taken to set up Water Resources Authority under the Chairmanship of the Chief Minister and to create a separate Department in Mantralaya for the same.

250 Zunka-Bhakar Centres opened in the State to provide meal for the poor.

Decision to stablilise prices of five essential commodities distributed through PDS for the next five years brought into effect from June 1, 1995.

All enactments in Marathi from the Independence Day.

Scheme to provide free houses to 40 lakh slum-dwellers in Mumbai formulated for launching on Dasera Day.

Foreign investment proposals worth Rs.14,000 crore received. Maharashtra retains its leadership in Industry in the country.

'Enron Project', which was against the interests of Maharashtra, scrapped.

"Nav Sanjeevan" and "Dhanyakosh" schemes for Adivasis, "Kamdhenu" scheme for handicapped, destitute and needy women and "Ekalavya" scheme for economically backward students introduced.

Directorate General
of Information and
Public Relations,
Govt. of Maharashtra.

Well being and Prosperity of the people is our firm resolve.

YOUR ALL TIME FAVOURITE

UTI'S MONTHLY INCOME PLAN '95-II

MONTHLY OPTION

13.5% p.a. minimum targeted dividend payable monthly for the first year. Dividend for the subsequent years will be announced before the end of the preceding year.

FEATURES : ■ Close ended 5 year plan with 2 options ■ Repurchase under both the options after the first year at NAV based price ■ Scope for capital appreciation. ■ Face Value : Rs 10/- per unit, sold at par Minimum Investment 200 units and in multiples of 100 units thereafter No maximum limit Exemption from Income Tax upto an overall limit of Rs 13,000/- under section 80L of the I T Act, 1961 ■ Deduction of tax at source from dividend income as per the Finance Act 1995 ■ For availing facility of non deduction of tax at source, prescribed Form No 15H may be furnished as per the relevant Rules

CUMULATIVE OPTION

Returns will be cumulated and distributed as capital appreciation on maturity.

Switch-over facility from Mastergain '92 to MIP '95-II

(Within the overall limit of 25% of original capital to be redeemed)

UNIT TRUST OF INDIA

For your better tomorrow

Plan open : Aug 7th to Aug 28th '95

ADROIT 589

All investments in mutual funds and securities are subject to market risks and the NAV of schemes may go up or down depending upon the factors and forces affecting securities market. Past performance is not necessarily indicative of future results Monthly Income Plan '95-II is only the name of the plan and does not in any manner indicate either the quality of the plan, its future prospects or returns There can be no assurance that the Fund's objectives will be achieved. In the event of actual income not being sufficient to pay a minimum targeted return of 13 5% p a members may suffer loss of unit capital to that extent. Please read the offer document before investing.

Indian Industry under Liberalisation

The Indian computer industry has come a long way since its total reliance on imports from a few multinationals in the 1960s. However, the current round of import liberalisation is producing an increasing number of features redolent of that earlier period. **M-82** The experience of the computer hardware industry holds important lessons for the success of the shift in the government's role from doer-controller to facilitator-intervener *vis-a-vis* industry. **M-94** An empirical evaluation of the performance of the cement industry during the various phases of control and decontrol can provide major inputs for the ongoing debate on whether economic liberalisation will significantly contribute to industrial growth and efficiency. **M-111**

Colonial Policy and Communalism

In the study of communalism, the colonial policy of separate electorates for religious minorities has been put forward as a powerful explanatory factor. A comparison of British India and the princely states of Baroda and Travancore suggests that such arrangements had much less influence on the formation of communal identities than has generally been assumed. **2123**

Institutional Change and Farm Productivity

West Bengal is the only state which has for the last nearly two decades been operating a system of democratically elected local self-government. It has also successfully carried out certain land reform measures. What has been the impact of these institutional changes on agricultural productivity? **2134**

Emperor's New Clothes

In the large-scale reorganisation of the power and telecom sectors now under way, the overriding consideration is that of making private investment attractive. Concern for consumers is not on the agenda. **2114**

Not the Whole Story

Ecological economics' concepts of scale, uncertainty and ecosystem health have to be central to decisions on and evaluations of large infrastructure projects. Disregard of these factors in regard to the Narmada Valley project invalidates many previous analyses which have typically relied on traditional cost-benefit analysis. **2138**

Economic Reform and States

While the broad industrial policy framework is formulated by the central government, it is the state governments that can influence the strategic location of new investments and the associated pay-offs. What are the critical policy issues in relation to industrial liberalisation at the state level? **M-117**

Towards Beijing

While international conferences, such as the Fourth World Women's Conference in Beijing, make possible the thematic documentation of crises in human and social development, they also lead to an avoidance of any critical evaluation of the development processes which led to the crises. **2102**

No Panacea

Flexible specialisation is characterised as a single model with a definite set of labour consequences, whereas the reality is much more varied. In developing countries flexible production and organisation of small firms is in fact a survival strategy of enterprises struggling for a market niche which does not attract the larger companies. **M-124**

Forest Management

While joint forest management is a step forward from centralised state-controlled management systems, is it as participatory and decentralised as it is claimed to be? The experience of Tamil Nadu **2110**

Double Jeopardy

The Kashmiri people and their demand for 'azadi' are caught between the Indian army's operations on the one hand and those of so-called 'guest militants' determined to convert a national movement into a religious war on the other **2105**

Lessons from East Asia

Trends in the flow of direct foreign investment into east Asia hold interesting pointers to how the Indian government should frame its strategy to attract foreign investment. **2112**

LETTERS TO EDITOR

Technology Development in Fertiliser Industry

I WAS resisting my temptation to intervene in the Sudip Chaudhuri-Ramaswamy Iyer debate on the developments in the Indian fertiliser industry in the 1960s and the 1970s, but since (May 28, 1994, August 20, 1994, April 29, 1995 and June 24, 1995) Iyer has made an attempt to obfuscate the issues by referring, above all, to the "appreciative letters" he has received in support of his position, I felt prompted to respond. I have long worked on the Indian fertiliser industry and having gone through the material during the period when the decision regarding the 1,350 tpd ammonia plants were being taken, which incidentally was during Iyer's tenure as the financial adviser in the ministry of chemicals and fertilisers, I can provide some vital facts that Iyer has preferred not to mention

One of the most glaring omissions in Iyer's interventions was the absence of any reference to the Sethna Committee report (chaired by H N Sethna, then chairman of the Atomic Energy Commission) that considered the working of the three engineering design organisations involved in the Indian fertiliser industry, viz, P and D division of the FCI, FEDO of the FACT and the EIL. This report was never made public. Iyer could possibly provide the reasons why the report was kept secret. But what is important in the context of the Chaudhuri-Iyer debate is that the Sethna Committee had argued that EIL should not have been in the business of setting up fertiliser plants in the country The Bechtel Corporation-supported EIL was thrust upon the fertiliser industry even when two public sector organisations, P and D and FEDO, were long involved in setting up plants largely based on expertise available locally. Thus, instead of allowing P and D and FEDO to hone up their skills, it could be said that EIL was introduced to dissipate the efforts of the organisations that were involved in developing indigenous technology.

The Sethna Committee's arguments, it needs to be pointed out, centred around strengthening of the P and D division of the FCI. Standardisation of plants (both ammonia and urea) was among the foremost suggestions made by the Sethna Committee to make the P and D division more efficient as an engineering design organisation. It is in this context that the points raised by Chaudhuri regarding the implications of setting up of the 1,350 tpd ammonia plants become relevant, and he is quite justified in questioning the veracity of the decision in favour of the larger-sized plant. 900 tpd ammonia plants were then the size that P and D division was capable of handling and this size should have been adopted as the standard. There was no need to scale up the ammonia plant to 1,350 tpd particularly when this larger-sized plant gave no clear operational cost advantages. On the contrary, it could be argued that the 1,350 tpd plants could not be adopted as a standard size because several regions of the country did not have the infrastructure to transport the over-dimensioned equipment required for this size of plants. The decision in favour of the 1,350 tpd ammonia plants was nonetheless taken, but in all this the ultimate loser was the P and D division of the FCI, which had by then been made a separate company as the FPDIL. This was the last nail in the coffin of the efforts to develop indigenous technology in the Indian fertiliser industry. Iyer could refer to the article I had written in the Annual Number of the *EPW* in 1984 dealing with the above mentioned issues.

Iyer's own role in the process of downgrading of the achievements of the P and D division deserves mention. The issue of time and cost overruns in the projects P and D division had handled was studied by an independent organisation, the Institute of Financial Management and Research (IFMR). Although the report was unable to fix the responsibility for the overruns conclusively on the P and D division, the report was nonetheless used to flog the organisation. This report was given undue importance by Iyer in his capacity as the financial adviser of the ministry. A note was circulated by him that even I could lay my hands on! And all this he did while the Sethna Committee report gathered dust and which, as I mentioned before, was arguing for strengthening of the P and D division, and therefore of the indigenous efforts at technology development in the Indian fertiliser industry.

BISWAJIT DHAR

New Delhi

Fudged Statistics

KALIMUDDIN SHAMS, West Bengal's minister for agricultural marketing, informed the state assembly on July 24 that the prices of potatoes and vegetables – in which West Bengal is a surplus state as per the state government's statistics – were rising because of the centre's restriction on export and non-availability of infrastructural facilities for storage. This statement betrays the utter idiocy of ministers – whether of the left or right variety – in today's Indi Rising prices despite surplus production also raise serious questions about the quality of statistics of the West Bengal government. A few months ago, due to floods in some neighbouring states, trucks carrying fish did not arrive from some southern states leading to a sudden jump in fish prices by more than 50 per cent. Finding no buyers for such costly merchandise, fish stalls in the market remained closed for nearly a week. All this happened in Calcutta proper where the people have relatively good buying-power and in a state which has had the highest production of fish for some years. Comments about the West Bengal government's fudged statistics that appear occasionally in the 'Discussion' columns of the *EPW* are well taken.

ECONOMIC AND POLITICAL WEEKLY

Back to the Roots

IN Beijing next week, more women will be talking the same language and sharing the same idiom and grammar than ever before in articulating a women's perspective and reviewing the tremendous changes in the decade following the Nairobi Conference on Women. And as never before in the history of the modern women's movement, they will be confronting and challenging the limits of accommodation possible within the dominant world order structured by the neo-liberal economic paradigm.

While gender disparities are pervasive and, as the *Human Development Report* 1995 suggests, persistent, some indices measuring social change with regard to women have shown considerable and consistent improvement in most countries. However, the progress towards women's equality appears to slow down in proportion to its costs to the state in terms of the economic, political and social change required to engender such change. Between 1970 and 1990 life expectancy rose 20 per cent faster for women than for men; in adult literacy and school enrolment, the gaps between men and women have been halved; and female literacy rates are now closer to men's. Primary school enrolment of girls in developing countries has risen by 1.7 per cent a year during 1970-90, showing a higher rate than for boys.

The snapshot of women's health status is not so bright. Infant mortality rates, the reduction of which is directly related to the lowering of fertility rates and increasing contraceptive prevalence, have declined. The one has fallen significantly and the other has risen, whereas maternal mortality rates, which reflect the status of investment in infrastructure, have shown remarkably small declines in developing countries. Shockingly enough, 46 per cent of all maternal deaths occur in the three countries of the Indian subcontinent, India, Bangladesh and Pakistan. Significantly, comprehensive data on women's health and their access to health care facilities continue to be unavailable, hiding the lack of progress in the area. There is evidence, for instance, that malnutrition affects women more than men: according to the *HDR 1995*, 458 million women suffer from iron deficiency while only 238 million men are so affected. Similarly, protein energy malnutrition severely affects women more than men and is estimated to be the cause of 3,00,000 deaths among women in the age group 15 to 59 in developing countries. But there is little information on how many more women die of communicable diseases, whether more women are affected by these diseases or die because of neglect, how badly women are affected by gender-biased medical systems and on investment patterns in health care for women.

Even more stark is the evidence on women's economic situation. Poverty, as the *HDR 1995* puts it, has a woman's face. More than 70 per cent of the 1.3 billion people living in poverty are women and the number of rural women living in absolute poverty rose in the last two decades to 50 per cent. Women's labour force participation has grown by a meagre 3.9 percentage points in the last two decades, bringing the rates nowhere near the 58 per cent for men in 1990. According to the *World Development Report 1995* (WDR), however, in many countries – 30 of the 45 low income countries – the female share in the labour force has actually fallen: in India from 30 per cent in 1970 to 25 per cent in 1990.

There are far more women 'unemployed' in the sense of those who seek employment and do not find it. There has been hardly any progress in providing work-related welfare measures such as child care facilities, maternity benefits, social security, etc. While women constitute 80 per cent of food producers, few countries have legislated to protect their right to the land that they till. The one sector where women's participation has risen, and sharply, is the informal sector, which includes home-based production as well as small and cottage industries and trade and service occupations. This is also the sector which has the poorest working conditions and is the most ill-legislated, ill-monitored.

Are women's rights today better protected and more uniformly institutionalised? Though the Convention on the Elimination of All Forms of Discrimination against Women (CEDAW) has been signed by 139 countries, only 41 have ratified it, with the result that even in countries where, for instance, educational and other opportunities have been opened up for them, women may not have the right to manage property, to land, or to travel or even to access income-earning opportunities. And not surprisingly, there continue to be only a minuscule number of women in decision-making bodies, in parliaments or in administrative structures.

In other words, change or 'progress', it would appear, has occurred in those areas where, for one, the least disturbance has taken place in conventional structures, and for another, the state has had an associated pay-off, with least effort, as for instance in education because of the demonstrated connection between female literacy and the all-important goal of fertility reduction. As has been evident, the change in attitudes manifested in families allowinwg female children to enrol in schools and in the state providing such facilities becomes irreversible and a step towards the breaking up of patriarchal structures only if adequately supported by other more radical changes in the economic, political and social system. But these changes have not even begun. Thus while there is much

to celebrate at Beijing, the struggle for women's equality appears to be poised at a critical juncture. While the first approaches to the struggle did not deny the bias against women in the economic roots of society, they focused on the changes required in the ways of seeing and ways of thinking. This radical reconstruction of the worldview appears today to have been adopted, but in fact it is only the rhetoric which is in place. For gender equality is a facet of economic growth which premises equality not only in terms of the gains of development but in allowing for participation in defining the processes and goals of development. This has not happened and, worse, there is evidence that given the prescriptions being proposed, there will be even less change in that direction. While the idea that economic growth is not a sufficient condition for ensuring women's equality is widely accepted, the fact that expansion of economic opportunities for all is a precondition for ensuring women's empowerment has been ignored. The *HDR 1995*, for instance, while it advocates various changes to increase women's entitlements, ensure a critical threshold for decision-making positions to be held by women and increase educational opportunities for women, has only this to say in terms of revamping the economic and institutional arrangements, encourage men to participate in family care, offer flexible work schedules, change tax and social security incentives, and change laws on property, inheritance and divorce. To seek special concessions in an environment where opportunities for employment, for increasing purchasing power, for accessing basic necessities are being squeezed is ridiculous and pointless. In fact certain kinds of growth being advocated are designed to make the situation worse for women. The *WDR 1995*'s emphatic recommendation that countries pursue market-based growth paths, take advantage of new opportunities at the international level by opening up trade and encouraging export-oriented growth, even while acknowledging that these movements will cause further social distress, even if only in the interim, will in the long run squeeze opportunities for equal participation in economic growth. More significantly, such a prescription makes it imperative that vulnerable sections be offered protection. Defining women as the most vulnerable of those who need to be protected from the 'interim' distress is politically safe and takes care of the demands of the women's movement. Thus in a sense there is change waiting in the wings, change which will move women towards the goal of equality, but it will be ephemeral, for it will only facilitate the consolidation of an inegalitarian economic and political system and will in time erode the current gains for women.

SAVING RATE

Negative Impact of Financial Liberalisation

IT used to be feared, as long as a decade back, that the low domestic saving rate of the US, its low household saving rate in particular, would become a source of destabilisation of the world economy. US gross saving as per cent of GDP had declined from an average of 20.3 per cent during 1973-80 to 17.6 per cent during 1981-87. The US economy was being propelled by high household consumption expenditure. In the 1980s US domestic investment began to exceed domestic saving, giving rise to a large deficit on the current account of the balance of payments as well as a budget deficit, which made the US absorb sizeable saving from the rest of the world. This situation, it was thought, could not be sustained for long. No doubt, some correction has been made in the budget deficit, but the current account imbalance, which had narrowed somewhat in the latter half of the 1980s, has got worse. The saving rate slipped further to 14.2 per cent in 1992, with only a marginal improvement to 14.6 per cent and 15.5 per cent, respectively, in the next two years. During these years when the US experienced the most rapid economic recovery amongst all the industrialised countries, according to the latest BIS annual report and the OECD economic survey of the US, net household saving as percentage of personal disposable income dwindled from 8.3 per cent in 1984 to 5.5 per cent in 1992 and further to 4.1 per cent each in 1993 and 1994. At the other end of the spectrum, net household saving in Japan rose from 14.4 per cent to 15.6 per cent and 16.6 per cent, respectively, over the same period.

It could be argued that the US economy has not collapsed, that in fact it has prospered, despite the low saving ratio. It could be further suggested that with the freeing of cross-border capital flows and financial sector liberalisation the world over, inter-country imbalances in saving can now be evened out smoothly without disrupting the world economy. But, on the other hand, it is equally true that because the present world economic order makes it possible for some rich countries to promote high consumption levels which propel their growth, a general shortage of saving is being created. Second, what is also being promoted is an unequal distribution of world saving as the richer countries are able to attract productive capital in far larger measure than the poorer countries. Finally, for the above reasons, the cost of capital for the poorer countries has tended to increase with rise in world interest rates.

These developments have raised quite an interesting debate on the whole question of trends in world saving, saving behaviour of individual countries and its determinants and consequences. In its latest *World Economic Outlook* (May 1995) the IMF has provided a succinct review of the issues involved. Historically, it is the US which was the highest saving nation in the world (with a saving rate of 20 per cent of GDP as early as the 1870s), whereas most of the other industrial countries, including Japan, the UK and France (as also Canada and Australia), had much lower saving rates (between 10 and 15 per cent). While the US saving rate stayed remarkably constant over most of the 20th century until the 1980s, virtually all the other industrial countries and the fast growing among the developing countries have seen their saving rates move up to the 20 per cent range. A few countries, such as Japan, China and some of the newly industrialising Asian economies, have achieved saving rates in excess of 30 per cent.

Driven partly by the rapid rise in Japan's saving rate, overall world saving rate climbed steadily from the 1960s, touching peak levels during the oil price shocks of 1973 and 1980. But since 1980 the world saving rate has declined markedly. Having averaged 23 per cent in the pre-oil shock years of 1960-72, it rose to 25 per cent between 1973 and 1980 and then came down to 22.5 per cent after 1981, it averaged 21.75 per cent in 1992 and 1993, down by over 2 percentage points from the levels of the late 1960s and the 1970s. It is interesting that the restraint on consumption necessitated by the oil price increases, in the industrial countries in particular, brought about a rise in world saving.

The IMF review highlights that decline of public sector saving has been responsible for the fall in saving rates in the industrial countries. It is the public sector in other words which has sustained the high private consumption levels. The industrial countries currently account for roughly one-half of world saving, though their share of world GDP is over 70 per cent. By contrast, the average national saving rate of the developing countries has shown a sharp upward trend from about 19 per cent of GDP in 1970 to 27 per cent today. The rate for the developing Asian countries has gone up by over 10 percentage points, from 21 per cent in 1969 to over 31 per cent in 1993, thanks to the rise in private saving rates. Saving rates in Africa and the developing countries in the western hemisphere have, however, come down – in the case of the latter countries after rising in the 1970s. The IMF study comes to the categoric, and significant conclusion that "among the factors responsible for the fall in the saving rate in these countries were the surge in capital flows and financial liberalisation, which resulted in increased access to domestic and foreign borrowing". The impact of financial liberalisation on saving

behaviour has been negative also in the industrial countries, according to the IMF. In the developing countries, while the inflow of foreign capital may increase the total funds available for investment, it is likely to partially replace national saving by raising domestic consumption. Suggesting a distinct negative relationship between domestic saving, especially private saving, and the inflow of foreign saving, the IMF review brings out how capital flows into the major Latin American countries have lowered national saving rates because these countries simultaneously liberalised and opened up their financial systems. The high growth Asian countries, on the other hand, followed very cautious policies in opening up and liberalising their financial sectors and the result has been that in their case capital inflows have supplemented national saving and increased overall investment. The IMF review also finds that the impact of foreign aid on saving, though mixed, has been generally negative, with some 40 per cent of aid on average going into consumption.

The tricky question of the relationship between income growth and saving rate remains unanswered. The impact of changes in the real interest rate on the saving rate is similarly ambiguous, with both a positive substitution effect and a possible negative income effect. Empirical studies have generally found little overall effect. Also ambiguous is the effect of taxation on saving behaviour, because taxes and subsidies for saving exert their effect through the effective post-tax interest rate and, as noted above, the saving rate has been found to show not much sensitivity to changes in the real interest rate. The effect of the real interest rate on saving tends to be all the more weak in developing countries because of liquidity constraints and low levels of income. The effect of the age composition of the population on the saving rate has been found to be significant, particularly in the OECD countries. The life-cycle model, with providing for retirement taken as the principal motivation for saving, would expect the saving rate to decline as the proportion of the retired in the population increases. On the other hand, a higher proportion of those below the working age and of dependents would also tend to depress the saving rate.

POLITICS

Deal-Makers' Opera

WITH the Lok Sabha polls (due early next year) looming large before the political parties, their leaders have already started working out and testing equations among themselves for negotiating possible alliances and adjustments in order to face the unpredictable electorate in 1996.

Developments in the various political camps during the last few weeks indicate both open overtures and covert powwows among different parties and individual politicians, formulating their respective electoral strategies. While the major political parties and combinations are in a rush to capture power at the centre, the smaller and regional parties, as well as independent politicians, are clamouring to gain a foothold in what might turn out to be a hung parliament where they hope to serve their own interests by playing a decisive role in the horse-trading that would determine the formation of the next government in New Delhi.

Among the major contenders, the sudden decision of the BJP-Shiv Sena government of Maharashtra to felicitate the union home minister S B Chavan on his 75th birthday – otherwise an eminently forgettable occasion in the public mind – and the latter's readiness to attend the ceremony (in spite of opposition from a section of his own party in Maharashtra) are not without electoral significance. The glib explanation offered officially by both the BJP-SS alliance and the Congress Party that it was merely an expression of the state government's ardent desire to honour a 'hero' of Maharashtra whose popularity was supposed to cut across all political barriers will not convince anyone. One view is that Chavan decided to attend the ceremony after getting the nod from the prime minister. With the rapid erosion of the ranks of his followers in the party, Narasimha Rao is obviously keeping his options open, using Chavan as an olive branch to the Sangh parivar. We should not be surprised if tacit understanding is arrived at between the BJP and Rao on the eve of elections.

The other political parties also are hedging their bets by negotiating with regional groups, breakaway factions of the Congress, influential independent candidates and all sorts of odd parties and politicians, not knowing which among them might turn out to be handy in their pursuit of power in New Delhi. The National Front, with the Janata Dal as its leading constituent, is inclined to give up a central strategy laying down uniform principles for poll alliances in favour of a flexible approach that would allow its constituents to come to an understanding with parties or individuals according to their respective needs. We are thus entertained by the political burlesque in the south, where super-star NTR invites Jayalalitha, Rajnikanth, Raikumar and a host of similar matinee idols to form a front called 'Bharat Desam'. At the same time, he hastens to assure the National Front and other national parties that he is amenable to negotiations for electoral adjustments. It is obvious that NTR is trying to expand beyond his Telugu Desam (already fragmented by family squabbles) and emerge as a presiding deity over the southern states – Andhra Pradesh, Tamil Nadu and Karnataka, though not Kerala which, mercifully, has not yet succumbed to the tinsel politics of the film world.

In the northern states, the non-BJP and the non-Congress political parties are also unwilling to put all their eggs in one basket. Both Mulayam Singh Yadav of UP and Laloo Yadav of Bihar – at loggerheads with each other – have taken care to keep Narasimha Rao in good humour. Both are on the hit-list of the Sangh parivar and therefore need protection from the centre. Considered as 'untouchables' by the BJP, they have no option but to join the National Front, but at the same time cannot afford to antagonise Rao, should the latter return to power.

From all these behind-the-scenes deals and all the ambivalent gestures and utterances of politicians what has totally disappeared is ideology – or whatever little of it is left today in the Indian political arena.

KASHMIR

Charade All Round

A correspondent writes:

THE killing of the Norwegian hostage by the Al-Faran militants throws a murky light on the nooks and crannies of the Kashmir dispute, in which are stuck not only New Delhi and Islamabad but Washington too. Trapped by its traditional policy of playing footsie with Pakistan, the US is now being hoisted by its own petard. The Clinton administration should have to do a lot of explaining to its citizens as to why the all-powerful diplomatic and military clout of Washington could not extricate a US national (one of the hostages held for more than a month) from the clutches of a terrorist group which is patronised by the same Islamabad which is being armed by Washington.

On the stalemate over the hostages in Kashmir, curiously enough, all three governments appear to share a common strategy, which is long on diplomatic rhetoric and short on operative measures to get the hostages released. To take our government first, no one in his senses of course could have expected the Indian army to locate and attack the den of the Al-Faran group and rescue the hostages. Its performance during the Charar-e-Sharief operation, when it failed to apprehend Mast Gul who literally walked away from the shrine in front of the army jawans and officers, is evidence of the army's capabilities. The only option left with New Delhi therefore was to blow hot and cold – now threatening to punish the abductors and then appealing to them and finally depending on diplomatic initiatives. Following this, we were entertained by a number of intriguing developments. Under US pressure,

we were told, Maulana Fazlur Rehman, chairman of the Pakistan Senate's foreign relations committee, who is reportedly closely allied with the Al-Faran group, was allowed to visit New Delhi, presumably to establish contacts with the group and persuade it to release the hostages. The Maulana cooled his heels in the Indian capital for a while and then went back to Pakistan.

This brings us to the role of Islamabad. If Maulana Fazlur Rehman was the crucial link between the Pakistan government and the Al-Faran, as we were told, one wonders why it was necessary for him to come all the way to New Delhi to speak to the abductors. He could have done the job from what he calls 'Azad Kashmir' lying within the territory of his own government. Does it mean that Islamabad does not have any control over some of the militant groups operating in Kashmir which it had trained and armed? Or are the ISI and Benazir Bhutto operating at cross purposes? At the end of it all, poor Bhutto was left with the embarrassing task of condemning the killing of the Norwegian hostage by militants whom only the other day she was lauding as 'freedom fighters' receiving 'moral support' (a diplomatic euphemism for military aid and training) from her government.

Whatever the way in which the hostages crisis is resolved, it is clear that both Pakistan and India have bungled in their respective strategic plans on Kashmir. New Delhi underestimated the ruthlessness of a gang of desperadoes, which, it thought, would hesitate to kill foreign nationals. But Al-Faran, peeved by its inability to get its leaders released from Indian jails, and bereft of any sense of responsibility to the cause of the Kashmiris, had no qualms about killing a hostage. It has no doubt embarrassed Islamabad, which should realise now that it has created a Frankenstein by training and arming numerous groups of militants of which it may have lost count by now. The logic of such a muddled militarist strategy inevitably leads to the proliferation of armed bands of mercenaries which acquire an autonomy of their own and create situations beyond the control of their patrons. New Delhi had to pay a heavy price for adopting a similar policy when it trained and armed the Sri Lankan Tamil militant groups, among which the LTTE emerged as a challenge to New Delhi itself and humbled the Indian army in Jaffna. Short-sighted as it is, the ISI of Pakistan failed to learn lessons from its Indian counterpart, the RAW.

One hopes however that among the Kashmiris, those who claim to be freedom fighters, the politicians who support them and the people who sympathise with them will take lessons from the Al-Faran abduction experience. Their dependence on Pakistan's moral and military support (without seeking alternative sources of aid, both inside India and abroad) has not only diluted their identity as freedom fighters (as distinct from the pro-Pakistani Kashmiri groups seeking Kashmir's merger with Pakistan), but also crippled their will and ability to prevent the Pak-sponsored groups – both Kashmiri and those consisting of foreigners (Afghans, Saudis, Libyans and others known in the valley as 'guest militants') – from dominating the armed movement and indulging in crimes like rape, extortion, abduction, etc. It is this that led to the emergence of the hitherto obscure group called Al-Faran from among the Pak-armed militant squads operating in the valley, which had acquired enough clout not only to be able to defy the Indian army, but also to refuse to heed appeals from the local Kashmiri militant front, the Hurriyat Conference. It is quite apparent that Al-Faran owes no loyalty to the local Hurriyat or even to its Pakistani mentors. The Hurriyat then should realise that the Pakistani strategy of indiscriminately arming mercenaries has not worked to the advantage of the Kashmiri militants and would inevitably lead to crimes like the killing of an innocent hostage. In an attempt to dissociate itself from the ghastly incident, the Hurriyat promptly called for a 'Kashmir bandh' protesting against the killing of the Norwegian hostage. But, not daring to condemn Pakistan for arming Al-Faran, the Hurriyat leaders came up with the theory that Al-Faran was an 'Indian intelligence agency'.

How long can this charade continue – with India pretending to solve the Kashmir crisis by holding elections, Pakistan posing as a saviour of Kashmir while planning to annex it and the politicians of the Kashmiri militant movement blaming New Delhi for their own failure to stem the degeneration of the movement that had been brought about by Pakistani military aid and abetment?

NUCLEAR TESTS

Obsolete?

THE Clinton administration's announcement that the US would not conduct any further "nuclear test explosion or any other nuclear explosion" has moved the comprehensive test ban treaty (CTBT), currently being discussed by 38 countries in Geneva, several steps closer to becoming a reality. On the other hand, it does not ensure that the US will either reduce its nuclear arms stockpile or even refrain from adding to it. Nor for that matter is the declaration as momentous as it is made out to be.

The point of fact is that ever since the idea of a comprehensive test ban treaty was conceived there has been an enormous investment in pursuing research on evolving alternative methods of testing which validate and test the reliability of nuclear systems but do not involve explosions. Hydronuclear testing, the capability for which France is now reportedly attempting to acquire in the course of its eight nuclear tests in the Pacific, release very low nuclear energy while being capable of validating the design of a nuclear weapon. A recent well-circulated statement of an influential group of American physicists has suggested that the US could maintain reliable nuclear weapons without physical nuclear tests. There is sufficient information to show that experiments on evolving testing procedures using laser simulations and complex computer systems have been successful enough for the US to have made this declaration of a ban on nuclear test explosions. What is of import here is that all these newer methods of testing without explosions are with the US mainly and to a much lesser extent perhaps with France and the other big nuclear powers. In other words, even if a comprehensive test ban treaty comes into force – and now with the US pushing it, objectors such as Russia may have to fall in line – those countries with the capability of evolving new procedures for testing which do not involve explosions will carry on with the nuclear race.

The other issue, of course, is that even while big nuclear countries have spent large funds in evolving testing procedures, etc, not enough research has gone into the mechanisms of monitoring any of the test ban treaties. The International Atomic Energy Agency (IAEA) charged with the contradictory responsibilities of both promoting peaceful uses of nuclear energy and at the same time ensuring that the terms of treaties such as the NPT are observed, has floundered badly. Its inefficiencies and lack of capability to do its job have become especially evident after the Gulf War and subsequently when it was revealed that South Africa, which had opened its installations to IAEA inspection, was simultaneously creating a nuclear arms industry which the IAEA would certainly have known about but did not divulge. That large-scale illegal proliferation of arms-making material has been taking place is now an established fact and the IAEA's lack of authority as well as of technological inputs to monitor the arms race has become clear.

Thus while Clinton's announcement, coming as it did soon after the Republican-dominated Senate voted $50 million for low-level nuclear tests and in the wake of the world's continued anguish over Hiroshima and the widespread reaction against the French decision to resume testing, may have gained him friends at home and abroad, it in fact does not in any way move the US or the other big powers in the direction of a world without nuclear weapons. In fact there is every possibility it will make the CTBT obsolete and/or ineffective even before it is signed.

DUNLOP INDIA

Record Turnover

DUNLOP INDIA, a member of the Chhabria group of industries, closed its financial year ended December 1994 with a record sales turnover of Rs 596.98 crore, growing by over 36 per cent over the figure for the previous 18-month period on an annualised basis. Profit before tax was Rs 12.56 crore, registering an increase of around 90 per cent over the annualised figure of Rs 8.80 crore for the previous year. It would have been higher but for an adjustment of Rs 7.02 crore made in 1994 accounts for payment of arrears of wages and bonus to employees at the Sahaganj factory. Net profit, at Rs 12.56 crore, showed a growth of 146 per cent over the annualised figure of Rs 5.11 crore for the previous accounting period. The company has changed its accounting year thrice to eventually revert to the December 31 year-end. DIL once again emerged as a dominant player in the truck tyre sector with the average monthly sale reaching 40,000 tyres. The steep increase in profit after tax has been attributed to revision of marketing strategies, greater attention to customer service and an improved product-mix. A dividend of 20 per cent has been declared by the directors.

Dunlop India for the first time exported aero tyres to the US. A major breakthrough was achieved with the company getting repeat orders for steel cord belting from Australia. Trial exports to open up new markets in Vietnam, Latin America, West Asia, Philippines and Myanmar bore fruit as confirmed orders had been received.

In the various market segments – truck tyres, passenger car tyres, farm tyres and aero tyres – the company recorded sales increases of 37 per cent, 21 per cent, 36 per cent and 60 per cent, respectively. In the industrial products category, sale of steel cord belting increased by more than 20 per cent. In respect of aero tyres Dunlop India qualified in the tests of the Federal Aviation Authority of the US and the certified testing facilities of Dunlop, UK. The new H-40 tyre has been developed for Boeing aircraft. Production of sophisticated steel cord belting was increased by 100 per cent after the completion of a Rs 30 crore investment programme phased over a span of three years. Besides two new brands – Glider (a textile belted car radial tyre) and Mahaan (a heavier rear-wheel tractor tyre) – were also launched.

Dunlop's forthcoming projects are a part of its 'Vision-2000' prepared with the objective of well-structured backward and forward integration with the thrust on expanding the core business areas of tyres and rubber products and reducing dependence on outside agencies. Dunlop will reduce its overwhelming dependence on natural rubber by switching to synthetic rubber. It has set a target to change the raw material mix to 35 per cent of synthetic rubber in 1995. The company's modernisation and expansion projects have been put under the charge of its technical collaborator, Sumitomo Rubber Industries of Japan which is the worldwide owner of the Dunlop brand name except in India and France. A new state-of-the-art poly V-belt manufacturing facility in collaboration with Mitsubishi Belting of Japan has been proposed for the industrial products division.

DIL has signed a memorandum of understanding with Gujarat Industrial Investment Corporation for a Rs 700 crore joint venture at Savli to be completed in 25 months. Another joint venture is on the anvil in Gujarat for manufacture of hoses, metalstiks and adhesives. Also to be implemented shortly is a passenger steel radial tyre manufacturing project at the Ambattur factory near Madras. After modernisation, the truck tyre manufacturing capacity would go up from 3 to 5.7 lakh tonnes per annum (tpa), that for car tyres from 3 to 7.3 lakh tpa, aero tyres from 0.24 to 0.48 lakh tpa and industrial belting from 3,000 to 6,000 tpa. The upgradation scheme will include induction of latest 4-bowl calender, modern mixing plant, back pressure turbine and new belting process.

Dunlop is to enter the capital market in August/September with a rights issue of about Rs 318 crore. The proposed issue would be in the form of partly convertible debentures (PCDs) of Rs 200 each with two sets of tradable warrants. One PCD, in two parts, would be offered against two ordinary shares held. Of the total funds to be mopped up, a total of Rs 190 crore would come from PCDs and about Rs 128 crore from warrants. This is the first time that Dunlop is raising funds from the capital market since the company was taken over by M R Chhabria in 1985.

The company's factory at Shahganj, which is the only tyre factory in the country to produce aero tyres and a range of industrial products, has technological collaborations with five world famous rubber companies, namely, Sumitomo Rubber Industries of Japan, the aircraft tyre division of Dunlop, UK, BTR, Dunlop Enerka, Holland, and Mitsubishi, Japan, to keep itself technologically abreast of world standards. DIL is partly sourcing its products from the public sector giant, Tyre Corporation of India, to meet the demand for tyres. While the domestic demand is being taken care of by Dunlop India's Sahaganj and Ambattur factories, Tyre Corporation's production base is mainly utilised for exports. Also on the cards is a carbon black project in Haldia in West Bengal. The project, with an installed capacity of 50,000 tonnes per annum, will cost Rs 107 crore. The West Bengal Industrial Development Corporation will have a 31 per cent stake in the venture.

Dunlop India is reviving two of its ailing businesses, sports goods and bicycle tyres. The sports goods unit will be headquartered in Delhi. Among the company's other proposals are tyre manufacturing facilities in Bangladesh and the United Arab Emirates as well as a couple of industrial products units in Sri Lanka and Mauritius.

DIL has eight subsidiaries, but none of them serve any worthwhile purpose and are a drag on the finances of the company. DIL has diverted as much as Rs 35 crore to five of these subsidiaries as loans to be converted into equity shares. One of the subsidiaries with a net worth of Rs 11,000 received an unsecured loan of Rs 18 crore. Four of the subsidiaries are making heavy losses and there is a proposal to take them out of the Dunlop fold and merge them with Shaw Wallace Properties. There is no explanation for the large investments in these loss-making subsidiaries at a time when funds for modernisation and expansion of DIL have been hard to come by. A case in point is Shahgunj Industrial Finance which has been given an unsecured loan of Rs 18 crore at nil rate of interest and with a 100 per cent conversion obligation against the company's net worth of Rs 11,000 during the accounting year ended October 31, 1994.

Dunlop India faced some setbacks in the year under review. There was an MRTPC probe into arbitrary price increases (by virtue of its monopoly in aero tyres), throwing off of delivery schedules and inadequate compensation for defects in products. There was also a rumoured takeover threat from Essar. Further, having failed to get its $ 250 million GDR issue cleared by the finance ministry, the company now plans to turn to maximum utilisation of its revalued assets all over the country as a means of tiding over the short-term requirements of about Rs 100 crore for its growth programme, but this may prove a serious constraint on the company's plans in the long run.

HOECHST INDIA

Business Restructuring

Hoechst India, a subsidiary of Hoechst AG, the German pharmaceuticals and chemicals giant, closed the financial year ended March 1995 with a turnover of Rs 264 crore, down

(Rs lakh)

by 20 per cent from last year's figure of Rs 329 crore, the result of the transfer of the company's agro division to Hoechst Schering AgrEvo in 1994-95. The company's accounts for the year under review deal only with the pharmaceuticals and animal health divisions. Gross profit stood at Rs 36 crore, up by 13 per cent from Rs 32 crore last year. The effect of the rise in provision for depreciation and taxation by 16 and 15 per cent, respectively, was nullified to a large extent by interest costs which were down by 62 per cent to Rs 6 crore. The company has declared a dividend of 30 per cent against 25 per cent paid for the previous year.

Hoechst India's performance on the export front has been satisfactory with an export growth of more than 25 per cent. Its export portfolio comprises pharmaceuticals, animal health products and bulk drugs. The Russian Federation was a major source of export business. A fillip to exports was provided by the stabilisation of the CIS markets. Hoechst India's presence in the CIS countries is borne out by its estimated market share of 15 per cent.

The pharmaceuticals division, the flagship of Hoechst India, manufactures antipyretics, antihistamines, antispasmodics, antibiotics, antidiabetics and vaccines for rabies and typhoid. The company's animal health division with a market share of 11 per cent ranks third in the industry. The division goes beyond production and its field representatives are trained to offer technical advice to veterinarians and farmers to promote animal health and hygiene.

Hoechst AG had three companies in India till now: pharmaceutical manufacturers Hoechst India and Roussel India and chemical manufacturer Colour-Chem. In March this year Hoechst India was divested of its agrochemical division and AgrEvo India was formed as a subsidiary of Hoechst Schering AgrEvo GmbH, an international joint venture between Hoechst AG and Schering AG, the rationale being to draw on the strengths of the two international companies. The company, which has a market share of 6.3 per cent in the crop protection market, plans to gradually increase it to 10 per cent. The product portfolio will include insecticides, fungicides and herbicides for cotton, rice, tea, pulses, wheat and other cash crops. The company plans to introduce 10 new products in a period of five years using bio-technology and gene technology. In December 1994, a new product, Illoxan, a wheat herbicide, was introduced from AgrEvo's international range in India. Besides crop protection, a priority area for the company is environmental health. In this segment, it is focusing on home hygiene products. In the coming months the Rs 35 crore animal health care division is to be hived off as a subsidiary of Hoechst Veterinar GmbH.

Hoechst acquired Marion Merrel Dow Inc (MMD) in July this year at a cost of $ 7.1 billion. With this acquisition, Hoechst Marion Roussel, as the new merged entity is to be called, will enhance its worldwide presence, particularly in North America. The two pharmaceutical multinationals in India – Hoechst and Roussel – will come under a common management and bring new products from Marion Merrel Dow into the country. Roussel is now a subsidiary of Hoechst India but operates separately. A plan to closely integrate the working of the two companies is being drawn up. While Hoechst India has 66 per cent stake in Roussel India, the other 33 per cent is with Roussel Uclaf of France. Hoechst AG has 50.1 per cent in Hoechst India, with another 28 per cent being owned by Vijay Mallya. The MMD products that may be co-marketed by Hoechst and Roussel are rifampicin, diltiazem, terfenedine and vegabatrin, thereby posing a likely challenge to Lupin which is the market leader in rifampicin. With combined sales estimated at $ 10 billion, Hoechst Marion Roussel (HMR) will be one of the world's largest pharmaceutical organisations and will concentrate on cardio-vascular and anti-infective and metabolic drugs. Hoechst India spent 2.5 per cent of its annual turnover on R and D in 1994-95. According to Werner Badziong, research director of Hoechst India, the company is currently engaged in research in anti-infectives, cardiovascular drugs, alternative treatment for diabetes and treatment for arthritis. The acquisition of MMD which spends a major portion of its sales turnover on research will be beneficial to Hoechst and Roussel products in India, it is claimed. In 1994, MMD spent around 15 per cent of its sales turnover of $ 3.1 billion on research.

A proposal to form a joint venture to manufacture polyethylene between Hoechst AG and Indian Petrochemicals Corporation has been abandoned. According to Eberhart Baltin, CEO, Hoechst India, "it would have got us involved in the ethylene business where we have no interest". A 50:50 joint venture with Reliance at Hazira to make polyester-based industrial yarn is on the cards. Hoechst will provide the technology and Reliance will supply the raw materials. The possibility of building an industrial paints company in India for the automobile industry is also being looked into.

With a view to further consolidating its position in India, Hoechst India is on the look-out for companies that are weak and unable to withstand competition or are faced with internal problems. Hoechst has been looking for a possible partner for its Penicillin G project but has not been successful so far. It is also considering more co-marketing arrangements with pharmaceutical companies. It already has such tie-ups with Boots and Ranbaxy.

ZUARI AGRO CHEMICALS

Rise in Fertiliser Demand

Zuari Agro Chemicals, a K K Birla group company, has reason to be happy with its performance in 1994-95. Turnover for the year stood at Rs 679.61 crore, up by around 31 per cent from Rs 519.46 crore recorded in the previous year. Gross profit was up by 130 per cent from Rs 44.97 crore to Rs 103.24 crore. After provision of Rs 4.66 crore for depreciation and Rs 41 crore for taxation, the company's net profit was Rs 57.58 crore, a rise of 165 per cent from Rs 21.71 crore in the previous year. A 20 per cent hike in the retention price of urea coupled with the impact of the full year's working of the cement division and better performance of the fertiliser division were responsible for the improved results. Enthused by this performance a dividend of 60 per cent has been announced by the directors.

During the year under review, the company achieved a sale of 8,68,481 tonnes of fertilisers. Production of urea and phosphatic fertilisers was 4,02,296 and 3,26,065 tonnes, respectively. Notwithstanding the increased prices of phosphatic and potassic fertilisers and delayed announcement of government concession schemes, the company's sales of phosphatic and potassic fertilisers increased by 21 per cent. The company commenced marketing of single superphosphate under the brand name 'Jai Kisaan Superphos', adding to its existing range of products, and achieved a sales volume of 26,849 tonnes in the first year of its introduction. Sale of pesticides increased by 12 per cent. The company launched 'Bioneem', an eco-friendly neem-based insecticide, in January this year. Zuari Agro is the first Indian company to have started marketing bio-fertilisers from 1992 and the sale of 'Biophos', an environmentally friendly product, rose by 78 per cent last year and was Rs 883 crore. The company markets its fertilisers in Goa, Maharashtra, Karnataka, Andhra Pradesh and western Madhya Pradesh and Uttar Pradesh.

The company has major diversification plans on the anvil. It plans to set up a 2,500 tpd capacity sugar factory at Bidar in Karnataka. With plans to make a foray into financial services, the company has set up Zuari Leasing and Finance Corporation with a paid-up capital of Rs 3 crore. The company has formed a joint venture company in the name of Zuari Seeds in January this year with the Institute for Vegetables and Crops (IFVC) and KOP Investments, Cyprus, on a 50:50 basis for the production and marketing of hybrid seeds. Technical support along with assistance for R and D activities in India would be provided by IFVC. The joint venture will help the company in enhancing the quality and varieties of seeds and will also be in line with the government's policy to allow the private sector to play a leading role in hybrid seeds development in the country. The company has set up a research and development farm and seed testing facility at Hyderabad.

Zuari Agro along with National Fertilisers is setting up a fertiliser plant in Syria, in collaboration with the Syrian government. The possibility of obtaining gas at an economic price in Syria, the key to manufacturing urea at a low cost, is being looked into. Though the location of the plant remains to be decided, the capacity is likely to be 1,350 tpd ammonia and 2,200 tpd urea.

Zuari Agro had originally planned to set up a 1 million tonne grass roots cement plant in Rajasthan, but as cement plants of this size are no longer viable the company has taken over Texmaco's cement plant located at Yeraguntla in Andhra Pradesh with a capacity of 5 lakh tonnes of standard Portland 53 grade cement and plans to expand it. The expansion will be carried out in two phases. The first phase will include doubling the capacity to 1 million tonnes and then to 1.5 million tonnes. A fillip to the cement industry is expected to be provided by the likely privatisation of roads and according to the company's executive president, Gopal Srinivasan, the company hopes for Rs 100 crore growth from cement. The company has entered into an agreement with BOC (India) for the marketing of argon produced by the company's argon recovery plant in Goa.

The company has been awarded the Jamnalal Bajaj Uchit Vyavahar Puraskar by the Council for Fair Business Practices.

CURRENT STATISTICS

EPW Research Foundation

After touching the lowest level in the last two years in the previous week, the provisional annual inflation rate went up sharply from 7.56 per cent to 8.15 per cent in the week ended August 5. The consumer price index for agricultural labourers for June showed an annual rise of 12.4 per cent almost 2 percentage points higher than the rise in the index for industrial workers. The rise in RBI credit to the central government, while below the levels touched in the previous weeks, is still very high at Rs 16,999 crore (compared to a contraction of Rs 252 crore in the same period of 1994-95). Deposits and advances of commercial banks continue to decline.

Science, Technology, Intellectual Property Rights and Development

Arun Ghosh

We need to rethink the entire basis of budgeting, of our education policy, our policy on science, our stance on intellectual property rights and the distinction between public and private property in knowledge.

IN a superb analysis of recent developments in the sciences - pure science applied science, and technological progress - John Ziman (a scientist himself) looks back wistfully at three centuries of scientific progress, and with some uncertainty and trepidation at what the future holds (*Prometheus Bound*, Cambridge University Press, 1994) Ziman is not focusing on the moral-ethical issues that are increasingly involved in some applications of scientific knowledge. Himself a scientist Ziman accepts the unrelenting thirst of mankind for new knowledge, for exploration of the universe in all its facets, as a fact of life Ziman's concern is that this spirit, this quest, is now under increasing threat because of the growing dependence of science on the funding of research, and the increasing focus on *organised research for commercial purposes* Individual quest is now getting to be more and more 'sidelined' because of the problem of 'funding', and to a scientist, this is akin to the chaining of Prometheus The central theme of Ziman's (highly stimulating) study is "the profund transformation that is taking place in the *institutional* arrangements for undertaking research and invention"

Ziman is a realist He accepts the close interconnection between science and technology He also realises that any scientific advance has multidimensional impact; the 'spin-off' of information technology into defence and armaments related technology, of biotechnology for developing catalysts for chemical plants, of an immense number of similar developments which emphasise the multi-disciplinary nature of science

The scientific and technical advances made in the world in the short span of the past 50 years – indeed, possibly in the last 25 years - have in fact changed the entire perspective for the future of mankind Equally, the direction of recent scientific (and technological) developments today should evoke deep concern not only of scientists like Ziman, but of sociologists, economists, politicians, of the people who have to periodically vote politicians to power

One cannot, of course, either *explain* how research gets directed, or *forecast* the results of research. As Ziman says, "it might be very difficult to determine from a highly mathematical analysis of turbulence whether it had originally been motivated by intellectual curiosity, or whether it had been undertaken in order to solve an urgent practical problem arising in the design of an aircraft .The professor of applied mathematics chooses to work on the theory of turbulence in the hope of eventually being able to publish some interesting results that will add to his scientific reputation the aeronautical engineer is instructed by the management of his firm to work on the same theory 'in the hope that it will lead them to a more efficient design"

Ziman recognises that this "convergence of basic and applied research at the level of the laboratory bench has profound effect on the way science is organised" In fact he recognises that pure science and applied technology are getting more and more intertwined and it is increasingly becoming difficult to segregate them, or to treat them as separate subjects separate quests The best illustration – given by Ziman - arises in the area of solid state physics In the 1930s, quantum theory made sense of the varying properties of conductivity of different metals From 'semiconductors' we have now gone on to a wholly restructured 'microchip' which is today at the heart of information and control technology.

It is this type of scientific development that makes traditional economic theory 'outdated'. We are today in a world where the 'increasing returns' from 'knowledge' make the theory of the firm – based on the Ricardian principle of 'diminishing returns' - totally irrelevant. Indeed, it is this factor which is leading, all over the world today, to an increasingly monopolistic production structure. The Walrasian 'general equilibrium', in the modern world, is as dead as the dodo.

No generalisations are, of course, possible, such is the fluid, the dynamic character of modern science and technology. For example, the development of the 'microchip' has changed the economies of scale in many areas, and relatively *small* production units - based on knowledge and skill intensity and a Flexible Manufacturing System (FMS) – are now possible. And yet, equally, both the vast sums required for research and development, and the overlapping of scientific applications, have led to a gradual elimination of 'competition' as we understand it, from many spheres of production To quote from Ziman again, "...many of the components of the modern microchip are not really junction transistors at all, but depend... on some other phenomenon, such as a 'field effect', or 'charge coupling', or 'impact ionisation'... In combination with parallel developments in optics, solid state physics... is already revolutionising the telecommunications industry." The use of optic fibre has changed both the scale and the dimensions of 'economic' production/service industries. Obviously, we need a new institutional framework, a whole set of new economic principles going back, for much of economic activity - to 'utility pricing' theory, and an institutional mechanism for enforcing the same For most of production activity, 'competition – in the Adam Smithian sense is also as dead as the dodo

The current phase of high-technology industry can be sustained only "if enough resources were thrown into its development" This is the lament of the scientist in Ziman, resources are now increasingly available only for organised research for commercial exploitation.

There are some frightening implications of the way science and research are getting organised of late As Ziman – who maintains a wholly amoral stance in this context - says, 'As the Strategic Defence Initiative of the United States government clearly demonstrates, apparently responsible people can now be persuaded that targeted R and D can blast its way to any technological goal, however implausible this may seem to the great majority of the relevant experts".

Realism requires that one must recognise (a) the close links between scientific and technological advance, and (b) the equally close links between the 'funding' of research - whether by the state or by private commercial entities – and the results of research activity. While this is generally wholly understandable for the funding of research by commercial entities, who would always look to commercial profits arising from any investment – be it on hardware or on research – the logic is not equally clear insofar as the state is concerned, the primary concern of which should be the welfare of the people. This is not a moral-ethical issue, it concerns the fundamentals of the organisation of society. The state can justifiably exist only inasmuch as it can further the welfare of the people living within the boundaries of the state; it is essentially a political arrangement among the people of that state; and in modern society, different states have to coexist, so that resources are not thrown into competitive SDIs but for the development of the people. The moral-ethical issues arising from scientific progress stand apart; even without passing any moral-ethical judgment in regard to some recent developments in the area of, say, genetic engineering, or of research on nuclear armaments, one can still insist that the responsibility of every state is the universalisation of 'knowledge'.

the upgradation of skills, and the promotion of scientific and technological research within the state. That is the fundamental basis of the 'social contract' implicit in the constitution of any state. Certainly, the Constitution of India, the Directive Principles of State Policy enshrined in the Constitution, enjoin the Indian state to promote both the universalisation of knowledge and the upgradation of the skills of all the people of India.

But we digress. Let us return to Ziman's analysis of the 'chaining' of Prometheus. Ziman is quick to point out that "The defect of 'market pull' as a paramount principle of science policy is that it underestimates the inherent unpredictability of scientific discovery". He gives the example of the 'Strategic Defence Initiative' of the US which promoted the development of 'pure science' which in turn helped to develop 'generic' or 'enabling' technology. The market is not interested in pure science. According to Ziman, "Contemporary changes in the way that research is organised are putting this tradition (of encouraging pure science) under pressure. ." 'Strategic research' is encouraged with a definite purpose, whereas pure science is what scientists are free to pursue, at the taxpayers' expense. Increasingly, however, scientific information is being commoditised. To quote Ziman again, "The actual boundary between science as *public* knowledge and technology as *proprietary* knowledge has never been sharply defined." Increasingly, however, the convention of keeping science and scientific information – and the promotion of science as a process of enhancing public knowledge – is coming under threat.

Ziman sees this as an inevitable process; he recognises that politicians are under increasing pressure to cut public funding of the spread of scientific knowledge, scientific research and science education. He, as a scientist, regrets this development; and he points to the danger of any external agency – external to the scientific community – setting 'priorities' for scientific research. And yet he pleads for continuing encouragement to human quest for greater knowledge, he pleads for

"-Social *space* for personal initiative and creativity;
time for ideas to grow to maturity,
– *openness* to debate and criticism;
– hospitality towards *novelty*, and
– respect for specialised *expertise*."

Alas, Ziman is crying in the wilderness. Exactly 75 years back, Alfred Marshall wrote presciently, "knowledge is our most powerful engine of production; it enables us to subdue Nature and force her to satisfy our wants. Organisation aids knowledge... The distinction between public and private property in knowledge and organisation is of great and growing importance; in some respects of more importance than that between public and private property in material things..." (Marshall, *Principles*, Eighth Edition, 1920, Macmillan, pp 138-39).

Why do we hammer away at this point again and again and again? We have, under the influence of neoliberal economists, fallen for the dictum that the 'market' is the best mediator for the allocation of all resources; that 'minimum government' is the best form of governance that even education and health of the people are best left to market forces. Under the IMF/World Bank guided economic policies in force since July 1991, direct taxation is being reduced in order to give "greater space to the private sector". And, as a result, in order to curb the budgetary deficit, not only budgetary support for infrastructure is being cut, even the outlay on education, health, scientific research is being subjected to increasing cuts. We have government colleges and universities imparting scientific education, with no laboratories, or with laboratories with no equipment, or without the materials with which to conduct experiments. When our academia in the universities, in the IITs, in the scientific research institutions should be concerned with such problems as the basic science of materials – not just metals and insulators but ceramics, high-density polymers, metallic glasses, fibre-reinforced composites, amorphous semiconductors, biocompatible alloys, with electron microscopy of structural materials, with the atomic arrangements in metallic glass, with what makes the chain molecules in a crystalline polymer fold up the way they do, with the mechanical properties of composite materials, and now with the boundary between a piece of metal and living tissue (some of the current basic science problems highlighted by Ziman) – our political bureaucracy is driving the rapidly declining scientific community in India, through an increasing financial crunch to seek funding from large-scale industry by orienting and attuning their research endeavours to meet the specific needs of the industries financing research. Scientific organisations like the CSIR have been bluntly told that their research must be tailored to the demands of the market, that they must find commercial sponsors for their research. The only agencies so far spared the axe are the nuclear and space agencies for 'strategic' reasons. But from where will these institutions get young scientists, if the teaching of science is to be downgraded, if research in pure science is to be obliterated from all universities and scientific institutions? Our politicians need to realise that (a) the instrumentation and other equipment required for good, scientific research is expensive; (b) that such research, though occasionally done individually, usually requires group effort, which can only be promoted if there are *teams* of good scientists working in tandem, and (c) that the development of any nation depends crucially on the extent to which its scientists and technologists can keep one jump ahead of the rest of the world in crucial areas which can bring about paradigmic changes – through scientific discoveries and inventions – in production technology, through revolutionary changes in the use of materials, reducing costs, and making for unprecedented changes in output and exports. But these changes can occur only when our scientists are one jump ahead in their analyses of 'materials' and their properties. Where are such teams today other than in the BARC and the NASA? And are the scientists there driven by a market ideology?

Today the establishment of such research in new areas is a distant dream. Regrettably, we are sadly lacking in the universalisation of even primary education, which is now to be funded through external assistance, under the DPEP. There is an elaborate manual laying down the guidelines; even primary education in India has now to follow the dictates of the World Bank.

What has happened to our thinkers, our economists, that they do not see how this country is being rapidly colonised again, through a complete take-over of the intellectuals; indeed, of the formation of the intellect of the coming generations? While *education* languishes, satellite TV beams alluring advertisements of a consumerist society, and the cultural ethos being propagated is that of the MTV, the Zee TV, and the 'V' broadcast of Rupert Murdoch's Star TV. It may be too late to stop this rot – though mainland China has so far resisted it; and indeed, even France has banned television broadcasts from the US – but does our government realise that (a) South Korea and Japan have a domestic saving rate of 34 per cent of the GDP while ours has come down from 24 per cent in 1990-91 to 20 per cent in 1993-94, under our 'economic reform policies'; and (b) that savings do not grow under economic policies based on 'supply side economics' of the Ronald Reagan vintage?

Finally, our government's surrender to the Intellectual Property Rights regime imposed by the developed countries has so far been resisted by our parliament, the amending bill to the Indian Patents Act of 1970 is yet to be passed by parliament. But the director-general of the WTO is not worried because, as stated by him, the government of India is merrily accepting foreigners' applications for patents. Under what authority is the government of India accepting these applications in the absence of an amending Act? Is the Constitution not being violated?

The general elections are not far off. The government of India has already announced a number of populist policies, the most significant one being the idea of midday meals to all primary school children. The idea is a good one. And yet, can nibbling at the problem piecemeal solve the problem of primary education when the *total* net transfer of funds from the centre to the states in 1995-96 is less than in 1994-95?

We need to rethink the entire basis of budgeting, of our education policy, of our policy on science, our stance on intellectual property rights, of the distinction between public and private property in knowledge, of the role of the state in the development process. Gimmicks will not suffice.

COMMENTARY

Summit-Led Humanitarianism

Towards Fourth World Women's Conference

Dipankar Sinha

In the contemporary world humanitarianism in the form of the pursuit of human/social development has emerged as a major focus of international conferences. This globalisation of humanitarianism needs to be critically evaluated for several reasons. For, while such international conferences make possible the thematic documentation of the crises they also lead to an avoidance of any critical evaluation of the development processes which have led to the crises.

ONE need not be well-versed in post modern methodology to realise the fact that the presence of development also implies its absence. The history of development is replete with evidence which shows how the prosperity and well being of some are promoted at the cost of others. If we take development to be synonymous with emancipation we are compelled to notice that the majority of inhabitants of the world have been systematically marginalised to facilitate access to better life for the fortunate few. And one does not have to be a hardcore feminist to know that of the marginalised majority, women have been most vulnerable to exploitation, exclusion, instability, deprivation and violence of the worst kind. Thus there are a number of reasons to appreciate the fact that a high level UN-sponsored international conference will be held from September 4-10, to discuss women's plight and right. However our purpose here is not to discuss the possible agenda of the ensuing conference in Beijing. The main concern here is to present a precautionary note on a growing trend in contemporary development thinking and practice – over-optimism about summit-led humanitarianism.

Since the last and especially in this century, there have been several international conferences on peace, containment of war, nuclear non-proliferation, arms limitation and trade-related issues, to mention some. However what merits special attention is that in the contemporary world humanitarianism in the form of human/social development has emerged as a major focus of widely publicised international conferences, held in some cases as summits – the World Summit for Children (1990), the World Conference of Human Rights (1993), the International Conference on Population and Development (1994), the Social Development Summit (1995) as instances. Even the Rio Conference on Environment and Development (1992), more specifically its Agenda 21, has a number of provisions which, by linking environment and development to the survival of human beings address humanitarian issues directly.

The process of globalisation of humanitarianism in the contemporary world order is gradually gaining such overriding importance that any attempt to initiate a critical review of it – which might reveal some interesting correlations between the contemporary world order and its context-specific development practices – might be construed as reactionary. But a critical outlook is unavoidable if one realises that while humane development is an impending necessity in the world today, a number of indications propel one to argue that several forces specific to the contemporary world order might intervene against emancipation of those suffering from exclusion and marginalisation. Before we explain why, it might be useful to refer briefly to the conceptual background and growth of human/social development – the motive force behind the summit-led humanitarianism.

I

It will not be practicable here to repeat in detail what is widely known in development literature that the major thrust of development, as conceived since the end of the second world war and the period of reaching out to the post-colonial societies, was on economic growth. An obsession with economic growth in both the conceptual formation and practical implementation of development contributed to development becoming synonymous with growth. This in turn gave rise to a dangerous optimism that per capita income, national income, gross domestic product, gross national product, rate of industrial production, of capital formation, of consumption and of investment were the most reliable indicators of a country's success or failure in eliminating underdevelopment. Those who opposed such growth-mania did not regard these indicators as useless because they do not play a vital role in measuring the achievements of a country's economy. However, the measurement of the 'health' of the society, which constitutes the core of development as emancipation does not provide exclusive importance to these indicators. This is primarily because these indicators of growth, in segregating economy from society and in giving exclusive attention to the former, prove to be misleading because an economically advanced country may well have a backward society. The fact that a state enjoys the highest per capita income does not necessarily mean that it has a mature civil society or a high level of nutrition or gender equality or freedom, or even the right to life. It should not, however, be assumed that the mainstream development thought with its central focus on economic growth did not bring education, health or other dimensions of the quality of life under its purview. But a gradual, decisive and steady increase in the significance of the means relegated these ends to the background, and ultimately into oblivion.

The concept of human/social development did not develop overnight. Its root can be traced back to various ideas – while none of them can claim sole parentage, the following is a tentative list of major perspectives which expanded the sphere and relevance of human/social development by generating both positive and negative responses: utilitarianism (including welfarism), neo-classical economics, Keynesianism, welfare economics, development economics, and in a certain way, Marxism. While its roots can also be traced back to the basic needs approach and the alternative development – the ideas ruling the 1970s – the concept of human development began to gain wide circulation in the late 1980s. During this period 'discordant' development ideologues and practitioners, having witnessed the fiasco in the name of development in post-colonial societies, were looking for an alternative to counter the hegemony of growth-centric development. The concept in a sense was institutionalised in 1990 when the United Nations Development Programme (UNDP) published the first issue of the *Human Development Report*. It is worth noting that a number of development scholars who are not exactly fond of growthism – Mahbub ul Haq providing the overall guidance, and Amartya Sen, Paul Streeten, Keith Griffin and Meghnad Desai among others working as advisors – are associated with the preparation of the Report(s).

The *Human Development Report*(s) familiarised us with what is known as the Human Development Index (HDI). The HDI combines life expectancy at birth, access to sanitation, safe drinking water, health services, daily calorie intake, female-male gaps, rural-urban gaps, profile of homicides, suicides, child mortality rate, illiteracy rate, to mention only few, with 'traditional' indicators like real GDP per capita and GNP per capita to provide a "composite measure of human development". In asserting that the concept of human development not only

encompasses the development of people but also development for people and development by people, an attempt is made to stress the significance of developing human capabilities and their productive utilisation. Keeping in view the "means over the ends" approach of earlier development practices, the concept of human development, it is stated, "broadens the development dialogue from a discussion of mere means...to a discussion of ultimate ends". The essence of social development, it should be added, is much the same. Perhaps the most distinguishing feature of the two conceptual formations of humanitarianism-based thinking is their prefix. Apparently it might seem that prefixes like human or social are superfluous because development is ultimately a process of human/social transformation. However, the disastrous consequences of dehumanised development with its heavy toll of both natural resources and decent human existence around the globe provide enough ground to use the prefixes as constant reminder of what development is all about.

Thus there could be a number of reasons; especially for those having first hand experience of the continuing development fiasco in the third world, to support the zeal with which some of most distinguished development scholars and professionals from different parts of the world are trying to promote the cause of humanised development. This is particularly laudable in an era when the humanised message of Marxism, at least for the time being, has been reduced, partly because of some of its insentitive 'adherents' to curiculare existence. But the attempt to provide legitimacy to international meets as the most reliable implementing agency of human/social development might not be the best way of promoting humanitarianism; in fact, as we shall argue, it might be self-defeating.

II

The central plank of our argument is not to be equated with the more simplistic statement that the current spate of international conferences and summits only serves the purpose of superficial discussions on humanitarian issues. Such sweeping generalisations tend to miss the key-paradox associated with these meets: while globalising humanitarianism these meets simultaneously cater to the interests of the dehumanised world order. Interestingly the key-paradox is overlooked also by the overenthusiastic advocates of summit-led humanitarianism. Let us provide some clues to the elusive paradox.

The major source of both optimism and over-optimism about the summit-led humanitarianism is much the same: that these meets play a contributory role in placing various crucially important issues of humanised development on the global agenda and in promoting what is known as international capacity building. Any keen observer would agree that a number of issues ranging from human rights, environmental consciousness, gender relations, health care, food, shelter and education to organised crime, corruption, illicit arms trade, illicit drug trade, xenophobia, terrorism, drought desertification and poverty have been globally problematised in the fora of these meets. This not only facilitates awareness both at the level of state and at the level of civil society around the world but also strengthens the struggle against the mainstream development thought and practice. It is clear from the range of issues mentioned above that none of them, with the exception of poverty, were considered significant enough by the exponents of mainstream development. The very fact that the fate of children, for the first time, was linked to the state of development at the Child Summit, or that a linkage of environment and development was established with a humanitarian focus at the Rio Earth Summit or that poverty, lack of employment and social disintegration were combined to visualise a development pattern at the World Summit for Social Development at Copenhagen provides a sufficiently strong impression that these meets have great transformatory potential. It is perhaps (over)optimism about the transformatory promise which sometimes results in such meets taking place within a very short period with no evaluation being made of the progress during the intervening period. To elaborate, the $ 28 billion-expensive Copenhagen Summit which had alleviation and reduction in poverty generation of productive employment, and enhancement of social integration as 'core themes' had brought women under its purview. It has been asserted in the Declaration of the Social Summit that attempt shall have to be made to establish "structures, policies, objectives and measurable goals to ensure greater balance and equity in decision-making process at all levels and broaden women's political, economic, social and cultural opportunities and independence and support the empowerment of women". Several measures ranging from literacy education, equality of status and opportunity, to employment, rights and freedom and grass roots level mobilisation for leadership, have been elaborated in the Declaration and the Programme of Action of the Summit. One might 'legitimately' wonder whether the Beijing Conference will be effectively able to monitor and evaluate the progress made with regard to women's rights at the global level. The argument remains valid even if one takes into account the fact that there has been a 10-year gap between the Nairobi Conference (1985) and the Beijing Conference – the meets to discuss women's issues exclusively. The borderline between necessary overlapping and unnecessary repetition is extremely blurred, and the failure to distinguish between the two would have adverse repercussions on the struggle for human development. But what if one traces some other motive which deliberately gives rise to the 'repetitive zeal'? As hinted earlier, a fundamental feature of these meets is the 'regularity' with which they scrupulously avoid a critical view of the contemporary world order. If the statement seeems too precise, it needs further clarification. Salvaging humanitarianism in the contemporary world needs to go beyond mere problematisation of humanitarian issues by linking them to the state of the world. It needs to explore the nature and functioning of the contemporary world order and its institutional structures to reveal the hindrances – political economic and cultural – to the promotion of human face of development. A regular feature of the summit-led humanitarianism – as evident from the Declaration(s) and the Programme of Action(s) of various meets – is that an elaborate, true-to-fact and systematic presentation of the crises-ridden world is followed by highly reformist recommendations many of which are in reality responsible for perpetuation of these crises.

III

Evidently the recommended measures of summit-led humanitarianism have a narrow institutional base which is specific to the contemporary world order. One or two instances can be given to illustrate the point. All the conferences and summits mentioned here were held under the banner of the UN; the Beijing Conference is no exception. Apparently there could be nothing against involving an organisation of the stature of the UN in promoting humanitarianism at the global level. But those who resort to "if not the UN, what else?" logic with regard to the dissemination of humanitarian messages across the world tend to overlook, deliberately or otherwise that the UN might not be as neutral or as effective as the concerned citizens of the world would like it to be. While the UN celebrates its 50th anniversary this year there has been a significant erosion in its legitimacy and effectiveness. At present in Bosnia the blue helmets are losing face, as one observer puts it. The pathetic failure of the UN Peace Keeping Force in Bosnia is, however, not the only instance. The UN's partisan role and confusing activities in Somalia and Rwanda, and the shocking instance of manipulation of its might and legitimacy during the Gulf War have generated reactions in the form of frustration and anger. The most recent allegations against the UN concern its 'strict silence' regarding human rights abuses in the veto-wielding states and promulgation of 'super censorship' to delete uncharitable references to the organisaton. In short, the credibility of the UN is at stake as never before.

In our view, there can be two categories of advocates of summit-led humanitarianism, of those who expect the UN to play a key-role in the mission. The first category consists of those who sincerely but naively believe that the UN is the agency to make their dream of human development a reality. In overestimating the 'immunity' of the organisation from all kinds of pulls and mani-

pulations they tend to miss the crucial point that for the developed states the stakes in retaining the de-humanised development patterns and practices are quite high. The other category consists of those who, being fully aware of the vulnerability of the UN to the dictates of the 'supervisor-states' of the 'New World Order', recommend a leading role of the organisation to prevent the struggle for human/social development going out of control of the powers that be. Thus, both the categories – the first unintentionally and the second deliberately – minimise the possibility of posing any radical challenge to the contemporary unjust world order

That the summit-led humanitarianism rules out any possibility of structural change in the contemporary world order also becomes evident when one sees how it accords a leading role to two of the most important institutions – the IMF and the World Bank It is interesting that while the Fund-Bank-sponsored economic stabilisation and the structural adjustment programmes (SAPs) necessarily lead to drastic reductions in government spending on social services – thus aggravating the sufferings of the poor who bear the brunt of such reductions beyond redemption – the advocates of summit-based development, as evident from the recommended measures provided in the Programme of Action(s) of various UN-sponsored conferences on humanitarian issues, would think it proper to strengthen the Fund-Bank system. One might point out that in the Social Development Summit it has been mentioned that efforts would be made "to reduce the negative effects and to improve the positive impact" of the SAPs in order "to make them more sensitive to the needs of social development". But this argument cannot be overemphasised to be optimistic about the SAPs primarily because, as pointed out by Kitazawa Yoko to the delegates of the Copenhagen Summit, the programmes are a product of a specific kind of economic model/framework which, being obsessed with growthism and 'free' market, cannot be on friendly terms with the idea of social development. Even if the advocates of the SAPs continue to argue that the programmes in recent years have become more humane, thus tacitly acknowledging their de-humanising role in earlier years, the aggravation of the plight of the debt-ridden countries – a result of the imposition of the conditionalities associated with the SAPs – prove otherwise.

In visualising an impossible and implausible compromise between the demands of the prevailing economic order and the imperatives of human/social development, the summit-led humanitarianism advocates the opening up of all areas of economy of the developing countries to the transnational corporations (TNCs), with the expectation that the TNCs would make themselves 'humanised'. Having an 'impressive' record of political interference of showing utter disregard for the laws, society and culture of 'backward' states and the people of 'primitive' societies, and of creating environmental havoc (as the case of Bhopal), the management of the TNCs might find it very difficult to refurbish the familiar image of their organisation even if they wish to. Moreover, developing a humanistic outlook in the prevailing economic order which is based on cut-throat competition for control of the market would not ensure any substantial return in terms of profit.

That the summit-led humanitarianism would hope to make the Fund-Bank system and the TNCs more 'humane' is not surprising considering the fact that its ultimate aim is to create, as stated in the Copenhagen Summit, a "socially equitable liberal economic order" It is worth noting that in trying to reverse the history of global development by making the liberal economic order 'socially equitable' the recommendations do not suggest any change in the composition of the Fund-Bank structure. Thus it rules out the possibility of tilting the balance in favour of the least developed or developing states. It is also as part of the effort to keep the structure of the neo-liberal world order undisturbed that the summit-led humanitarianism adopts a very favourable view of the GATT — the third part of the 'trinity' of the inequitable world order While we do not want to repeat here the details of the controversy relating to the Uruguay Round of the GATT what must be reasserted is that in spite of the endorsement of the Round of almost all the developing states at Marrakesh on January 1 this year the recolonisation process in the sphere of world trade, as initiated by the architects of the Round, would ensure subjugation, not just subordination, of these states to their developed counterparts.

To refer back to the too frequent recurrence of meets dealing with humanitarian issues one can try to trace the motive in terms of an organised endeavour to repeat the conservative recommendations to drive home the point that the prevailing world order is 'liberal' enough to accommodate human/social development. We can refer to another instance to substantiate the same point, while the Agenda 21 of the Earth Summit – recognised as the most comprehensive document on human/social development – was prepared in 1992, was there any necessity to repeat most of these points and issues in preparing a charter of social development during the Social Summit in 1995? And that too without providing any account of the progress made during the last three years?

The suppression of women, as reflected in the history of human civilisation, knows no boundary; it is being carried on from time immemorial in all parts of the world with equal intensity, transcending all cultures. This has led us to be accustomed to viewing things and conceptualising issues by completely excluding the experiences and perspectives of women, as if they did not matter. The world has always been a man's world because the 'reality' in both the ontological and existential senses has been constructed by man. To recall Sandra Harding's celebrated comment, we have so far asked only the questions about social life that appear problematical from within the social experiences that are characteristic of man. It is highly encouraging for those concerned with the status and role of women that gender issues are increasingly gaining prominence, having passed those days when, in Sheila Rowbotham's words, they were "hidden from history". However in the days of aggressive globalisation, with everything measured and valued in terms of consumerism, the task of countering what Frederique A Marglin describes the "repressive entailments of society" – namely, the ideology and reality of domesticity – and of developing women's minds to assure their achievements in the public sphere will be met with stiff resistance from those who gain from the prevailing inequitable system. After all we live in a world where we have instances of governments indirectly initiating pre-teenage girls into prostitution in south-east Asia to promote international tourism and improve foreign exchange reserves.

If the Beijing Conference, following precedents set by summit-led humanitarianism, recommends only cosmetic changes to the existing gender-related norms and practices, by conveniently avoiding deeper and harder explorations, no purpose would be served. We need to take cognisance of the fact that the issues of everyday life, including those pertaining to women, do not exist solely at the level of 'practice'. They have a real, even if apparently invisible, methodological link to the constitutive logic of the existing order and its orderly mode of operations Thus, female infanticides or cases of bride burning in India, or the organised promotion of girl-prostitutes in south-east Asian countries or wage discrimination against women all over the world or lack of access of women to education and health care cannot be viewed sectorally These are only the 'symptoms' of a discriminating order which, lacking in gender balance, discourages women from meaningfully participating in the decision-making process. But the problem is when social relations and institutions tend to become 'reified' we create and perceive the world through the 'mask of reification', without raising or letting others raise questions and doubts about relationships or ideas that give rise to inequality, oppression and tyranny. The process of reification, in course of time, contributes to paralysis of perception, causing us to lose the transformatory zeal. If the participants in the Fourth World Conference on Women decide to do something drastic in the sense of being constructive, they should go beyond the rhetorics of transformation. The dominant development discourse has always been long on rhetoric and short on sincerity. To reinstate the same, in accordance with the 'tenets' of summit-led humanitarianism, will be essentially self-defeating.

KASHMIR

Caught between the Army and 'Guest' Militants

Gautam Navlakha

On one side is the security apparatus aiming to crush armed and unarmed Kashmiris because they are Muslims. On the other side are the 'guest' militants determined to convert a national movement into a religious war. Between the two, the voice of the Kashmiris for 'azadi' is getting drowned.

AT the end of May 11 the ledger of Indian nation-state contained the following account of Charar-e-Sharief: 1,310 houses destroyed, 1,460 families rendered homeless, and the shrine burnt down. Twenty militants, including Mast Gul, escaped the army dragnet. Troops displayed 9 bodies out of the 29 militants allegedly killed and claimed there were no civilian casualties. But five bodies turned out to be those of civilians. At the other end, months after the event, relief and rehabilitiation work is crawling along. Let alone compensation, interim relief has not been distributed to 370 affected families before disbursement was halted. Whereas 1,310 houses were gutted compensation will be provided to 842. Meanwhile, delay in disbursement means that with autumn just a couple of months away reconstruction of houses cannot begin until next year.

The shrine and its surrounding habitation of 26,000 once were a fulcrum of activity. Two hundred buses visited the town daily. And livelihood of people was intimately tied to the shrine. Not much remains. There are few visitors and little sign of life. The destruction reminds one of a war zone. Debris and burnt out remains had replaced mohallas on the three sides of the shrine which were home to a quarter of the town's population. Instead of the mosque sections of walls remain, and instead of the 500-year old rosewood ziarat a makeshift tent covers the 'mazar' of Sheikh Noor-ud-Din Wali. Where crowds once filled the precincts, only vast empty grounds remain. The bus-stand with eateries and other shops all along the wall of the shrine look forlorn.

Destruction of the two Charar-e-Sharief known for the ziarat of Sheikh Noor-ud-Din Wali, patron-saint of Kashmir, could have been averted, if the objective was removing the 30-40 militants. By granting 'full authority' to the army, prospects of a peaceful settlement took a backseat. Army prohibited journalists and 'outsiders' from entering the town. As the PUCL-CFD report points out a 10-member committee formed by the townspeople acted as a go-between the militants and the army to thrash out an agreement for safe passage. But the local army commander thwarted every possibility of this. In fact after agreeing to hold direct negotiations for which a 48-hour ceasefire was worked out army began firing (*The Hindu*, August 10). If the militants had shown unwillingness to negotiate safe passage then their motives could have been questioned. In its absence, army's actions call for a thorough probe for failing to give priority to protecting the people, the shrine and the town.

Aftermath of Destruction

True, there is no agitation over Charar-e-Sharief any more. But rage has been replaced by grief. Curfew, suppression of every demonstration of anger or sorrow, arrests of leaders, past experience of firing on crowds by the security forces, all combined to stop protests. But people are also hamstrung by the lack of empathy exhibited by Indians for them and their loss. Those who lament the demise of 'Kashmiriyat' entertain no doubt over official narrative. The 22-member parliamentary delegation which visited Charar-e-Sharief posed no questions when people accused the Indian army of the destruction. Their statement issued on May 20 limits itself by asking the governor about the "alleged inaction... in foreseeing and forestalling the happenings". Militants had been present in Charar-e-Sharief since last October but the MPs did not find it intriguing that the army began its operation on the last three days of Ramzan, including Id-ul-Zuha. What was the hurry after claiming the militants were planning to blow up the shrine? The MPs in fact entertained no doubt that the shrine was burnt by Pakistani agents. Once the prime minister clarified that the government of India (GOI) never orders inquiries into the operations of security forces they readily agreed. This meant that once security forces are deployed to deal with insurgencies then their conduct is subject to no restraint. When this is combined with the callousness of the parliamentary delegation which spoke of providing 'liberal assistance', having no time to re-visit and find out about relief and rehabilitation, one can hardly fault the Kashmiris for feeling that the articulate Indians want Kashmir not Kashmiris, and therefore, do not care what happens to them. Willy-nilly every Indian has become an accomplice in the crime of suppressing the democratic right of Kashmiris to opt out rather than accept terror and misrule.

The visit of the US envoy Frank Wisner in June also drove home the point that 'national' interests remain the paramount concern which inform relations between and within nation-states. Of course, no one interrogates the premises and claims of 'national' interests. Notwithstanding, all the scams, cover-ups, demolitions compelling introspection, even the cost of anti-insurgency has not been calculated. In suppressing militancy, escalation in the incidence of violation of life and liberties of people is inescapable. News of major conflagrations are difficult to squash when they occur, which they do at regular intervals. Western powers led by the US then trade off their non-intervention or acquiescence on Kashmir in exchange for climbdown by the GOI on major issues. From the GATT-WTO negotiations to patent regime, and intellectual property rights to opening of infrastructure and insurance sectors, all have coincided with increase in activity at the UN or some other international forum over Kashmir. The price extracted on account of coercive policy on Kashmir is not known but opening up of power, telecommunications, insurance would mean billion dollar businesses. Like it or not, Indians are being made to pay a high price for GOI's violent subjugation of the Kashmiri movement. Instead of rolling back military rule GOI seeks to contain any opprobrium they incur by managing the outflow of news. For instance, by focusing attention on BBC's coverage of Charar-e-Sharief, critical news was discredited, shifting attention from the tragic event to its 'distorted' coverage. BBC's shoddy news editing came in handy. But Indian print and visual media participated unmindful of the need to examine their own pre-suppositions. This resulted in the government's evasion of accountability to their people or the international community. All this contributes in silencing Kashmiris.

Behind all this is a policy that privileges *militancy* over the *movement* and therefore denies the need to address the basic issue of people's alienation. Herein lies the intrinsic failure of the policy of coercion because such an undemocratic response cannot distinguish between armed and unarmed people. No family in the valley has escaped being affected by it. Out of an estimated 20,000 deaths in past six years maximum number have been of civilians caught in the crossfire. No less than 11,000 'militants' are in detention. Former chief of intelligence bureau, M K Narayanan, wrote in a paper presented in 1994 that 70 per cent of the 50-60,000 Kashmiri yough, i e, 35-40,000, who crossed over to Pakistan had been 'neutralised'. (*The Hindu*, November 18, 1994. This could mean anything from their annihilation to their arrest. As a result, popular estrangement has been aggravated and militancy has grown. He also wrote that 'terrorist incidents' rose from 400 in 1988 to 5,000 in 1993. And that in first half of

1994 there were 4,200 such incidents. During this period number of militants rose from less than 300 to 12,000 and central government forces from 3,000 to 5-7 lakh! In Doda district until last year there were 4,000 securitymen; now there are 20,000, including the Rashtriya Rifles. Militants have become stronger say local officials (*The Tribune*, July 30). For instance after militants overran a RR camp in Puneja village (Bhaderwah) recently, RR picked up 300 youngmen. Fifty were so badly tortured that they had to be admitted to Bhaderwah hospital. This will provide new recruits for militants. This confirms that 5-7 lakh soldiers, bunkers, checkpoints, searches, arrests, torture, and killings cannot contain militancy. Despite this overwhelming evidence indulgence is shown towards hardliners.

Going by appearances, the daily grind prevails over 'azadi'. People appear to be leading a normal existence. With this has grown the official belief that people desire peace rather than a peaceful solution. But appearances can be deceptive since there is an element of getting used to militancy. Admittedly there is disgust at many acts of the militants. But this does not amount to disavowal of their political aspiration to opt out of India. Indeed the surface calm is misleading and the heavy hand of the military is evident everywhere. For instance, in public or privacy of home a Kashmiri can be asked to show proof of his/her identity including children above the age of six. For border areas there are special IDs provided. In the valley of approximately 35 lakh population there are anywhere between 5-7 lakh security forces, i e, a soldier for every five to seven Kashmiris! In addition there are bunkers at major crossings, and multiple checkposts on the highways which provide enough opportunity for delay, corruption and harassment. Worse, there is no insurance against a force taught to treat every Kashmiri as an enemy.

In other words Article 21 of the Constitution (right to live with dignity) does not apply for Kashmiris. No distinction is made between those who use guns and those who voice their desire to opt out of India. Democracies recognise the difference between the two and neither permit its blurring nor waive proper legal proceedings. But Jammu and Kashmir (J and K) is governed by arbitrary rules. Once "you deny the distinction between essentially different types of the same crime, then you deny the crime as distinct from the law and you do away with the law itself". Therefore, "an undifferentiated harshness destroys all the effects of punishment for it has destroyed punishment as a consequence of the law". Such is the state of lawlessness that the administration shows utter contempt towards the courts including the J and K High Court's orders related to habeas corpus petitions. Thus, fewere people, including lawyers, come forward to talk and narrate their experience. Fear is expressed about being hauled up by security forces if they are discovered talking to the press, people's right activists or for filing FIRs. The last is a basic right of everyone in a democratic society. But to gloss over this, and as part of psychological warfare, state administration has taken to 'investigating' allegations of atrocities. In what can only be considered cynical, the agency against whom charges are levelled is asked to submit its account which is accepted as the authoritative version. This enables a fair degree of news-management.

Fall-out of Anti-Insurgency

A major divide in J and K today is between those who believe that guns alone can win for Kashmiris their right of self-determination and those who argue that it can only be a part of a struggle that the movement undertakes for achieving its objective. From the heady days of early 1990 when lakhs protested on the streets and a million marched to Charar-e-Sharief to years when the gun ruled, the movement reached a point where a section of leadership began articulating the need for more political action. Until 1993 few Kashmiri leaders were willing to or dared to leave the valley for addressing meetings or press conferences anywhere in India. This changed after 1994 and by early 1995 a number of well publicised visits and meetings took place in which Jammu and Kashmir Liberation Front (JKLF) and Hurriyat leaders participated. Indeed, release of Yasin Malik, Shabir Shah and the return of Azam Inquilabi helped this process. Shabir Shah after his release first visited Jammu and the camps of migrants to begin his political campaign. Indeed, they insisted that the movement must begin to acquire a political profile by meeting, discussing, and informing public in J and K as well as outside the reason for demanding the right of self-determination. It is true they did not spell out their programme but insisted that they were committed to building a democratic J and K and asserted their right to self-determine their future. This manifested a political maturing of the movement and helped to blunt the thrust of Indian propaganda that had presented them in demonic colours. Ironically, if GOI was sincere about a negotiated solution it ought to have encouraged this process. Not only was this response not forthcoming but GOI went ahead to humiliate leaders who spoke of guns as not providing a complete answer. Four months after Azam Inquilabi laid down arms and returned from exile in December last, BSF raided his house to search for guns and then arrested his advisor Jehangir Butt. Expectedly, the very next day militants visited him to ask if he still believed that GOI could be persuaded to start a dialogue without the help of the gun. This process was most dramatically brought out during Charar-e-Sharief impasse when GOI opted for confrontation by disallowing JKLF and Hurriyat leaders from visiting the town to persuade the militants to pull out. They were beaten up and detained. This once again made the gun appear as a more attractive proposition for the youth pushing the need for initiating other forms of struggle to the background.

To this must be added the inability of the movement to bring the gun under their control as exemplified in the escalation of internecine killings. The 'civil war' has reached a stage with breakaway groups from Ikhwan-ul-Musalmeen or Muslim Mujahideen targeting Hizb-ul-Mujahideen (HM), whom they regard as their main enemy, thus depleting the ranks of local militants. These renegade militants operate with official blessing for their kill and loot operations. On July 6 four journalists were kidnapped from heavily fortified Pratap Bagh, in the heart of Srinagar, past several checkpoints and bunkers, by Kuka Parrey faction of Ikhwan. The grouse of the abductors was that whereas the newspapers carry the handouts of HM, their rival they are provided no space. Tired of this, newspapers began retrenching staff and toyed with the idea of suspending publication until militants sorted out their differences. That the matter was sorted out, for the time being, suggests that the leadership and people are trying to resolve their predicament. But they have not met with the same degree of success in their dealing with the 'guest' militants who have begun to play an assertive role.

HM remains the largest militant group but even here the 'guest' militants occupy key roles as exemplified by Mast Gul in Charar-e-Sharief. But the organisation most in news lately is Harkat-ul-Ansar which is active in several countries including Bosnia, Tadjikistan, and Afghanistan. These 'guest' militants remain outside the control of all the political groupings and take independent decisions which evern now and then jeopardise vital interests of the movement. The latest being the beheading of Norwegian hostage by Al Faran on August 13 and the little noticed killing of four local hostages the same day. This also came to light in Charar-e-Sharief where Mast Gul despite being 'advised' by HM leadership to walk out stayed put because GOI's offer of safe passage was found 'insulting'. Significantly, unlike early years of the movement 'guest' militants are largely responsible for a number of kidnappings. Indeed, according to Hurriyat leader Maulana Abbas Ansari, Al Faran, said to be the front for Harkat-ul-Ansar, had also demanded ransom money for the five hostages. Pahalgam (besides Doda in Jammu region) is one of the main area of HUA's operation and they have refused to condemn taking of captives because in Doda district they have been involved in kidnapping for ransom, killing of hostages, etc. Of course, Hurriyat leaders have condemned these acts and maintain that this has "damaged the cause". In order to distance themselves, they called for a strike on August 16 in the valley to express solidarity with the four hostages left. Significantly, it is HUA that decided to disrupt the pilgrimage to Amarnath cayes ignoring the appeals of Kashmiri leaders not to do so. They have also accepted the

responsibility for the July 20 and 26 bomb blasts at Jammu in which 18 persons died and for four of bomb blasts during the yatra.

The political fall-out of this is that GOI's efforts to project the issue in communal terms is now reciprocated by 'guest' militants. Not only do the 'guest' militants undertake actions that target civilians but their foreignness goes a long way to substantiate GOI's propaganda that J and K insurgency has little local roots and is Pakistan-inspired. Thus, the enemy is now both foreign, fundamentalist, cruel, and undeserving of any sympathy. But by refusing to distinguish between the political leadership and the populace from the 'guest' militants the entire movement has been projected as communal at the ground level. As a result none questioned the advisability of letting 'Hindutva' forces lead the pilgrims to Amarnath yatra which resulted in frequent clashes with Kashmiri policemen, ponywallahs, shopkeepers every time something went amiss, a bomb exploded or there was mismanagement, simply because they were Muslims. Hindutva musclemen charged them with being Pakistan's agents. Officials did not bother to project or inform the citizens that these people were braving the warnings of the 'guest' militants. And unlike the pilgrims these Kashmiris will continue to live in the valley. Thus, on the one side, is the security apparatus which sees its task to crush armed or unarmed Kashmiris because they are Muslims. On the other side, are the 'guest' militants, backed by organisations which operate autonomously and determined to convert a national movement into a religious war. For both sides secular democracy is anathema. It is also important to recall that in the first phase of anti-insurgency GOI targeted JKLF. This enabled HM to consolidate its hold. The second phase focused on HM thus enabling the 'guest' militants to get an upper hand. Because of this more troops were deployed, clashes mounted, atrocities rose phenomenally, and more youth joined the ranks of militants. In such a climate, the three-tier action plan – of putting a tight leash on the civilians; of encouraging renegade militants to unleash a fratricidal war; and allowing 'guest' militants to gain pre-eminence – signals a brutal turn to events. The lesson of Charar-e-Sharief is that Indian security forces will not flinch from destructive operations whereas the 'guest' militants will fight unmindful of the interests of the movement. An Afghan-type war for gaining the upper hand can get enacted in which no side will give any quarter. Obviously, security forces overrate their capacity to master every situation notwithstanding monumental failures like the one at Charar-e-Sharief or inability to track down five foreign and 30 local hostages so far. But between the Indian troops and 'guest' militants voice of Kashmiris gets drowned; be it their political demand of right of self-determination or their protest against atrocities. This suits the GOI.

The GOI presumably believes that sooner or later the leadership of the Kashmir movement can be compelled to accept the offer of GOI to 'consider' quantum of autonomy once 'elections' are held. From the reasons cited for on-now-off-again elections for the past one year, it is clear that the postponement of elections was based on contingent factors and not on any strategic re-thinking. And now that the US and the EU envoys are hammering home to Kashmiri leaders that they see elections as serving a useful purpose, GOI is convinced that it can repeat an Assam or a Punjab. Elections will not be supervised by a neutral agency but by the security forces people despise. However, the belief that people will surrender their goal of 'azadi' may be misplaced because the Kashmiris justifiably mistrust New Delhi. It has been a matter of state policy right from the start to erode internal autonomy of J and K Beginning with opposition to 1948 radical land reform on grounds that it targets non-Muslim jagirdars and smacks of communism, legal assimilation started with presidential orders of 1954: (1) The J and K Constitution (Amendment) Act 1954 deleted section 75 of the J and K Constitution Act 1939 which had made the council of ministers the final interpreters of the J and K constitution. Thereby the Sadar-i-Riyasat, i e, the governor, acquired this power; (2) The Constitution (Application to J and K) Order 1954 was issued by the president whereby the jurisdiction of the centre was extended from the original three subjects of "Defence, Foreign Affairs and Communications" to all subjects on the union list along with the residuary powers. These orders were passed on the same day – May 14, 1954. They violate the very first provision of the Delhi agreement (July 24, 1952) which have J and K a special position within the Indian union by conceding that "sovereignty in all matters other than those specified in the Instrument of Accession continues to reside in the state". The 1954 orders extending the powers of GOI included two important provisions: it outlaws any activity which disclaims, questions or disrupts the "sovereignty and territorial integrity of India" and any "insult to the Indian National Flag, the Indian National Anthem and this Constitution" is deemed to be a treasonable act. Both these provisions were in accordance with the wishes of the RSS and its fronts which had been agitating for full merger of the state into India. A month prior to this, in April 13, 1954, customs barrier was removed and J and K became economically an integral part of India. Subsequent years saw extension of Article 312 in 1958 bringing J and K under All-India Services. By January 1965, Articles 326 and 327 enabling the centre to bring the state under the governor's rule without the consent of the state legislature was made applicable. And in 1966 governor Jagmohan 'concurred' with the centre's extension of Article 249 enabling the parliament to legislate on matters in the state list on the strength of a Rajya Sabha resolution.

This being the case, talk of constitutionally guaranteed autonomy is a non-offer. Admittedly, in the short-run a 'settlement' could be forced on Kashmiris. However, the ruthless crackdown which has affected every family only reinforces a reading of the past that is filled with betrayal and violation of every pledge made before the parliament, in the UN, and in public. But while GOI deals its cards the movement is not bereft of resourcefulness. For instance in spite of the best efforts of GOI to keep the movement divided, JKLF decided on August 10 to bury the hatchet and join Hurriyat Conference. The announcement was met by tumultuous ovation by two lakh devotees gathered at Hazratbal. This is all the more remarkable because just two days before this one more JKLF member was allegedly killed by HM. In other words, where there is repression there will be rebellion and where there is attempts to sow discord there will be counter-vailing efforts to close ranks. Besides, local and 'guest' militants will not vanish just because a patch-work arrangement is imposed. Paradoxically, there are forces who profit from the political-economy of anti-insurgency and have a stake in its perpetuation. The several cases that have come to light about the involvement of CRPF, BSF and the army in drug trafficking (*The Statesman*, August 14) shows what 'free hand' given to security forces can come to mean. Financial burden of Rs 2,000-3,000 crore annually on account of anti-insurgency is also of no consequence for those who desire cutback in social investments and augmentation of security apparatus. And yet it is those who profit that guide, if not dictate, government policy. Punjab shows the difficulty encountered in reining in a force which begins to hold on to its powers and profiteering ways. A recent incident highlighted the clout of security-intelligence apparatus. It criticised granting of visa to a Pakistan MP Maulana Fazlur Rehman on grounds that its opinion was not considered, that he was linked to HUA, and that this would demoralise the forces in J and K. Whether their allegations are true or false is not the issue. The point is their assertiveness to question a decision of GOI. It is important to note that notwithstanding their failure and no matter how big their crime, they escape all punishment or criticism in the name of 'national security'. No one interrogates the 'national' in security operations. Therefore, the crossroads at which the Kashmir dispute has been brought will not only reduce the chances of a democratic solution but threaten to carry forward subversion of democratic rights of Indians by the indulgence shown to military, para-military and intelligence apparatus by the GOI and the parliament. This is nothing but an invitation to another danger.

Vinayak Mahadeo Dandekar

Anand S Nadkarni

To describe Dandekar as an aggressive intellectual who used wit and sarcasm to win debates on issues of social importance is to do injustice to the essential humanism of the man. He was deeply interested in studying closely the country's social problems with a view to discovering how best they could be made more manageable, if not eliminated altogether. The focus of his attention was primarily the disadvantaged sections of the community and the approach was basically constructive.

VINAYAK MAHADEO DANDEKAR, the renowned economist, passed away in the early hours of Sunday, July 30, in Pune. A large part of Dandekar's working life was spent in the Gokhale Institute of Politics and Economics, Pune (GIPE). He succeeded D R Gadgil as director of the Institute and built on the firm foundations laid by Gadgil, the founder-director. For a long time before Dandekar took over from Gadgil GIPE was looked upon as a centre of research principally in agricultural economics. Dandekar tried to give the Institute a wider identity by opening new sections such as those in monetary economics, finance, study of socialist economies of eastern Europe and so on. In 1970, during the interregnum separating his two stints as director of GIPE, a very short one and a much longer one, he founded the Indian School of Political Economy (ISPE) at Lonavala near Pune After his retirement from GIPE in 1980 he devoted all his energies and attention primarily to developing the ISPE as a worthy centre for the study of Indian economy, polity and society. As a part of this effort, the ISPE started in 1989 its own periodical, *Journal of Indian School of Political Economy*, which became a regular quarterly in 1991. Both in terms of the nature and quality of its contents, the *Journal* has established an identity of its own, the credit for which has to go largely to Dandekar.

I came to Pune in 1955 as a lecturer in economics in the Brihan Maharashtra College of Commerce. Within a few months' time I came to know Dandekar at a meeting of the Economics Discussion Group consisting of economics teachers from the GIPE and Pune-based colleges, with D R Gadgil as the chairman. The group used to meet at regular intervals with one of the members reading a paper on an economic theme of his choice, to be followed by a discussion. I had an inkling from time to time of Dandekar's wit tinged with sarcasm whenever – and that would be quite often – he expressed his views on the paper being discussed. There was another and wider forum, Poona University Social Sciences Teachers' Seminar, which met once a year to discuss papers prepared on themes fixed sufficiently in advance. At these meetings also Dandekar made his presence felt by his critical comments based upon a careful reading of the papers submitted. During these meetings as a paper writer I had my share of confrontations with Dandekar It was however during the last nearly 20 years that I came to have a closer association with him as a colleague, first in the GIPE and later at the ISPE

Dandekar was not formally trained in economics when he studied for degrees at the Nagpur and later Calcutta Universities. But his training in mathematics and, particularly, statistics during his university days must have helped him substantially when he embarked on a career in empirical economic research by joining the GIPE in 1945. He developed almost an uncanny insight into the tables of data he came across, and over the years he also widened and deepened his perception of ground level realities of Indian economic and social life by getting into close contact with the common people, political and social workers, government officials, teachers, particularly in the rural areas. But his forte, in my view, was his incisively logical mind. This enabled him to see more clearly than many others the intricate interrelations between elements in a social/economic situation so that his analysis that followed was characterised by a refreshing elaborateness of relevant details presented in a logical sequence.

Dandekar was a committed social scientist always alive to the burning issues of the time in the country. His views on these issues arising from his continuous study were presented to the people through his writings and lectures in a frank and forthright manner. As a methodical social scientist he almost abhorred looseness in thinking, particularly among those considered knowledgeable. It was as if he regarded this looseness as indicating a lack of intellectual discipline borne out of some kind of mental lethargy. Dandekar would not tolerate this, and subjected it to frontal attack in his writings and in seminar discussions. There was one more thing which he disapproved of that struck me particularly as I worked with him as executive editor of the *Journal*. This was the common tendency among many authors to display their knowledge by quoting extensively from others, particularly foreign authors, without much justification. On subjecting papers sent for the *Journal* to initial scrutiny Dandekar recommended to authors deletion of such unnecessary quotations in order to make their papers more compact. He was more interested in what the author himself had to say on the subject than what the author knew someone else had said. The identity which the *Journal* gradually developed has much to do with this and several other types of editorial interventions by Dandekar.

Over the years a host of social/economic issues engaged Dandekar's attention, such as poverty, unemployment, water scarcity in Maharashtra, regional imbalance in Maharashtra, the rapidly declining standards in education, the aborted experiment in democratic decentralisation, reform of the electoral system, mind-boggling problems facing women, ban on cow slaughter, pricing of agricultural products, the current experiment in economic liberalisation and so on. Some of these problems, for example, cow protection, or even regional imbalance in Maharashtra are issues on which many people have strong views on sentimental grounds. There are others such as water scarcity in Maharashtra or pricing of agricultural products in the case of which dispassionate objective analysis may not be liked by vested interests. But Dandekar spoke out his mind on several issues without any compunction. In fact, sometimes one felt that he used wit and sarcasm in his presentation with a view to raising a controversy hoping that the debate that followed would generate not merely heat but also some light. It may probably be argued that if Dandekar was much less aggressive in his presentation he would have had a more pliable audience, and this would have helped his mission of educating the people. On the other hand, it is also plausible to say that with people sticking to their prejudices or with vested interests impeding objective assessment, Dandekar felt that only by giving them some kind of a rude shock could people eventually be made to think more clearly and try to comprehend reality. It is difficult to judge which alternative course would yield better results. Every thinker makes his own choice on the basis of his assessment of ground realities as also his own temperamental compulsions.

Dandekar was known for his abiding sense of humour. I remember Dandekar once recounting to us at the tea table at the GIPE with a mischievous smile on his face what a well-wisher said to him when after his first short stint as Director, GIPE, he stepped down on account of differences and started the Indian School of Political Economy. The well-wisher said that though he could quite understand Dandekar's decision to start a new institution, having drifted away somewhat from the GIPE, he (the well-wisher) was at a loss to know why he started a school and not, say, a college! But Dandekar's humour was not always so innocent. In academic encounters he used biting humour as a potent instrument. One may recollect the headings he gave to some of his papers published in the *EPW* joining issue with scholars on themes of current interest. It is likely that many of those who were at the receiving end were irritated, if not angry, on account of this. But it must be said in fairness to Dandekar that the object of his ridicule was not the person who wrote, but the argument which he advanced. What is more, there was one more trait of Dandekar which

I observed. Sometimes in the heat of an argument Dandekar, getting angry, would raise his voice but if, as the argument proceeded he recognised the merit in the argument of the 'adversary' he would back down and redress by owning his mistake. Hence despite bitter academic encounters with him many persons continued to remain his friends.

Dandekar was no respecter of radical social philosophies. He had a poor opinion of socialism, and so also of Gandhism. I always felt that he had not fully thought out his ideas on these subjects. As an Indian economist he was appreciative of the need for economic liberalisation in the country, though he had strong reservations about the way the policy was being carried out by the powers-that-be. He had forthright views on public sector undertakings (PSUs) in India, 'a sacred cow' of the socialists. Considering that PSUs as a group have been loss-making, Dandekar advocated a policy of disinvestment by government in this area and of using the financial resources yielded to repay as much of the public debt as possible with a view to reducing the burden of public debt. He agreed that a PSU may be handed over to workers if they agree to run it at their own risk.

Though Dandekar was thus critical of radical points of view he was quite in sympathy with the basic objective of radical action, viz, promoting the well-being of the disadvantaged sections of the Indian Society. Dandekar included among the disadvantaged section the poor of the land, workers in the unorganised sector and women. He left out the workers in the organised sector of industry as, in his view, these workers were in a position to use their collective power to extract from the oligopoly enterprises a share in the surplus earned at the expense of the really disadvantaged. He came down heavily on several of the trade unions of organised workers which, time and again, held the society to ransom to get a rise in their rewards. In this respect the radicals have a perspective different from that of Dandekar. The trade union movement, to them, is another 'sacred cow'; in consequence they back all types of labour organisations in their exorbitant demands, failing to realise that this trade union action, if successful, would work to the detriment of the really disadvantaged whom the radicals should, in fact, support. Dandekar surely was more consistent in his approach.

In the case of women Dandekar was keenly interested in organising discussion on the conditions of women in India and the probable measures to remedy the situation. The ISPE therefore convened at its Lonavala campus at one time a series of seminars on the subject in which even a number of rural women actively participated. The presentation of their experiences by some of the articulate women participants was eventually published in the form of a book in Marathi *Because I am a Woman*. Dandekar rightly pointed out that women, particularly rural women, suffered immensely because they had to spend a lot of their daily time bringing drinking water over long distances and hunting for fuel for cooking purpose. He expected society to consider these problems with a view to easing the burden on women. Though, many times, Dandekar seemed to make fun of some of the (what he considered as) extravagant statements of women activists he was in a crucial sense a feminist. It is interesting to note that one of his suggestions in the field of democratic decentralisation was that the village panchayat should have only women representatives.

All that precedes indicates that to describe Dandekar as an aggressive intellectual who used wit and sarcasm to win debates on issues of social importance is to do injustice to the essential humanism of the man. He was deeply interested in studying closely the country's social problems with a view to discovering how best they could be made more manageable, if not eliminated altogether. The focus of his attention was primarily the disadvantaged sections of the community The approach was basically constructive I may cite here an illustration of Dandekar's desire to solve a problem to the satisfaction of those who are at the receiving end. Once during his tenure as director of the GIPE a number of MA (Economics) students of the Pune University complained to the vice-chancellor that they failed because of unduly strict assessment of answer-books by some examiners. The vice-chancellor appointed a committee consisting of the dean of the relevant faculty and Dandekar to go into the complaint and report. Dandekar, however, persuaded the vice-chancellor to call an open session to be attended by interested teachers and students in economics in institutions affiliated to Pune University. The idea was that in this open session the answer-books of the complaining students in the different question papers in economics would be read out (without revealing the identities of the students), and students present would themselves be asked to state how many marks could reasonably be given to a given answer to a particular question. Some of us teachers from GIPE attended along with Dandekar; there were some teachers from colleges and a few students. Interestingly, some student activists also made it a point to attend. As the reading went on the students present (not necessarily all of them were the complaining ones) came to realise that many of the answers were totally irrelevant, quite a few of the answers, though not exactly irrelevant, were imprecise, and that generally the organisation of the material presented was far from satisfactory. As all this gradually became clear, student activists beat a hasty retreat, but the students stayed on, heard patiently and agreed that the assessment had not been at all unduly strict. This itself was education for many of those present.

Dandekar, in fact, was essentially an educator in the widest sense of the term. In the initial period the major activity of the ISPE at Lonavala was to train political and social workers, people's representatives in local bodies, government officials in different areas of work, all this with a view to improving the tone of decision-making at the grass root level. Dandekar spent a good amount of his time pondering over the problem of deterioration in the field of formal education, particularly, at the higher level. His analysis of the problem is to be found in his R S Dubhashi Memorial Lecture, 'Reform of Higher Education', delivered at the Pune University on January 19, 1991. As he saw it, the two aspects of the problem which needed to be considered were: (i) "how to make the teachers in the colleges and the universities more accountable for their duties, particularly towards their students"; (ii) "how to make the students more responsible for their studies". Whether one agrees with his formulation or not, here was a serious attempt to think out in details the probable lines on which, according to Dandekar, the system of higher education in the country could be gradually brought on the rails. He circulated among his friends and colleagues at the ISPE and outside a number of ideas for taking quality education to the needy, particularly in the rural areas. One part of this process would be to bring out pamphlets on various doctrines (socialism, liberalism, etc) in Marathi. He felt, however, that it was not advisable to get these written by Marathi authors, as a sufficient number of such authors well-versed in the subject and capable of writing in simple Marathi in a lucid manner may be wellnigh impossible to find. He therefore floated the idea of getting lucidly written material in English by mature scholars translated into Marathi. These translations properly touched up by linking the material to the Indian context could then be published to the immense benefit of readers in Marathi. This idea, however, foundered on the rock of impracticability as adequately competent translators familiar with the nuances of both the languages and with the discipline of social sciences are also likely to be a rather rare species. Recently he was working on a scheme of preparing by the ISPE of video cassettes on expository lectures on different topics in, say, economic theory by well known experts in the subject in India and making available these cassettes to colleges on a 'no profit, no loss' basis. In his view this facility would help improve understanding of the subject both by teachers and students in a college. In fact, a part of the proposal was that there should be a feedback from teachers and students to the ISPE on specific difficulties they encountered in understanding the material, so that continuous revisions could be made.

Dandekar was interested in many areas of knowledge other than the social sciences. He had prepared a scheme for verifying whether predictions of astrologers could be tested statistically. He had collected for the purpose a large number of horoscopes to work on as also information on such exercises made elsewhere. He was a connoisseur of sorts of Hindustani music; some time in early life he had written some plays as well. The thought that this many-sided personality, versatile, imaginative and dynamic has left us all for ever is a saddening one. But if we can emulate him even to a small extent in undertaking the task of educating society with the determination and fearlessness which he displayed we will have paid him a well deserved tribute.

Constructing the 'Local'

Decentralising Forest Management

Ajit Menon

While the concept of joint forest management is certainly a step forward from the centralised state-centred management systems, is it as participatory and decentralised as it has been claimed to be? What has been the experience of Tamil Nadu in implementing the concept?

THE latest Draft Forest Act (The Conservation of Forests and Natural Ecosystem Act) has over the last year once again brought to the fore debates with regard to principles of forest management. Since the late 1970s and the 'Arabari experiment', increasing emphasis has been placed on people's participation and joint forest management (JFM) strategies. The 1990 central government order directing state governments to encourage the involvement of village communities in the regeneration of degraded forest lands was in a sense an official acceptance of such strategies. The Draft Forest Act, to many, therefore is a blatant challenge to that directive as it not only has no mention of joint forest management but restricts discussion of people's participation to the chapter on village forests and that too with far-reaching powers to the state.*

Despite endorsing the critiques of the Draft Forest Act, our intent here is to refocus the discussion on JFM in the hope of prompting further debate. While JFM is undoubtedly a step forward from centralised state-centred management systems, is it as participatory and decentralised as many profess it to be? If not, should we not pay more attention to improving it rather than positing the future of forest management as a simple choice between the Draft Forest Act and JFM? In what follows, we attempt to re-examine some of the criticisms made of JFM which seem to have fallen on deaf ears with reference to the Tamil Nadu notification. This critique suggests that while JFM intends to decentralise decision-making to the village level, the decentralisation process itself is based on a 'strait-jacketed' notion of what the 'local' is and should be. As a result, instead of allowing for 'local' solutions, JFM is in danger of imposing these solutions from the outside.

A wide range of literature already exists on joint forest management. These have generally been of the case study variety examining the actual functioning of JFM. Consequently, criticism of JFM has been largely restricted to the 'particulars' as opposed to the 'generals'. These particulars have been of three kinds. First, criticisms have focused on the process of implementation itself. Wide divergencies seem to exist based on individual initiatives of forest officials and local leaders. Thus, in cases where local initiative is greater, the implementation of JFM has proceeded more smoothly. A second criticism is that the devolution of powers to forest protection committees (FPCs) has often been restricted to providing employment opportunities and a few usufructuary benefits as opposed to involving people closely in the planning process. It is suggested therefore that it is necessary for the forest department to actively help village communities develop their own micro-level plans. Third, in many cases, what has happened is that though JFM has meant to decentralise, the imposition of a definite structure in terms of a state order has restricted the flexibility of local involvement. (This has been reported in various issues of *Wasteland News*.)

However many of these problems stem from a conceptual problem with JFM itself. Chhatrapati Singh in one of the few far-reaching critiques of JFM made a number of relevant points. He pointed out that many of the usufructuary rights guaranteed under the notification already exist, most often in the form of customary rights which were 'legalised' at the time of the settlement. Therefore, by constituting village forest protection committees (VFPCs) and giving them special or overriding rights to particular forest areas, it is possible that others who do not fall within the domain of these FPCs are denied rights which might have existed previously. Moreover, it is possible that the rights given to FPCs conflict with rights which already exist amongst other local bodies such as community panchayats.

These shortcomings, as Singh rightly pointed out, is because the process of decentralisation in JFM itself has been packaged in an externally imposed framework. He says: "On the one hand the government talks of decentralisation and strengthening of rural institutions, such as the panchayats, and on the other the constant practice of setting up non-statutory, government-dependent committees in most areas of developmental (Chhatrapati Singh, 'JFM: Analysis of Forestry Notifications', *Wasteland News*, August-October 1991).

A careful look at the central government order will support this view. While the order calls for the involvement of village communities and voluntary agencies, this involvement is not free of 'supervision' from the forest department. In all state orders, forest officers are to play an important role in the constitution of these FPCs, in the functioning of them through range officers in the executive committee and in overseeing the functioning of the committee through divisional forest officers and conservators of forests. Moreover, the distribution of benefits between local communities and the forest department is determined by the latter (Government of India, Ministry of Environment and Forests, Order No 6-21/89-FP, June 1, 1990).

The Tamil Nadu government order on interface forestry (TN's version of JFM) dated October 21, 1993 is no exception to the rule. In terms of constituting the village forest council (as they are called in TN), "the forester in charge of the concerned Interface Forestry Unit Area as a convener will initiate the process of forming Village Forest Councile." (section 2). The forester in charge of the developmental activities will be the secretary of the executive committee. Furthermore, the divisional forest officer will have the authority to disband these councils. With regard to benefit-sharing, the forester/ranger/divisional forest officer in consultation with the executive committee will decide who are to be the beneficiaries and the quantity of the benefits per household (section 3). Furthermore certain items such as bamboo and small timber (classified as category B) will be extracted departmentally not locally and sandalwood remains exclusively the state's property (section 6). Finally, the divisional forest officer will monitor the functioning of these councils while the chief conservator of forests (social forestry) is expowered to modify any guidelines (section 7).

It seems therefore quite clear as Singh suggests that the content of decentralisation itself is limited. At one level, JFM seems to be giving more power to the local, but at the same time the state through the forest department assumes significant powers in terms of constituting, organising and monitoring FPCs. The proponents of JFM argue that it is a step in the right direction. And no doubt there is a noticeable attitudinal difference between those who function in the interface (social forestry) wing of the forest department in Tamil Nadu and those who belong in the territorial division. But that surely should not mean that JFM should not be scrutinised more carefully.

Singh's critique of JFM is essentially that decentralisation is embedded in centralised structures and therefore goes against the

spirit of panchayati raj. But his argument can be taken one step further if we look at how the 'local' itself is problematised. In JFM, the unit of functioning more often than not has become the revenue village or hamlet. Decentralisation or empowering the local involves giving certain rights to VFPCs who in exchange are involved in protecting the forests. Furthermore a defined area of 'forest' or 'jurisdiction' is given to these VFPCs in order to form a 'unit of management'. The question therefore should be as to whether this 'local' is a functioning whole or not, and if not, what the consequences of constructing it as such would be.

Constructing the 'Local'

Let me give an example. The Kolli Hills, where I am undertaking research at present, is an offshoot of the eastern ghats located in Namakkal and Rasipuram taluks of Salem district. It is primarily inhabited by Malayalee tribals (Malai hills) who are agriculturists There are substantial forest areas bordering the village settlements. It is important to note here that this area is not under interface forestry. Nonetheless, as more than 20,000 ha of reserved forests exist, mostly on the slopes of the hills but also on the plateau where the 14 villages are located, it is an area in which the concept of JFM is ripe for testing. If used as a testing ground, what would the implications of it be?

Traditionally, Malayalees of the Kolli hills had their own administrative system based on 'oor' panchayats. These panchayat bodies were part of an overall administrative system which governed the Kolli hills. They were locally constituted bodies autonomous from any other body outside the hills. Interface forestry seeks to create village forest protection councils. But in doing so, it is possible that the 'village' as an administrative category used by the forest department supersedes these locally constituted oor panchayats which might not always function within the same 'jurisdictional' limits. Though it might be necessary to have a locally-constituted body, that can best be decided by the local people. But by speaking specifically in terms of village committees in interface forestry, the final decision seems to rest with the forest department. Even if panchayats were to assume an important role as in West Bengal, these 'government' panchayats are something very different than the oor panchayats mentioned above. Moreover, in the Tamil Nadu case, these government panchayats have not had elections for many a year. Thus if forest protection committees are part of a package of decentralisation as they are meant to be, these committees should emerge locally. In many cases, traditions of collective action might already exist though perhaps not specifically with regard to forest management.

Let us briefly highlight a dangers in constructing a local from the outside. The assumption within JFM seems to be that areas of reserved forest can be given to villagers to protect and manage. It is assumed necessary to give VFPCs very clearly defined areas of jurisdiction. But it might be the case that the dynamics of the local economy results in local inhabitants getting produce from different forests. One example that comes to mind from the Kolli hills is that the administrative categories of the forest department have little meaning for local people. Not only do people enter different forest areas for obtaining different forest produce, but there is also no clear sense (based on my preliminary research) that particular hamlets have areas exlusively designed for themselves. Defining forest areas therefore is problematic given the fact that perceptions of what a forest itself is might vary. JFM in its present form is a management package. Giving a particular village or hamlet a defined forest area is simpler in terms of practicality. But it might not represent the local reality. It is also important to keep in mind that the Kolli hills is a biodiverse area. To what extent does JFM give communities substantial guarantee that their usufructuary rights will be granted in the wake of debates on intellectual property rights and potential legal changes with regard to use and ownership of resources? After all these committees are non-statutory and the villagers' rights simply that of usage.

Finally, in constructing the local, it is important also not to examine the forest independent of its larger whole. Though in many areas of the country it seems to be the case that usufructuary rights have changed people's relationship with the forest, assuming so might not be correct. Preliminary analysis of land use data in the Kolli hills seems to suggest that certain forest lands have become either cultivated lands or cultivable wastes. Under the directive of the Tamil Nadu order, the forest department could conclude that 'local' people are performing their operations (preservation) unsatisfactorily. But how are we from the outside to decide that preserving forests as opposed to granting patta rights to forest land is preferable? Would it not be better to see how people's relationship to the forest is linked to their dependence on agriculture and how preserving forests might be linked to security of land ownership. JFM does not seem to leave space for this.

No doubt JFM is better than what proceeded it. But the 'local' that is constituted within JFM is a local which has been constituted by the non-local. As a result, whether the local itself represents in any real way the immediate concerns of those who constitute it is unsure. Though methodologies such as participatory rural appraisal (PRA) are increasingly being used to highlight local concerns, one must remember that these too still do not change the rules of the game set forth by the state. It would be more useful if the local could first define itself and then a structure be mutually determined as to how to engage in JFM.

This is not to say that the non-local does not have a role to play. There are very few studies which actually examine whether the traditions and principles of local use are ecologically prudent. Moreover, one has to keep in mind that the local has significantly changed not only due to external pressures but also due to internal ones which all has implications as to how the local will act when it comes to forest management. Nonetheless, attempts to restrict the local by assuming that the state knows better which is what not only the Draft Forest Act does but also JFM to a great extent is not the solution. Though JFM has spread to large areas of reserved forests throughout the country, only time will tell if these externally constituted FPCs will sustain themselves. And even if they do, one must ask the question as to whether the local is being fairly represented as most environmentalists and concerned others have tended to assume.

Finally, though our focus has been on the external construction of the local and its impact with specific reference to decentralisation, another important concern which we have only briefly touched upon is whether there is a single local in the first place. Though many argue that tribal societies are still relatively homogeneous, at least in the Kolli Hills an initial look at village records seems to suggest otherwise though to what extent is unsure. In our mind, however, these internal contradictions and tensions within the local will have to play themselves out. At best, what forest management (in terms of JFM) can do is to try and represent as best as possible the composite local. That composite local might take shape in the form of village forest protection committees as is the case with JFM at present. But it may also be the case that in order to 'protect' forest areas, different configurations have to take shape which not only looks at forming forest protection committees and giving usufructury rights and employment opportunities, but also addresses more fundamental questions of security of land tenure and ownership rights. If externally constructed solutions are to be the answer, they at least have to be locally specific. Does JFM allow for such flexibility?

Mobilising Direct Foreign Investment
Lessons from East Asia

V V Bhanoji Rao

Data from a recent ESCAP publication are instructive in regard to the sources of DFI, sectors attracting DFI and the factors determining DFI flows. It would appear from the available evidence that the government of India and the state governments have a long way to go in regard to raising the level of DFI inflows and fine-tuning the sectoral composition. The need is to put in place a set of appropriate policies.

I
Introduction

OVER the past three decades, there have been numerous studies aimed at describing the trends in DFI flows across countries and over time, ascertaining the causes behind variations in such flows and suggesting policy implications. A recent study belonging to the same category was put together by the UN Economic and Social Commission for Asia and Pacific [ESCAP 1995]. It has chapters covering Hong Kong, Singapore, Indonesia, Malaysia and Thailand. A short chapter on India too was included, along with an overview of all chapters.

The aim of this note is to assemble and present a couple of summary tabulations from the ESCAP study and based on them to draw inferences as to how the Indian strategy to attract relatively higher levels of DFI has to be formulated. There is no evaluation of the findings in the ESCAP volume. Instead, two of the main tabulations by each economy are consolidated and presented in summary form to obtain useful insights.

II
DFI Trends and Investor Views

The data available from the latest *World Investment Report* [UNCTAD 1994] indicate that in 1992, the following Asian countries received relatively high levels (above $ 1 billion of FDI (amounts indicated in parentheses): China ($ 11 2 billion), Singapore ($ 5.6 billion), Malaysia ($ 4.5 billion), Thailand ($ 2.1 billion), Hong Kong ($ 1.9 billion) and Indonesia ($ 1.8 billion). For the whole of the 1980s (actually 1981-91), average annual flows were as follows: Singapore ($ 2.5 billion), China ($ 2.1 billion), Malaysia ($ 1.4 billion), Hong Kong ($ 1.2 billion), Thailand ($ 850 million) and Indonesia ($ 514 million).

Singapore, more than any other economy, attracted rather high levels of DFI. Relative to population size, Singapore's DFI stands out even more glaringly. In 1992, for instance, per capita DFI was: $ 1,878 for Singapore, in contrast to $ 11 for China, $ 10 for Indonesia, and $ 36 for Thailand. Also, Singapore's per capita DFI was four times that of Hong Kong and eight times that of Malaysia. Even if India were to attract half of Indonesia's and China's per capita DFI, the annual flow could be around $ 4.5 billion. Since the post-1991 annual flows have continued to be less than or equal to about $ 1 billion, a concerted effort is needed so as to significantly raise the level of the flow.

Stepping up the DFI flow into India would imply that Japan has to invest relatively more. In general, Japan is not only the main source of DFI for the five East and South-east Asian (ESA) economies (Hong Kong, Singapore, Indonesia, Malaysia and Thailand), for four of them (excluding Singapore), Japan supplied a third or more of the total stock (Table 1). A fifth of the Singapore DFI stock came from Japan. In contrast, almost 40 per cent of 1991-94 DFI flows into India were from US with DFI from Japan accounting for only 9 per cent. Two more features also stand out. In the five ESA economies, the manufacturing sectors of DFI concentration are electronics/electricals and textiles and clothing, industries

TABLE 1: SOURCES OF FDI, SECTORS OF CONCENTRATION AND INVESTOR OPINIONS

Economy (Year)	Total Stock Source Country Share (Per Cent)		Manufacturing FDI: Sector Shares (Per Cent) and (Per Cent Exports to Sales)		Favourable (F)/ Unfavourable (UF) Factors Noted by Most Investors

that absorb relatively more human resources. In the case of DFI into India, the relatively heavy and capital-intensive industries have a larger share. Similarly, ESA economies' DFI sectors are also highly export-oriented, in contrast to the DFI into India. Thus, as far as India is concerned, the shying away of DFI into labour-intensive sectors is a major issue that calls for fine-tuning of DFI policies just as there is a need to address the issue of attracting DFI into export-oriented industries.

Investors' views from foreign affiliates or Japanese multinations are collected in a series of annual surveys and are reported in ESCAP (1995). Table 2 has a summary of principal responses, on a comparable basis for Hong Kong, Singapore, Indonesia and India for 1989-1993. If the data are accurate (this is hoped because of their extensive use in the ESCAP publication), they do explode some oft repeated myths and confirm some of the relatively well known hunches.

The recent popular literature on DFI is replete with (a) the importance of natural resources (especially in regard to destination countries like Indonesia) in attracting Japanese investments and (b) the strong Yen driving away industries from Japan to South-east Asia. The rather low importance attached to these two motivating factors is indicated in the 5 per cent or less responses scored by them.

In general, three factors emerge as the key motives for DFI inflows. They are selling to local markets, building international networks and reduce labour costs. Selling to Japan has hardly any significance as a motivating factor; the same is true of selling to third markets.

That Japanese outward DFI looks mostly for host country markets is brought out by the data on market shares. Even in Singapore and Hong Kong, the domestic market shares are above 50 per cent, while Indonesia and India have 64 to 65 per cent domestic shares. When it comes to export, Japan and third countries are emphasised, with sizeable Japanese shares. As for sources of material inputs, domestic economy figures prominently as a principal source in regard to DFI into India. Indonesia too shares this feature except that sourcing from Indonesia by the Japanese investors in that country is to a lesser extent than sourcing from India by the Japanese investors in India. Japan itself is the principal source of material inputs for the investors in Hong Kong and Singapore.

III
Towards Fine-tunning India's DFI Policy

The Indian domestic market share of 65 per cent in Table 2 indicates the fact that Japanese (and other) DFI is driven basically by the size of the Indian market. Just as the import substituting industrialisation strategy in the past failed to augment export orientation of the Indian economy, DFI too might simply replicate the same feature albeit to a lesser extent. There is a clear case for fine-tuning the incentives for DFI flows especially to raise their export orientation, while recognising the fact that a fair domestic market share (no more than 50 per cent?) is also an important incentive.

In the context of policy fine-tuning for increasing the export orientation of DFI, it is instructive to note the incentive for exporting services which is a relatively new formulation administered by the Economic Development Board of Singapore [ESCAP 1995:93]. To be eligible for the incentive, services must be undertaken with respect to overseas projects from Singapore base and the export level should be a minimum of 20 per cent of total revenue. The incentive is, 90 per cent of qualifying export income is exempt from income taxation for a period of five years.

Another area for fine-tuning of the Indian DFI policy arises from the fact that 'reducing labour cost' has not been indicated as an important motivating factor. This has to be reversed through a pro-active DFI policy. For instance, since the late 1960s, Singapore has been a pro-active DFI seeker. Ministers pay routine visits abroad seeking DFI even now! At the same time, very strong emphasis has been placed on maintaining Singapore's overall investment climate.

While a comparison of Singapore and India is neither fair nor tenable, a pro-active DFI policy on the part of India could help to attract inflows into relatively more labour-intensive sectors Elements of such a strategy could include suitable incentives to investors.

Policies aimed at attracting desirable and nationally beneficial DFI have to coexist alongside a certain normal or even lukewarm attitude towards DFI into least priority sectors. For instance, local builders have shown that they can put up excellent residential and non-residential buildings, notably in places like Bangalore. Is it necessary to seek/permit DFI (mostly via the so-called NRIs seeking quick capital gains) into the real estate sector? The issue needs careful examination.

Similarly, in regard to promotional seminars abroad, there is no need for frequent repeat performances in places where potential investors know enough about India. Costs of promotion have to be carefully evaluated in relation to the firm DFI commitments and actual investment inflows.

A final remark worth mentioning is that kickbacks and corruption combined with DFI will hurt the consumers in the short-run, economic reforms in the medium-term and the nation at all times. It is the duty of the central government to emphasise to all concerned that kickbacks will sooner or later become public knowledge and given the democratic traditions of India, any concerned citizen could be instrumental in reopening the cases of past corruption.

TABLE 2: MOTIVES FOR DFI FLOWS, MARKETS AND SOURCES OF MATERIAL INPUTS AS REVEALED BY FOREIGN AFFILIATES OR JAPANESE MULTINATIONALS

	Percentage of Responses in			
	Hong Kong	Singapore	Indonesia	India
Selected Motives*				
Secure natural resource supplies	1.1	2.6	5.3	5.1
Reduce labour costs	6.7	8.8	15.5	6.1
Build international networks	13.5	12.6	15.5	19.4
Sell to local market	33.2	33.9	26.2	32.7
Sell to third market	7.7	7.2	5.0	4.1
Sell to Japan	3.7	3.3	6.0	1.0

Infrastructure Sector and Withdrawal of the State

P Purkayastha

In the large-scale reorganisation that is now being introduced in the power and telecom sectors, the overriding consideration is one of ensuring profits. Concern for consumers is not on the agenda. The electric supply industry is being restructured to make it commercially viable with guaranteed profits for the private investors. Similarly, the entire thrust in telecom is how to make private entry more attractive. What is necessary is not merely to expose the current reforms as pro-monopoly and pro-multinational, as they undoubtedly are, but to project the true agenda for reforms.

THE 'new' will always be far more evocative than the 'old', particularly as the old is visible as the present with all its ugly manifestations, warts and all, while the new has the unwrinkled visage of the future. The government's current policies clothed as they are in the garb of 'new' economic policies,'reforms' and 'liberalisation' have an instinctive appeal, never mind that the 'new' is only the failed past, refurbished and presented in the emperor's new clothes.

The remarkable resonance of the government of India's policy with the Fund/Bank prescriptions has been one of the striking features of the current economics of so-called 'reforms'. The major thrust of the Bank in the 1990s is the insistence that infrastructure services should be provided largely through the private sector. The new capital investments in power and telecom should be through private capital and the existing capital base in the public sector should be rapidly privatised. Further, the market should be the major instrument guiding infrastructure services, such services being looked at merely as commodities like any other, only being perhaps a little more important. And such policy suggestions carry with it the carrot and the stick loans only to those who are willing to undertake a time bound programme of privatisation through conditionalities. The Indian government has, in addition to the above, shown some differences with the World Bank – guaranteed returns on investments as one such 'innovation' – an unerring instinct for the worst of both worlds. While the consumers are to be exposed to monopoly exploitation without any protection, the private investor will have full protection against the vagaries of the market.

World Bank and Restructuring Infrastructure

The *World Development Report 1994* on infrastructure[1] (*WDR 94*) is by no means the articulation of a new found set of convictions In the power sector for instance, the Bank had already formulated its current policy in 1992[2] – loans only for those recipients agreeing to wholesale privatisation. The *WDR 94* therefore has only brought the World Bank out of the closet and allowed its earlier more closely held views on infrastructure to be subjected to a more detailed scrutiny. Earlier, such policies as the World Bank would have liked all countries to pursue, could only be worked through willing instruments such as the Chilean government of Pinochet[3] which automatically limited their public advocacy. The *WDR 94* therefore represents the Brave New World of the 1990s, an increasingly dependent underdeveloped world, finding difficulty in retaining even a modicum of dignity before the imperious Bank.

It is important to note one issue that *WDR 94* does raise forcefully. *WDR 94* argues that the poor performance of the existing stock of capital already invested in infrastructure is development foregone. And as the capital stock rises, such loss is a significant proportion of future development. Bank's analysis of why such a situation exists and its remedy is of course a theological one – privatisation will automatically solve such problems. The real issue that needs to be addressed is how the existing capital assets can be made to deliver maximally so that we do not have to capitalise to meet demand simply because of poor 'maintenance'. In the power sector today, we are unable to meet a peak demand of about 80,000 MW at the load end with an installed capacity of 80,000 MW. Obviously, increasing capacity without addressing such issues is to pump more into a leaking vessel.

In diagnosing the malady in infrastructure sector and suggesting remedial restructuring, the World Bank has worked out a set of concepts to provide the requisite theoretical underpinning. Undoubtedly, investments in infrastructure have to be more effective. The key, according to World Bank, is the introduction of competition in infrastructure and to liberate it from government monopoly. The World Bank argues for more innovative structures of delivery of infrastructure and making the system more responsive to the stake-holders. However, it ends by arguing that if the system is made responsive to costs and prices, it will automatically become more responsive. Therefore the argument that all infrastructural services should be run on commercial lines – strictly business to be run purely for profit. The argument for competition is, however, built very thinly in the *WDR 94* as competition is entirely artificial in infrastructure and has to be introduced through regulation rather than the market. Therefore, the admission by the Bank itself that competition and stake-holders' involvement could be considered indifferent to ownership. However, based on data available, of course only to the Bank, they conclude that only private sector can provide efficient infrastructure services.

It has been widely commented that World Bank's contention regarding the efficacy of private sector in infrastructure services is not supported any independent examination of the Bank's closely held data.[4] In the absence of such an independent examination, there is little validity of such claims. The Indian experience with private investors in infrastructure does not bear out the Bank's assertion. The Brazilian experience in the telecom sector before the formation of Telebras is also similar – after the total failure of private enterprises there, the Brazilian constitution of 1988 allowed only state enterprises to enter the telecom sector.[5] In order to buttress a weak factual position, the Bank propounded the concept of "contestable markets in infrastructure" against the generally held view of infrastructure as "national monopolies". Following this, the argument that the state should withdraw to a purely regulatory role and leave the actual running of infrastructure to private hands.

There are certain issues that such theories do not address. Is it possible to have a market for infrastructure in the same way that there is a market for other commodities? Given the nature of infrastructure, it is far more likely to grow as either a monopoly or at best an oligopoly. If such an 'oligopolistic

market' does exist, what will be the impact of a supply constrained delivery of infrastructure on the price of such infrastructure? And finally, if infrastructure is seen as an independent commercial activity, what will be the impact of a high cost infrastructure on the development process as a whole?

The creation of competition in infrastructure is the underlying theoretical premise of the World Bank's case for privatisation It believes that infrastructure can be unbundled and large sectors within infrastructure brought under a competitive regime. Obviously, it would be difficult to sell the idea of a private monopoly in place of a public monopoly. Politically, it would be difficult to argue on the benign nature of private monopolies – the memories of the people are not that short that they would have forgotten that private monopolies are even more callous. In the packaging of private ownership, it is imperative therefore that it be sold along with competition. This would allow peoples' alienation from large state monopolies to be channelled for private sector entry. Once this takes place, it is a matter of time before the entire infrastructure sector passes into private hands.

Withdrawal of State from Infrastructure and Its Impact

The nature of class forces that seek to privatise infrastructure – the forces behind the Fund-Bank axis – has been analysed recently.[6] Briefly put, it has been argued that there has been a growth of liquidity in the west due to a number of factors. This liquid capital seeks to appropriate cheaply assets created in the public domain – this is the thrust behind privatisation of infrastructure the world over. In the third world, the additional impetus comes from the nature of demand. In the 1990s, the growth of electric generating capacity in the third world has overtaken that of advanced countries.[7] Similarly, in telephone switches, with a coverage of more than one phone per family in the west, the demand there has virtually saturated. The manufacturers are therefore desperate to expand in the third world.

It is not necessary to repeat the above arguments. The examination here is focused on the implications of the Fund-Bank policies on the infrastructure – particularly power and telecom. The withdrawal of the state from infrastructural services has serious consequences for the entire economy and in redressing inequitable development, both in regional and sectoral terms. Earlier, the provision of power, telecom, transport, irrigation, etc, had been considered prerequisites for economic growth. Under conditions of large supply deficits, private sector investments in infrastructure do not lead to any competition but only to growth of monopolies and consequently high cost of services. The threat of withdrawal under conditions of shortages cause the state's regulatory role to buckle. The high cost of such services means that only a handful of people are able to avail of infrastructure facilities, widening even more the social disparities. Further, such investments tend to concentrate in areas that are relatively advanced, skewing the existing regional imbalances even further. With high cost of infrastructure, access to vital requirements for industrial and agricultural growth are further constrained, leading to increase of existing disparities and lower growth. Construction of 'safety nets' as advocated, are merely palliatives and no solution to such disparities. The high cost of infrastrucutre makes it difficult for third world economies to be competitive internationally.

The arguments advanced above are not new. It was with this perspective that the state was forced to intervene in infrastructure services. In India, the power companies were largely in private hands and had very little will or inclination to expand electric supply. It was in this context that the Indian state entered power development in a big way from the 1960s to enable industrial and agricultural growth. In Brazil, there were a large number of private companies that were active in the telecom sector. However, the abysmal quality of service forced the Brazilian state to intervene and create Telebras which finally took over the entire telecom services sector. In 1988, the Brazilian parliament passed its constitution, incorporating the provisions that only the state and state-run entities can offer telecom services.[8] The South Korean example is also very similar where the private sector in power generation had to be nationalised in the 1960s due to its repeated failures. The current Workd Bank solutions are therefore not a new perspective of infrastructure but the repetition of a strategy that had already failed earlier. The only new element is the proposal of unbundling infrastructure in each area and introducing competition.

The introduction of competition in infrastructure and privatisation will automatically ensure economic efficiencies hitherto lacking in the state-run public utilities – this is the core of the Fund-Bank argument. The degree of competition is therefore crucial to the argument and unbundling of infrastructure is a prerequisite to the introduction of competition. The utilities have generally been considered natural monopolies and competition has been historically absent in these sectors. The 1980s have seen a re-look at some of these fundamental premises and it is now being argued that competition is possible in these areas provided the state and regulatory authorities help in introducing competition. Anti-trust action in US and concepts like 'transmission access' have opened the way for more players in power generation,[9] telecom,[10] etc. In UK, ideological imperatives led to restructuring of the power and telecom sectors introducing a certain element of unbundling and competition. The restructuring globally of the 1990s owe their origins to these actions in US and UK. We examine below the current reforms that are taking place in the advanced countries in order to examine the validity of such concepts for India and the third world.

Utilities like power, telecom, etc, have clearly defined economies of scale. Further, the integration of a power grid makes it possible for smaller margins to be maintained in the system and a much greater security of the overall power system. Transmission and distribution networks have generally been a part of such vertically integrated utilities. The transmission and distribution networks require 'right of the way' that had to be legislated by the state. It is easy to show that it is prohibitively expensive to duplicate an existing distribution network. The transmission system has very large economies of scale and costs of incremental increases are much lower than putting up independent transmission lines. The ownership of the transmission and distribution networks led to the growth of monopolies, as the owners of the networks could freeze out any new power generator. Worldwide, the power systems were such vertically integrated monopolies. In US these monopolies were private while in most parts of the world they were state-run utilities.

The reforms in 1980s changed the above picture substantially.[11] Under the Thatcherite reforms in UK, the distribution systems, the power transmission system and the power generators were unbundled into separate independent organisations.[12] These organisations were then privatised. Any power generator could then get transmission access and supply to any distribution agency, or even to a large user. In US, the utilities were privately owned and were asked to provide transmission access to Independent Power Producers (IPPs) leaving their original ownership pattern and vertically integrated structure virtually intact. The introduction of limited competition in generation in US and UK came only after the possibilities of technical efficiency improvements in the system through integration had been exhausted. The method chosen in US was to force the utilities to buy power at avoided costs. In

UK, power quotations are given every day for the next day and the regional power distributing authorities choose the lowest bidders for their next day's sources.

The Bank prescriptions and the current drive towards transferring public utilities to private hands have UK as the role model, even though the market in UK has not developed any real competition. It is dominated by two major generators - National Power and PowerGen. The resulting duopoly has resulted in high price of power and huge profits to the electric supply industry.[13] As the transmission and distribution are in any case monopolies, the case for competition exists only for the generators. In US, the utilities set up separate companies as independent power producers. Under the PURPA legislation formulae of avoided costs, there were price advantages to newer generating entities if set up under the guise of independent power producers. The case for competition having benefited the consumer is not supported by facts in either UK or US. The anger of the people in UK over the monopoly prices and consequent huge profits made by the power companies is a clear indication of this. Nevertheless, it has now become an article of faith for the Bank-Fund school and their monetarist followers that competition inevitably lowers prices, even if it is not borne out by events.

However, while the consumer has not seen a lowering of power costs due to competition, the change of the ownership in the case of UK and examination of costs of new power generation in US as a fall-out of PURPA Act, did lead to scrapping of nuclear power plants for both US and UK. It became clear that the vertically integrated monopolies had been able to hide the high cost of nuclear power, particularly capital servicing and decommissioning costs. Though UK and US had a highly efficient electric supply industry based on technical parameters, they had significantly higher costs due to the uneconomic nuclear option they had both heavily relied on. As these costs were lumped with the rest of the system and not transparent, they could continue on this path for quite some time. The nuclear route was abandoned once the pricing of alternative sources of power became clear and the actual decommissioning costs were taken into account. In economic terms, though the productive efficiencies of the utilities were high, the allocative efficiencies were low. The allowing of limited competition in US and dismantling the existing structure in UK had therefore this unintended benefit. More so when it is realised that the arguments for privatisation and competition had been based on increase of productive and commercial efficiencies and not allocative efficiencies. In UK, before privatisation it was expected that the nuclear power portion of erstwhile CEGB would attract a large number of bidders. In reality, this proved the least attractive to the investors.[14]

Monopoly in telecom has again its origins in the economies of scale and 'right of the way' legislation created earlier. The telephone companies were vertically integrated monopolies, having long distance as well as local telephony. Apart from North America and a few isolated cases, the telecom sector was generally in government hands. In US, it was with AT and T, who were also switch manufacturers, introducing an extra element of monopoly. The equipment manufacturing, the long distance and local telephony were all with the same company. The technological changes introduced in the 1980s was to change this picture. It became possible to ride piggy-back on a telephone network to provide other services - E-mail, data services, etc. These are called value added services. Technologically, it also became possible to provide voice telephony through other routes - wireless, satellites, etc. The monopoly power of the telephone companies was perceived to be a threat, particularly as more and more economic activity hinged upon the new communication methods. Unbundling was the first step. Value added services were offered by others either through leased lines or through dial up facilities. Separation of long distance from the local services was the next step. In US and UK, limited competition has now been introduced in long distance telephony. However, apart from very limited competition in UK, no country has allowed parallel local operators through local land-based network. The economies of providing an extra connection in an existing network prohibit such a duplication, apart from the problem introducing another operator with its right of the way.

Competition in telecom service, particularly local voice telephony, is generally being introduced using alternative technologies. Thus wireless, either fixed or mobile (cellular), and the cable network can be used to provide competition to land-based networks. As the telcom sector is regulated, the current regulatory and legal battles are allowing cable operators to enter telephony and the telphone companies to enter cable TV using their existing networks. Here also, the Indian twist is to try and create a parallel land-based local network - a wasteful duplication of scarce capital resources that has not been attempted even in advanced countries with much higher revenues per line.

Unbundling Natural Monopolies and Rebalancing Costs

The key to unbundling natural monopolies and introducing competition is regulation. Unlike other areas, where one can argue that regulation is required to prevent monopolies, in infrastructural areas, competition can only be enforced through regulation. The introduction of Mercury as a competitor to British Telecom was a political decision of the Thatcher government. Mercury is a classic case of artificial competition. It was created by Margaret Thatcher's government by bringing together Cable and Wireless, British Petroleum and Barclays' Merchant Bank. It was a planned government initiative. And to make it succeed, British Telecom was forced to carry all the social subsidies while Mercury secured a segment of the most lucrative long distance traffic. Mercury's competitive edge was really the British government's intervention on its behalf - intervening in the market in order to prove that markets are best judges of performance. The US regulatory scenario is no different. If the regulator does not impose the terms for competition, the larger and more established operators would easily freeze out new entrants. Countries like New Zealand, who believed in their wide-eyed optimism in the beneficial effects of open competition, have learnt to their cost that without regulation there cannot be any effective competition either.[15]

Similarly, in the power sector, there is a need to match grid withdrawals with power generation. Co-operation is a necessity and the natural state for the electric supply industry and competition can only be introduced with regulation.[16] Thus the regulator must ensure that the power generator is able to get access to the electrical network of others at a reasonable cost. Again, competition has to be introduced artificially in the system.

An essential part of introducing such regulated competition is to price each sector of infrastructural sector of services and disallow cross subsidies. As competition can only be introduced in certain parts of the hitherto integrated infrastructural services, each such segment must be priced independently. To make for fair competition, each segment has to be commercially viable and using revenues from one area of activity for another area of operation is forbidden by the regulator. Therefore unbundling infrastructure goes hand-in-hand with removal of cross subsidies.

Cross subsidies are not only a part of state-run monopolies but provide the underpinning for all infrastructural services, whether private or state run. There is a sharp difference here between economic sense and commercial sense. If cross subsidies are withdrawn, rural electrification or rural telephony is not viable. Yet, providing these facilities to rural areas is not only a social obligation but makes hard economic sense. The

provision of cheap electricity and extension of the rural electrification programme had much to do with the food securtiy we have achieved today. Similarly, if the rural areas and semi-urban areas are connected by a good telecom network and provided with secure electricity supply, the resulting development would correct the gross regional disparities and the pressure on urban areas. However, none of these can be justified commercially from the stand point of the electric supply industry or the telecom sector but have to be imposed externally on the infrastructure provider for larger economic and social goals.

The second sets of cross subsidies pertain to provision of low access costs for infrastructure Commercially, the larger consumers should get a discount on electricity prices or on their telephone bills. However, generally, the infrastructure services are provided at low initial costs with higher costs for higher usage slabs. Thus telephone connections are provided at very low costs and the first few calls are charged at lower rates Similarly, the electricity connection is provided at low initial costs. A commercially viable outlook would make the access costs so high that these would be the privilege of only the elite. This deprivation of services would be a fetter on development as larger and larger sections would lose their ability to compete for development. And this would ultimately hamper the growth of demand in these infrastructural sectors.
